<u>The USPTO must be taking cues from the Trump White House and its love for a daily dose of drama. We just learned from a few well-connected sources (now I sound just like the New York Times) that the new Commerce Secretary, Wilbur Ross, has been quietly interviewing candidates to replace current Director, Michelle Lee, an insider for Google thought by most to be a DNC shill who was placed inn the USPTO to protect Google, who has been in and out of the job so many times since January that we stopped keeping score. Apparently, the leading candidates are still the same individuals that we reported on a few months ago, i.e. Phil Johnson, former VP IP Strategy at J&J, and former IPO president, as well as former Chief justice of the Federal Circuit, Randall Rader. Both are well regarded in the IP community and proponents of a strong patent system to support innovations and investment. Each would be a breath of fresh air to an agency that has gone from a patent issuing to a patent killing machine over the last years. Invalidation rates still hover at 70%+ for patents challenged via the PTAB. We will keep you posted as this story unfolds, but this is undoubtedly a positive development if you are an inventor or patent owner. It also comes on the heels of an announcement a few days earlier that Director Lee was forming a â workinggroupâ on regulatory reform. Under a new director, this group could now become a conduit to seriously revisit the entire post-grant review (like IPRs) mess that the America Invents Act has created.....</u>	1279

Scott Borgerson, the tech CEO tied to Jeffrey Epstein alleged madam, Ghislaine Maxwell and Eric Schmidt.....

<u>Scott Borgerson, 44, is the CEO of CargoMetrics, a data-analytics company for maritime trade and shipping. He cofounded the Boston-based company in 2010, and it was most recently valued at \$100 million in 2016.....</u>	2369
<u>Borgerson's company has raised nearly \$23 million from investors, which include former Google CEO Eric Schmidt. Schmidt led a \$10 million funding round for CargoMetrics in August 2017, according to PitchBook.....</u>	2370
<u>Borgerson owns an oceanfront property, reportedly worth \$3 million, in Manchester-by-the-Sea, Massachusetts. Manchester-by-the-Sea is a small town north of Boston with a population of just over 5,000 people.....</u>	2370
<u>The Daily Mail reported in August 2019 that Borgerson was dating and housing Ghislaine Maxwell, Jeffrey Epstein's alleged madam who had largely remained out of the public eye. Maxwell was close to Epstein, and reportedly recruited underage girls for Epstein and participated in their abuse.....</u>	2370
<u>The Daily Mail also reported Maxwell had become a "homebody" who was "hiding out" at Borgerson's home, and that the pair have been dating for around five years. However, Borgerson denied the report to Business Insider at the time, and said Maxwell was a "former friend.".....</u>	2370
<u>Borgerson also told Business Insider he was away on business for the week, and that no one had been staying at his Massachusetts home. A day later, Maxwell was spotted at an In-N-Out Burger in Los Angeles.....</u>	2370
<u>The Daily Mail also captured photos it claims show Borgerson walking Maxwell's dog in Boston. However, Borgerson told Business Insider that the dog in the photographs is actually his, and his name is Secretary Hamilton â named after Founding Father Alexander Hamilton.....</u>

**GOOGLE CENSORS ANYBODY THAT ERIC SCHMIDT
DOES NOT AGREE WITH**

GOOGLE blacklists Natural News | removes 140,000 pages from its index | memory holes | Natural News investigative articles on vaccines, pharma corruption, fraudulent science and more

by: [Mike Adams](#)

Tags: [Big Pharma](#), [Blacklisted](#), [Censorship](#), [free speech](#), [globalists](#), [Google](#), [investigations](#), [Journalism](#), [Natural.news](#)

([Natural News](#)) Late last week, I received a direct threat that warned [if I did not take steps to destroy Alex Jones and InfoWars](#), I would be targeted for destruction in a campaign of smears, censorship and defamation.

Instead of giving in to the enemy, I refused to take the bait and went public with details of the threat, warning everyone in the new media that sinister forces were now being pursued to undermine and silence every anti-establishment (and pro-Trump) voice on the internet.

NEW: [Sign this White House petition NOW](#) to halt Google's outrageous censorship of Natural News, InfoWars and other independent media publishers.

True to form, today the entire Natural News website has been **blacklisted by Google**, entirely without warning. This is just one of many censorship events that have all taken place over the last few days:

- Last weekend, damning videos were leaked in [a focused effort to take out Milo Yiannopoulos](#), a former Breitbart News editor and gay conservative who has openly supported President Trump. Milo was hit with an attack wave of "opposition research" and was forced to resign from Breitbart on Monday, citing the "cynical media witch hunt" that brought him down.
- Yesterday, [InfoWars was blackballed by AdRoll.com](#), an online advertising distribution company. According to Alex Jones, the blacklisting by AdRoll will cost InfoWars \$3 million in annual revenues, possibly causing InfoWars to abandon plans of opening a Washington D.C. bureau to cover the Trump administration with real news (instead of the fake news from CNN and elsewhere).
- The Shopify e-commerce platform was aggressively threatened by organized Leftists to dump the Breitbart online store and thereby deny revenues to Breitbart. Shopify's CEO [refused to kow-tow to the intimidation and censorship](#) and has maintained a "neutral" position on political issues, focusing on running e-commerce platforms for everyone.
- Today, Natural News has been hit by Google, which has **blacklisted the entire Natural News domain** and removed over 140,000 pages from its index. The take down of Natural News happened this morning, and it follows a **pattern of censorship** we're seeing being leveled against other pro-Trump websites. Google sent no warning whatsoever to our "webmaster tools" email address on file with them. The shut off of Natural News was clearly driven by a **human decision**, not an algorithm. We're currently attempting to determine Google's claimed justification for censoring our entire website, and we hope to have NaturalNews.com restored in Google's index.

Some of the news now being censored by Google includes our laboratory testing of the U.S. water supply, where [we conducted laboratory testing to discover that 6.7% of municipal water is contaminated with toxic metals](#). Google has also blacklisted our announcement of [free laboratory testing services for Native American water supplies](#) impacted by oil pipeline leaks. Also blacklisted is our [exclusive coverage of the GlaxoSmithKline criminal indictment](#) by the U.S. Justice Dept. and our interview with the whistleblower who helped achieved a record \$3 billion settlement with the criminal drug company.

Apparently, Google believes the public should no longer have access to these investigative journalism articles; and 139,997 more articles that cover activism, science frauds, drug industry criminality, political corruption and more. You are witnessing a **modern-day book burning** by the *internet Gestapo* that now decides what knowledge you're never allowed to access; especially because much of that knowledge can help set humanity free.

I describe it in more detail in this podcast: (article continues below)

Silencing Natural News is all part of the globalist â scriptâ for the enslavement of a population kept ignorant of reality

[Natural News](#) is, of course, one of the worldâs top educational and activism sources exposing the lies of dangerous medicine, toxic mercury in vaccines, the corporate-quack science behind GMOs, cancer industry fraud and so on. By providing truthful, empowering and passionate information to the public, we **harm the profit model of the corrupt medical cartels** that fund the media, lobby the government and influence internet gatekeepers with advertising money. (Google has already declared war on natural medicine and nutritional supplements, all but banning them from being advertised on Google AdSense.)

The removal of Natural News from Googleâs index means that **millions of people may now be unnecessarily harmed by toxic medicines, herbicides and brain-damaging mercury in vaccines** because they are being denied the â other side of the storyâ thatâs censored by the corporate-controlled media. By censoring Natural News, Google is, in effect, **siding with the criminal pharmaceutical industry** that has been charged with multiple felony crimes and [caught bribing doctors](#), fraudulently [altering scientific studies](#), conducting [medical experiments on children](#) and [price fixing their drugs](#) to maximize profits.

In effect, censorship of Natural News is part of the establishmentâs **war on humanity** which includes [depopulation measures](#) (Bill Gates), [covert infertility vaccines](#), corporate-run media disinfo campaigns and a full-on assault against scientific truth and free speech conducted in the public interest.

With the attacks on Milo, InfoWars and Natural News, what you are witnessing right now is the **coordinated silencing of every voice that opposes the corrupt, globalist establishment**. All such voices are being â memory holedâ in the run-up to an attempted Orwellian-style domination over all information run by Facebook, Google, Yahoo, Twitter and other internet gatekeepers. This is all by design. It is nefarious, sinister and represents nothing less than the **final desperate assault to enslave humanity by silencing truth**.

Targeted by anti-Trump globalists

Itâs clear to me that Natural News is being targeted primarily because of our support for President Trump and his review of vaccine safety. It is now apparent that any person who engages in **real science**, critical thinking or any attempt to protect children from the brain damaging effects of mercury in vaccines is going to be silenced, discredited, smeared and blacklisted. This is an astonishing realization about the depths of total corruption in society today and how the medical cartels control information to maximize their profits off human suffering.

Note that if I had agreed to betray my colleagues and agree to participate in a smear campaign against Alex Jones, everything would have been fine with Natural News and you wouldnât see the attacks being waged against us. The tactic now being pursued by the establishment is, â Join the Dark Side or be destroyed.â

I won't ever join the Dark Side, which means I will be silenced. The message from Google and other information gatekeepers is now clear: **Obediently conform to the status quo or you will be banished from the digital realm.**

This is, in essence, nothing less than a **modern-day book burning** by anti-human globalists who are determined to keep humanity ignorant (and diseased).

The real agenda of the humanity-hating globalist agenda is now on full display: It's about **total domination over all information** so that humanity never learns that [cancer can be prevented with vitamin D](#), or that [glyphosate herbicide causes cancer](#), or that [statin drugs are a multi-billion-dollar medical scam](#). The Sheeple are all slated to be sacrificed upon the altar of Big Pharma profits, and anyone who dares stand in their way will be eliminated by any means necessary.

What you can do to fight this brazen censorship and assault being waged against humanity

First off, **stop using anti-truth internet gatekeepers** like Google, Facebook, Yahoo and Twitter. They are quietly controlling your thoughts, ideas and beliefs by limiting your access to valuable resources like Natural News.

Second, use [GoodGopher.com](#) as your search engine, as it provides you with **uncensored search results** from thousands of independent media websites (many of which are banned or penalized by Google).

Third, **bookmark [NaturalNews.com](#)** in your browser and check it at least twice daily (we post new content each morning and each evening). Manually type it into your browser if you have to. From now on, never rely on some other gatekeeper to bring you to Natural News, because those gatekeepers are censoring all our content.

Be sure to also [sign up to our email newsletter](#) using the form below. This email newsletter is one of the best ways we can reach you without being filtered out by other sources. As you might expect, Gmail censors our newsletters too, so don't use a Gmail email address. (Yes, the censorship is an all-out assault.)

Finally, make [Censored.news](#) a primary resource to watch for breaking news on important events that are being censored by the fake news media (CNN, WashPo, NYT, etc.).

Finally, **prepare for total war on humanity**. I'm being told from other sources that the "final solution" is coming soon from the globalists, and it's going to be unleashed as an all-out war against Trump, liberty, free speech, natural medicine and every individual who dares stand up and speak the truth against the lying globalists and their fake news minions. The reason they are silencing Natural News, InfoWars and other outlets is because they are preparing for a **very big false flag assault** and they don't want independent media websites to be able to counter the "official" news narrative.

I'm serious. Get ready. It's all coming down soon.

GOOGLE CEO AND BOARD OF DIRECTORS ARE LYING PIECES OF CRAP

- They lied to their employees about sex extortion, sex slaves, domestic spying, political manipulation, their Mafia club and their true goals.
- They lie to the public about everything!
- They lied to Congress about what they really do, as revealed in the documentary: THE CREEPY LINE
- Over 1000 sex abuse and misogyny charges by employees and contractors covered up by Google executives
- India has a well documented "Rape-supportive culture" and Google allows Indian executives to promote a corporate "rape culture" within Google, YouTube, Alphabet and all of their holdings
- Pathetic politicians do nothing to regulate Google's off-the-charts corruption because Google has bribed most of Congress with sex, Dark Money, search engine rigging and campaign cash.
- Google executives die on their "sex yachts" in drug fueled orgies, sexually extort employees, own "sex penthouses", organize sex clubs and escort "discounts" and force young male staff into gay liaisons.
- Google executives have proven, beyond a shadow of a doubt, that they will lie, lie and lie again to keep their COVER-UPS going!

GOOGLE CLAIMS IT DIDNT MANIPULATE SEARCH RESULTS FOR ISLAM AND MUSLIM

But we have known for well over a year that it did.

[Robert Spencer](#)

[35](#)

Now that even President Trump has complained about Google manipulating its search results, the social media giant's underhanded practices are finally getting some attention. A [Fox News](#) report Friday noted that at Google, internal emails show conversations between employees highlighting a desire to manipulate search results on the heels of President Trump's controversial travel ban in order to mute conservative viewpoints and push ways to combat the ban. Google claims that this remained on the level of discussion, and wasn't implemented, but there is considerable evidence to the contrary.

The emails show that Google employees suggested ways to leverage the search engine to combat what the tech giant staffers considered anti-immigration rhetoric and news. Specifically, Google staffers suggested actively countering islamophobic, algorithmically biased results from search terms like Islam, Muslim, Iran, etc. But all is well, Google would have us believe, because this wasn't done.

Really? But we already knew that Google was manipulating search results for words such as â Islamâ and â Muslim.â We have known for quite some time. On July 26, 2017, Turkeyâ s state-run news outlet [Anadolu Agency reported](#):

Googleâ s first page results for searches of terms such as â jihadâ , â shariahâ and â taqiyyaâ now return mostly **reputable** explanations of the Islamic concepts. Taqiyya, which describes the circumstances under which a Muslim can conceal their belief in the face of persecution, is the sole term to feature a **questionable** website on the first page of results.

â Reputableâ according to whom? â Questionableâ according to whom?

Google was bowing to pressure from Texas imam Omar Suleiman, who led an initiative to compel Google to skew its results. Apparently Google didnâ t consider whether those who were demanding that search results be manipulated in a particular direction might have had an ulterior motive. Could it have been that those who were pressuring Google wished to conceal certain truths about Islam that they preferred non-Muslims not know?

â Queries about Islam and Muslims on the worldâ s largest search engine have been updated amid public pressure to tamp down alleged disinformation from hate groups,â Anadolu Agency reported. Google could have performed a bit of due diligence to determine if sources being tarred as â hate groupsâ actually deserved the label, and if the Hamas-linked Council on American-Islamic Relations (CAIR) and the hard-Left smear propaganda organization the Southern Poverty Law Center (SPLC), both of which are invoked in the Anadolu article, were really reliable and objective arbiters for defining â hate groups.â Google could have tried to determine whether or not the information it was suppressing was really inaccurate. Instead, Google swallowed uncritically everything Omar Suleiman and his allies said.

Despite his success, Suleiman still isnâ t satisfied:

One leading activist in favor of Google modifying its results told Anadolu Agency he noticed the updated search results and thanked the company for its efforts but said â much still needs to be done.â He claimed that Google has a responsibility to â combat â hate-filled Islamophobiaâ similar to how they work to suppress extremist propaganda from groups like Daesh and al-Qaeda."

This should have made Google executives stop and think.

The Islamic State (Daesh) and al-Qaeda slaughter people gleefully and call openly for more mass murders. There is no corresponding â Islamophobicâ terror organization. There have been over 30,000 lethal jihad attacks worldwide since 9/11, and no remotely corresponding wave of â Islamophobicâ violence. CAIR and the SPLC claim in the Anadolu Agency article that supposedly â Islamophobicâ rhetoric has led to a rise in hate crimes against Muslims, but this is not supported by a scintilla of evidence.

When Suleiman equated critical words about Islam with the direct exhortations to murder emanating from actual murderers, Google should have realized that Suleiman had an agenda and wasnâ t being honest. Yet he tried to pose as an impartial arbiter: â Suleiman said Google should differentiate between â criticism of Islam and hate-filled Islamophobiaâ , emphasizing the religion should **not be infringed upon**.â

Suleiman is granting that acceptable criticism of Islam is different from â hate-filled Islamophobia.â But if that is so, then the religion *can* be â infringed uponâ by this legitimate criticism, no? Or if the claim that Islam must not be â infringed uponâ means that it cannot be criticized, why is that so of Islam but no other religion?

Suleiman says: â I donâ t think Google has a responsibility to portray Muslims positively. I think Google

has a responsibility to weed out fear-mongering and hate groups but I don't want Google to silence critique of Islam, or critique of Muslims.

The problem with this is that neither Suleiman, nor Hamas-linked CAIR, nor anyone else who has ever said that there was a distinction between legitimate criticism of Islam and "hate-filled Islamophobia" has ever identified *anyone* they think is a legitimate critic of Islam without being "Islamophobic."

Through 18 books, thousands of articles, and over 60,000 blog posts at [Jihad Watch](#), I have attempted to present a reasonable, documented, fair, and accurate criticism of Islam and explanation of the jihad doctrine. Nevertheless, I've been tarred as a purveyor of "hate-filled Islamophobia" by groups and individuals that have never given my work a fair hearing, and have read it only to search for "gotcha!" quotes they could wrench away from their obviously benign meaning in order to claim I was stating something hateful.

This doesn't happen only to me. It happens to anyone and everyone who dares to utter a critical word about Islam or jihad, wherever they are on the political spectrum.

This experience, reinforced countless times over a decade and a half, makes me extremely skeptical when Omar Suleiman says that he doesn't want Google to silence critique of Islam. If he could produce a critique of Islam that he approved of, my skepticism might lessen. But he won't, and can't.

It seems much more likely that he pressured Google to skew its results so as to deep-six criticism of Islam. Probably, knowing that he couldn't reveal he was trying to bring Google into compliance with Sharia blasphemy laws forbidding criticism of Islam, he told them instead that he wasn't against criticism of Islam as such, but only against "hate-filled Islamophobia."

And they fell for it, making their present claims not to have skewed searches on Islam ring hollow.

GOOGLE CONTROLS GOVERNMENT, THE LAW, SURVEILLANCE AND THE NEWS

Google.gov

Amid growing calls to break up Google, are we missing a quiet alignment between â smartâ government and the universal information engine?

[Adam J. White](#)

Google exists to answer our small questions. But how will we answer larger questions about Google itself? Is it a monopoly? Does it exert too much power over our lives? Should the government regulate it as a public utility â or even break it up?

In recent months, public concerns about Google have become more pronounced. This February, the *New York Times Magazine* published â [The Case Against Google](#),â a blistering account of how â the search giant is squelching competition before it begins.â The *Wall Street Journal* published a similar article in January on the â [antitrust case](#)â against Google, along with Facebook and Amazon, whose market shares it compared to Standard Oil and AT&T at their peaks. Here and [elsewhere](#), a wide array of reporters and commentators have reflected on Googleâ s immense power â not only over its competitors, but over each of us and the information we access â and suggested that the traditional antitrust remedies of regulation or breakup may be necessary to rein Google in.

Dreams of war between Google and government, however, obscure a much different relationship that may emerge between them â particularly between Google and progressive government. For eight years, Google and the Obama administration forged a uniquely close relationship. Their special bond is best ascribed not to the revolving door, although hundreds of meetings were held between the two; nor to crony capitalism, although hundreds of people have switched jobs from Google to the Obama administration or vice versa; nor to lobbying prowess, although Google is one of the top corporate lobbyists.

Rather, the ultimate source of the special bond between Google and the Obama White House â and modern progressive government more broadly â has been their common ethos. Both view societyâ s challenges today as social-engineering problems, whose resolutions depend mainly on facts and objective reasoning. Both view information as being at once ruthlessly value-free and yet, when properly grasped, a powerful force for ideological and social reform. And so both aspire to reshape Americansâ informational context, ensuring that we make choices based only upon what they consider the right kinds of facts â while denying that there would be any values or politics embedded in the effort.

[Follow *The New Atlantis*](#) Addressing an M.I.T. sports-analytics conference in February, [former President Obama said](#) that Google, Facebook, and prominent Internet services are â not just an invisible platform, but they are shaping our culture in powerful ways.â Focusing specifically on recent outcries over â fake news,â he warned that if Google and other platforms enable every American to personalize his or her own news sources, it is â very difficult to figure out how democracy works over the long term.â But instead of treating these tech companies as public *threats* to be regulated or broken up, Obama offered a much more conciliatory resolution, calling for them to be treated as public *goods*:

I do think that the large platforms — Google and Facebook being the most obvious, but Twitter and others as well that are part of that ecosystem — have to have a conversation about their business model that recognizes they are a public good as well as a commercial enterprise.

This approach, if Google were to accept it, could be immensely consequential. As we will see, during the Obama years, Google became aligned with progressive politics on a number of issues — net neutrality, intellectual property, payday loans, and others. If Google were to think of itself as a genuine public good in a manner calling upon it to give users not only the results they want but the results that Google thinks they *need*, the results that informed consumers and democratic citizens *ought* to have, then it will become an indispensable adjunct to progressive government. The future might not be *U.S. v. Google* but *Google.gov*.

â To Organize the Worldâ s Informationâ

Before thinking about why Google might begin to embrace a role of actively shaping the informational landscape, we must treat seriously Googleâ s stated ethos to the contrary, which presents the companyâ s services as merely helping people find the information theyâ re looking for using objective tools and metrics. From the start, Google had the highest aspirations for its search engine: â A perfect search engine will process and understand all the information in the world,â co-founder Sergey Brin announced in a [1999 press release](#). â Googleâ s mission is to organize the worldâ s information, making it universally accessible and useful.â

Googleâ s beginning is a story of two idealistic programmers, Brin and Larry Page, trying to impose order on a chaotic young World Wide Web, not through an imposed hierarchy but lists of search results ranked algorithmically by their relevance. In 1995, five years after an English computer scientist [created](#) the [first web site](#), Page arrived at Stanford, entering the computer science departmentâ s graduate program and needing a dissertation topic. Focusing on the nascent Web, and inspired by modern academiaâ s obsession with scholarsâ citations to other scholarsâ papers, Page devised BackRub, a search engine that rated the relevance of a web page based on how often other pages link back to it.

Because a web page does not itself identify the sites that link back to it, BackRub required a database of the Webâ s links. It also required an algorithm to rank the relevance of a given page on the basis of all the links to it â to quantify the intuition that â important pages tend to link to important pages,â as Pageâ s collaborator Brin put it. Page and Brin called their ranking algorithm PageRank. The name PageRank â was a sly vanity,â Steven Levy later observed in his 2011 book [In the Plex](#) â â many people assumed the name referred to web pages, not a surname.â

Page and Brin quickly realized that their projectâ s real value was in ranking not web pages but results for searches of those pages. They had developed a search engine that was far superior to AltaVista, Excite, Infoseek, and all the other now-forgotten rivals that preceded it, which could search for words on pages but did not have effective ways of determining the inherent importance of a page. Coupled with PageRank, BackRub â which would soon be renamed Google â was immensely useful at helping people find what they wanted. When combined with other signals of web page quality, PageRank generated â mind-blowing results,â writes Levy.

Wary of the fate of Nikola Tesla â who created world-changing innovations but failed to capitalize on them â Page and Brin incorporated Google in September 1998, and quickly attracted investors. Instead of adopting the once-ubiquitous â banner adâ model, Google created AdWords, which places relevant advertisements next to search results, and AdSense, which supplies ads to other web sites with precisely calibrated content. Google would find its fortune in these techniques â which were major innovations in their own right â with [\\$1.4 billion](#) in ad revenue in 2003, ballooning to \$95 billion last year. Google â

recently reorganized under a new parent company, Alphabet — has continued to develop or acquire a vast array of products focused on its original mission of organizing information, including Gmail, Google Books, Google Maps, Chrome, the Android operating system, YouTube, and Nest.

In Google We Trust

Page and Brin's original bet on search has proved world-changing. At the outset, in 1999, Google was serving roughly a billion searches per year. Today, [the figure runs](#) to several billion per *day*. But even more stark than the absolute number of searches is Google's market share: According to the [January Wall Street Journal article](#) calling for antitrust action against Google, the company now conducts 89 percent of all Internet searches, a figure that rivals Standard Oil's market share in the early 1900s and AT&T's in the early 1980s.

But Google's success ironically brought about challenges to its credibility, as companies eager to improve their ranking in search results went to great lengths to game the system. Because Google relied on — objective — metrics, to some extent they could be reverse-engineered by web developers keen to optimize their sites to increase their ranking. — The more Google revealed about its ranking algorithms, the easier it was to manipulate them, — writes Frank Pasquale in [The Black Box Society](#) (2015). — Thus began the endless cat-and-mouse game of — search engine optimization, — and with it the rush to methodological secrecy that makes search the black box business that it is.

While the original PageRank framework was explained in Google's patent application, Google soon needed to protect the workings of its algorithms — with utmost confidentiality — to prevent deterioration of the quality of its search results, writes Steven Levy.

But Google's approach had its cost. As the company gained a dominant market share in search ... critics would be increasingly uncomfortable with the idea that they had to take Google's word that it wasn't manipulating its algorithm for business or competitive purposes. To defend itself, Google would characteristically invoke logic: any variance from the best possible results for its searchers would make the product less useful and drive people away, it argued. But it withheld the data that would prove that it was playing fair. Google was ultimately betting on maintaining the public trust. If you didn't trust Google, how could you trust the world it presented in its results?

Google's neutrality was critical to its success. But that neutrality had to be accepted on trust. And today — even as Google [continues to reiterate its original](#) mission — to organize the world's information, making it universally accessible and useful — that trust is steadily eroding.

Google has often stressed that its search results are superior precisely because they are based upon neutral algorithms, not human judgment. As Ken Auletta recounts in his 2009 book [Googled](#), Brin and then-CEO Eric Schmidt — explained that Google was a digital Switzerland, a — neutral — search engine that favored no content company and no advertisers. — Or, as Page and Brin wrote in the [2004 Founders Letter](#) that accompanied their initial public offering,

Google users trust our systems to help them with important decisions: medical, financial, and many others. Our search results are the best we know how to produce. They are unbiased and objective, and we do not accept payment for them or for inclusion or more frequent updating.

But Google's own standard of neutrality in presenting the world's information is only part of the story, and there is reason not to take it at face value. The standard of neutrality is itself not value-neutral but a moral standard of its own, suggesting a deeper ethos and aspiration about information. Google has always

understood its ultimate project not as one of rote descriptive recall but of *informativeness* in the fullest sense. Google, that is, has long aspired not merely to provide people the information they ask for but to guide them toward informed choices about what information they are seeking.

Put more simply, Google aims to give people not just the information they *do* want but the information Google thinks they *should* want. As we will see, the potential political ramifications of this aspiration are broad and profound.

“Don’t Be Evil,” and Other Objective Aims

Google is not a conventional company. We do not intend to become one. So opened that novel Founders Letter accompanying Google’s 2004 IPO. It was hardly the beginning of Page and Brin’s efforts to brand theirs as a company apart.

In July 2001, after Eric Schmidt became chairman of the board and the month before he would become CEO, Page and Brin had gathered a small group of early employees to identify Google’s core values, so that they could be protected through the looming expansion and inevitable bureaucratization. As John Battelle describes it in his 2005 book [The Search](#):

The meeting soon became cluttered with the kind of easy and safe corporate clichés that everyone can support, but that carry little impact: Treat Everyone with Respect, for example.... That’s when Paul Buchheit, another engineer in the group, blurted out what would become the most important three words in Google’s corporate history.... All of these things can be covered by just saying, Don’t Be Evil.

Those three words became a cultural rallying call at Google, initially for how Googlers should treat each other, but quickly for how Google should behave in the world as well. The motto exerted a genuine gravitational pull on the company’s deliberations, as Steven Levy recounts: An idea would come up in a meeting with a whiff of anticompetitiveness to it, and someone would remark that it sounded ... *evil*. End of idea.

To Googlers, Levy notes, the motto was a shortcut to remind everyone that Google was *better* than other companies. This also seems to have been the upshot to Google’s rivals, to whom the motto smacked of arrogance. Well, of course, you shouldn’t be evil, Amazon founder Jeff Bezos told Battelle. But then again, you shouldn’t have to brag about it either.

Google’s founders themselves have been less than unified about the motto over the years. Page was at least equivocally positive in an interview with Battelle, arguing that “Don’t Be Evil” is much better than Be Good or something. But Brin (with Page alongside him) [told attendees](#) of the 2007 Global Philanthropy Forum that the better choice indeed would have been “Be Good,” precisely because “ultimately we’re in a position where we do have a lot of resources and unique opportunities. So you should not be evil and also take advantage of the opportunity you have to do good.” Eric Schmidt, true to form as the most practical of Google’s governing troika, gives the slogan a pragmatic interpretation in his 2014 book [How Google Works](#):

The famous Google mantra of “Don’t be evil” is not entirely what it seems. Yes, it genuinely expresses a company value and aspiration that is deeply felt by employees. But “Don’t be evil” is mainly another way to empower employees.... Googlers do regularly check their moral compass when making decisions.

As Schmidt implies, "Don't Be Evil" has never exactly been self-explanatory or objective. In a 2003 *Wired* profile titled "[Google vs. Evil](#)," Schmidt elaborated on the motto's gnomic moral code: "Evil," he said, "is what Sergey [Brin] says is evil." Even at that early stage in the company's life, Brin recognized that the slogan was more portentous for Google itself than for other companies. Google, as gateway to the World Wide Web, was effectively establishing the infrastructure and governing framework of the Internet, granting the company unique power to benefit or harm the public interest. As the author of the *Wired* article explained, "Governments, religious bodies, businesses, and individuals are all bearing down on the company, forcing Brin to make decisions that have an effect on the entire Internet." Things that would normally be side issues for another company carry the weight of responsibility for us," Brin says.

"Don't Be Evil" is a catchy slogan. But Google's self-conception as definer and defender of the public interest is more revealing and weighty. The public focus on the slogan has distracted from the more fundamental values embodied in Google's mission statement: "to organize the world's information, making it universally accessible and useful." On its face, Google's mission is a clear, practical goal that everyone, it seems, can find laudable. It sounds value-neutral, just as its organization of information purportedly is. But one has to ask: Useful for *what*? And according to *whom*?

What a Googler Wants

There has always been more to Google's mission than merely helping people find the information they ask for. In the [2013 update of the Founders Letter](#), Page described the "search engine of my dreams," which "provides information without you even having to ask, so no more digging around in your inbox to find the tracking number for a much-needed delivery; it's already there on your screen." Or, as Page and Brin describe in the [2005 Founders Letter](#),

Our search team also works very hard on relevancy — getting you exactly what you want, even when you aren't sure what you need. For example, when Google believes you really want images, it returns them, even if you didn't ask (try a query on sunsets).

Page acknowledged in the 2013 letter that "in many ways, we're a million miles away from that perfect search engine — one that gets you just the right information at the exact moment you need it with almost no effort." In the [2007 Founders Letter](#), they explain: "To do a perfect job, you would need to understand all the world's information, and the precise meaning of every query."

To say that the perfect search engine is one that minimizes the user's effort is effectively to say that it minimizes the user's active input. Google's aim is to provide perfect results for what users truly want — even if the users themselves don't yet realize what that is. Put another way, the ultimate aspiration is not to answer a user's question but the question Google believes she *should* have asked. Schmidt himself drew this conclusion in 2010, as described in [a Wall Street Journal article for which he was interviewed](#):

The day is coming when the Google search box — and the activity known as Googling — no longer will be at the center of our online lives. Then what? We're trying to figure out what the future of search is," Mr. Schmidt acknowledges. "I mean that in a positive way. We're still happy to be in search, believe me. But one idea is that more and more searches are done on your behalf without you needing to type."

"I actually think most people don't want Google to answer their questions," he elaborates. "They want Google to tell them what they should be doing next."

Letâs say youâre walking down the street. Because of the info Google has collected about you, âwe know roughly who you are, roughly what you care about, roughly who your friends are.â Google also knows, to within a foot, where you are. Mr. Schmidt leaves it to a listener to imagine the possibilities: If you need milk and thereâs a place nearby to get milk, Google will remind you to get milk. [Emphasis added.]

Or maybe, one is tempted to add: If Google knows youâve been drinking too much milk lately, and thinks youâre the sort of person who cares about his health âand who doesnât? âit will suggest you get water instead.

As Stanfordâs Terry Winograd, Page and Brinâs former professor and a consultant on Gmail, explains to Ken Auletta, âThe idea that somebody at Google could know better than the consumer whatâs good for the consumer is not forbidden.â He describes his former studentsâ attitude as âa form of arrogance: âWe know better.â â Although the comment was about controversies surrounding Gmail advertising and privacy âuntil June 2017, Gmail [tailored its ads](#) based on the content of usersâ emails âthe attitude Winograd describes also captures well Googleâs aim to create the perfect search engine, which, in Schmidtâs words, will search âon your behalf.â

Fixing Search Results

Overshadowed by the heroic story of Googleâs triumph through objective engineering is the story of the judgments of the engineers. Their many choices âreasonable but value-laden, even value-driven âare evident throughout the accounts of the companyâs rise. And the history of Googleâs ongoing efforts to change its search results to suit various needs âof foreign governments, of itself âindicates what Google might someday do to advance a particular notion of, in Barack Obamaâs words, the âpublic good.â

As the story goes, Page and Brin designed Google to avoid human judgment in rating the relevance of web pages. Recounting Googleâs original design, Steven Levy describes the foundersâ opinion that âhaving a human being determine the ratings was out of the question,â not just because âit was inherently impractical,â but also because âhumans were unreliable. Only algorithms âwell drawn, efficiently executed, and based on sound data âcould deliver unbiased results.â

But of course the algorithms had to be well drawn *by* someone, in accord with someoneâs judgment. When the algorithms were originally created, Page and Brin themselves would judge the accuracy of search results and then tweak the code as needed to deliver better results. It was, Levy writes, âa pattern of rapid iterating and launching. If the pages for a given query were not quite in the proper order, theyâd go back to the algorithm and see what had gone wrong,â then adjust the variables. As Levy shows, it was by their own account a subjective eyeball test: âYou do the ranking initially,â Page explains, âand then you look at the list and say, âAre they in the right order?â If theyâre not, we adjust the ranking, and then youâre like, âOh this looks really good.â â

Google continues to tweak its search algorithms. In their [2008 Founders Letter](#), Page and Brin wrote, âIn the past year alone we have made 359 changes to our web search ânearly one per day.â These included âchanges in ranking based on personalizationâ âGoogle [had introduced](#) its âpersonalized searchâ feature in 2004 to tailor search results to usersâ interests. [In newer versions](#), results are tailored to usersâ search history, so that previously visited sites are more likely to be ranked higher. In 2015, Googleâs general counsel [told the Wall Street Journal](#), âWe regularly change our search algorithms and make over 500 changes a year to help our users get the information they want.â

Sometimes Google adjusts its algorithms to make them a well drawn to suit its own commercial interests. Harvard business professor Benjamin Edelman, an investigator of online consumer fraud and privacy violations, [published findings in 2010](#) indicating that Google a hard-coded its search algorithms, responding to queries for certain keywords by prioritizing its own web sites, such as Google Health and Google Finance. And in 2012 the Federal Trade Commission's Bureau of Competition [compiled a report](#) detailing Google's pattern of prioritizing some of its own commercial web pages over those of its competitors in search results.

Edelman's and the FTC's conclusions seem well founded, but even more striking are the 2007 words of Google's own Marissa Mayer, then one of its senior executives. In a public talk, she was asked why searches for stock tickers had begun to list Google Finance's page as the top result, instead of the Yahoo! Finance web site that had previously dominated. Mayer (who, ironically, would later leave Google to become CEO of Yahoo!) told the audience bluntly that Google *did* arrange to put Google Finance atop search listings, and that it was also company a policy to do likewise for Google Maps and other sites. [She quipped](#), a It seems only fair, right? We do all the work for the search page and all these other things, so we do put it first.

Censorship and the Public Good

Some of the changes Google has made to its search results have been for apparently political reasons. In 2002, Benjamin Edelman and Jonathan Zittrain (also of Harvard) [showed that](#) Google had quietly deleted from the French and German search engines 113 pro-Nazi, anti-Semitic, white supremacist, or otherwise objectionable web sites a some of them a difficult to cleanly categorize. Although the authors found a no mention of government-mandated (or -requested) removals, a it seemed clear that these were pages a with content that might be sensitive or illegal in the respective countries.

Google also has accommodated governmental demands for much less laudable reasons. In 2006, Google attracted strong criticism for [censoring its search results](#) at Google.cn to suit the Chinese government's restrictions on free speech and access to information. As the [New York Times reported](#), for Google's Chinese search engine, a the company had agreed to purge its search results of any Web sites disapproved of by the Chinese government, including Web sites promoting Falun Gong, a government-banned spiritual movement; sites promoting free speech in China; or any mention of the 1989 Tiananmen Square massacre.

Google's entry into China under these conditions spurred significant debate within the company. Would bowing to an authoritarian regime's demands to limit freedom empower the regime, harming Google's mission? Or would continuing to make the search engine available a even under the restrictions imposed by the government a ultimately empower the Chinese people?

Andrew McLaughlin, then Google's director of global public policy, urged his colleagues against partnering with the Chinese government because of how it would change Google. Steven Levy recounts McLaughlin's reasoning: a My basic argument involved the day-to-day moral degradation, just dealing with bad people who are badly motivated and force you into a position of cooperation. a But Page was hopeful, and so, as Levy tells the story, a the Google executives came to a decision using a form of moral metrics a that is, they tallied the evil of banning content against the good Google might bring to China. Schmidt later said, a We actually did an a evil scale a and decided [that] not to serve at all was worse evil.

After several difficult years in China, cold reality confirmed McLaughlin's skepticism. In 2010, [Google announced](#) that it had discovered an a attack on our corporate infrastructure originating from China a and that a main target was the Gmail accounts of Chinese human rights activists. Google had had enough of its

approach to China, announcing it would only continue operating its search engine in the country if it could come to an agreement with the government on how to do so without censorship. Without any formal declaration as such, the negotiations eventually failed. Google stopped censoring, but the Chinese government threatened action and gradually cracked down, with [reports indicating](#) that Google search has been [blocked in mainland China since 2014](#), along with many other Google services.

Google's awkward moral dance with China offers a case study in what happens when its two core missions — providing objective searches of all the world's information and Not Being Evil — come into conflict. It suggests an important and paradoxical lesson: Google is willing to compromise the neutrality of its search results, and itself, for the sake of what it deems the broader public good, a goal that is plainly morally driven to begin with.

The question raised by the example of China, and in a limited but perhaps clearer way by France and Germany, is: What are the possibilities when Google is cooperating with a government with which it is less adversarial, and whose conception of the public good it more closely shares?

Google's Change Obama Could Believe In

Barack Obama first visited Google's headquarters during a fundraising trip in California in 2004, around the time he burst onto the national stage with his riveting address to the Democratic National Convention. The visit made such an impression on Obama that he described it at length two years later in his book [The Audacity of Hope](#). He recounts touring the Google campus and meeting Larry Page: "We spoke about Google's mission — to organize all of the world's information into a universally accessible, unfiltered, and usable form." But Obama was particularly moved by "a three-dimensional image of the earth rotated on a large flat-panel monitor," on which colored lights showed the ceaseless flurry of Google searches across the globe, from Cambridge to rural India. "Then I noticed the broad swaths of darkness as the globe spun on its axis — most of Africa, chunks of South Asia, even some portions of the United States, where the thick cords of light dissolved into a few discrete strands."

Obama's reverie, as he put it, was broken by the arrival of Sergey Brin, who brought him to see Google's weekly casual get-together where employees could meet and discuss issues with him and Page. Afterward, Obama discussed with Google executive David Drummond the need for America to welcome immigrants and foreign visitors, lest other nations leapfrog us as the world's leader in technological innovation. "I just hope somebody in Washington understands how competitive things have become," Obama recalls Drummond telling him. "Our dominance isn't inevitable."

Obama returned to Google in November 2007, choosing it as the forum to announce his nascent presidential campaign's [Innovation Agenda](#), a broad portfolio of policies on net neutrality, patent reform, immigration, broadband Internet infrastructure, and governmental transparency, among other topics. His [remarks](#) reveal his deepening affinity for Google and its founders. Recounting the company's beginnings in a college dorm room, he cast its vision as closely aligned with his own for America: "What we shared is a belief in changing the world from the bottom up, not the top down; that a bunch of ordinary people can do extraordinary things." With words that would become familiar for describing Obama's outlook, he said that "the Google story is more than just being about the bottom line. It's about seeing what we can accomplish when we believe in things that are unseen, when we take the measure of our changing times and we take action to shape them."

After Obama's opening remarks, CEO Eric Schmidt — who would later [endorse Obama and campaign for him](#) — joined him on stage to lead a long and wide-ranging Q&A. While much of the discussion focused on predictable subjects, in the closing minutes Obama addressed a less obvious issue: the need to use technology and information to break through people's ill-founded opinions. He said that as president he

wouldn't allow special interests to dominate public discourse, for instance in debates about health care reform, because his administration would reply with data and facts. He added, jokingly, that if they start running Harry and Louise ads, I'll run my own ads, or I'll send out something on YouTube. I'm president and I'll be able to I'll let them know what the facts are.

But then, joking aside, [he focused squarely](#) on the need for government to use technology to correct what he saw as a well-meaning but too often ignorant public:

You know, one of the things that you learn when you're traveling and running for president is, the American people at their core are a decent people. There's a generosity of spirit there, and there's common sense there, but it's not tapped. And mainly people they're just misinformed, or they are too busy, they're trying to get their kids to school, they're working, they just don't have enough information, or they're not professionals at sorting out all the information that's out there, and so our political process gets skewed. But if you give them good information, their instincts are good and they will make good decisions. And the president has the bully pulpit to give them good information.

And that's what we have to return to: a government where the American people trust the information they're getting. And I'm really looking forward to doing that, because I am a big believer in reason and facts and evidence and science and feedback everything that allows *you* to do what you do, that's what we should be doing in our government. [*Crowd applauds.*]

I want people in technology, I want innovators and engineers and scientists like yourselves, I want you helping us make policy based on facts! Based on reason!

The moment is captured perfectly in Steven Levy's book [In the Plex](#), where he writes of Obama: *He thought like a Googler.*

Obama then invoked the famous apocryphal line of Senator Daniel Patrick Moynihan: You are entitled to your own opinion, but you're not entitled to your own facts. Obama finished his speech by pointing to the crucial role that Google could play in a politics based on facts:

And part of the problem that we're having ... is, we constantly have a contest where facts don't matter, and I want to restore that sense of decisions being based on facts to the White House. And I think that many of you can help me, so I want you to be involved.

Obama's appeal to the Googlers proved effective. Not only did Eric Schmidt personally campaign for Obama in 2008, but Google tools proved instrumental to his 2012 reelection campaign machine, years before the Trump campaign used tech platforms to similar effect in 2016. According to a [2013 Bloombergreport](#), Google's data tools helped the Obama campaign cut their media budget costs by tens of millions of dollars through effective targeting. Schmidt helped make hiring and technology decisions for Obama's analytics team, and after the election he hired the core team members as the staff of Civis Analytics, a new consulting firm for which Schmidt was the sole investor. The staff of Google Analytics, the company's web traffic analytics product, [cited the 2012 campaign's use of their platform](#) as a case study for its effectiveness at targeting and responding to voters. In words reminiscent of Obama's odes to making policy based on reason and facts, the report claims that Google Analytics helped the reelection campaign support a culture of analysis, testing and optimization.

And Google's relationship with Obama didn't stop with the campaigns. In the years after his election, scores of Google alums would join the Obama administration. Among the most prominent were Megan Smith, a Google vice president, who became Obama's Chief Technology Officer, and her deputy Andrew

McLaughlin, who had been Google's director of global public policy. Eric Schmidt joined the Council of Advisors on Science and Technology. In October 2014, the [Washington Post recounted](#) the migration of talent from Google to the Obama White House under the headline, "With appointment after appointment, Google's ideas are taking hold in D.C."

But the professional kinship between Google and the administration only saw comprehensive attention in its closing. In April 2016, *The Intercept* published a [The Android Administration](#), an impressive report laying out in great detail a case that no other public company approaches this degree of intimacy with government. It included charts that visualized the 252 job moves between Google and government from Obama's campaign years to early 2016, and the 427 meetings between White House and Google employees from 2009 to 2015 more than once a week on average. The actual number of meetings is likely even higher, since, according to reports of the [New York Times](#) and [Politico](#), White House officials frequently conducted meetings outside the grounds in order to skirt disclosure requirements. As *The Intercept* aptly observed, "the Obama administration attempting to project a brand of innovative, post-partisan problem-solving of issues that have bedeviled government for decades has welcomed and even come to depend upon its association with one of America's largest tech companies."

Obama Change Google Could Believe In

The relationship seemed to bear real fruit, as the Obama White House produced a number of major policies that Google had advocated for. The most prominent of these was a [net neutrality](#), which proved to be one of the Obama administration's top policy goals. The term refers to policies requiring broadband Internet providers to be "neutral" in transmitting information to customers, meaning that they are not allowed to prioritize certain kinds of traffic or to charge users accordingly. As I've previously described it in [an online article for this journal](#), net neutrality would prohibit networks from selling faster, more reliable service to preferred websites or applications while concomitantly degrading the service for disfavored sites and applications such as peer-to-peer services for swapping bootleg music and video files.

The Obama administration's Federal Communications Commission (FCC) attempted twice to implement net-neutrality regulations, both times (in [2010](#) and [early 2014](#)) being rejected by the U.S. Court of Appeals for the D.C. Circuit. Finally, in November 2014, [President Obama exhorted](#) his FCC to impose a strict regulatory framework typically used for common carriers. That is, the move sought to regulate broadband Internet companies with the same kind of framework long ago applied to railroads and traditional telephone companies. Providers are required to share their public networks and are prohibited from discriminating against any uses of it, as long as those uses are lawful. The FCC [adopted Obama's expansive approach](#) in 2015 in a set of regulations that it called the [Open Internet Order](#).

Google was originally ambivalent toward net neutrality, signing on to a [policy proposal](#) that might allow for some forms of traffic prioritization. But by 2014, Google came to fully endorse net neutrality. It joined other tech companies in a [letter to the FCC](#) warning that regulations allowing Internet providers to discriminate or offer paid prioritization would constitute a "grave threat to the Internet," and it launched a public campaign on its [Take Action](#) website. The FCC [returned to the issue in December 2017](#), with its new Trump-appointed chairman, Ajit Pai, leading the way toward repealing the Obama FCC's rule. Google [maintains a web page](#) to rally support behind the Obama-era regulation, and the issue remains unresolved as of this writing.

Google enjoyed other policy successes with the Obama-era FCC. [At least as early as 2007](#), Google had urged the FCC to exempt part of the radio spectrum from the longstanding, time-consuming process to obtain a non-marketable license for its usage. Instead, Google proposed treating it as an open market, in which the right to use portions of the spectrum could be easily bought and sold between companies. Google anticipated

that the move could encourage competition among service providers, increasing consumer availability of mobile wireless access to the Internet and to Google's services. In 2014, as the Obama FCC began to propose a plan to reform its spectrum management, [Google urged the FCC](#) to dedicate the equivalent of four television channels for unlicensed uses. When the FCC [adopted](#) a plan that reallocated spectrum for such uses, Google [posted a note on its public policy blog](#) celebrating the FCC's important step toward powering tomorrow's wireless broadband.

In another example, in January 2016 the FCC [proposed rules](#) requiring cable TV providers to unlock their set-top boxes. Most consumers currently have to rent their set-top boxes from cable companies, so the move would allow competitors to offer devices at cheaper rates. It would also have permitted Google and other companies to access and repackage the cable channels as they saw fit. In theory, you could buy a single device through which you could watch Netflix, YouTube, HBO, and C-SPAN, all on your TV and without having to switch sources. The FCC proposal framed the move as aimed at creating choice & innovation. For Google, it would also have opened a new front in the nascent bid to compete directly against TV and Internet providers already underway with Chromecast, its device for playing streaming Internet video on a TV, and Google Fiber, its ultra-fast Internet access service.

Two days after the FCC announced its proposal, Google hosted an event in its Washington, D.C. office near Capitol Hill to demonstrate its own prototype for a TV box, for a very specific audience: It wasn't an ordinary Google product event, [CNN reported](#). There were no skydiving executives. No throngs of app developers. No tech press. Instead, The audience consisted of congressional staffers and federal regulators. The proposal [has since been canceled](#) by President Trump's FCC chairman.

The signs of a Google-government policy alignment during the Obama administration were not limited to the FCC. The landmark intellectual property reforms that Obama signed into law as the America Invents Act of 2011 found enthusiastic support from Google, [which had joined](#) with a number of other big tech companies to form the Coalition for Patent Fairness, which [lobbied for the bill](#). Google's main interest was in fighting so-called patent trolls—agents who obtain intellectual property rights not to create new products but to profit from infringement lawsuits. Companies like Google, which use and produce a vast array of individual technologies, are naturally vulnerable to such lawsuits. In [comments submitted](#) to the Patent and Trademark Office shortly after the bill's enactment, Google (together with a few other tech companies) urged the PTO to adopt rules to reduce the costs and burdens of patent-related litigation. Their stated aim was to advance Congress's ultimate goal of increasing patent quality by focusing the time and resources of America's patent community on productive innovation and strengthening the national economy.

In February 2013, Obama returned to the subject of intellectual property during a [Fireside Hangout](#), an online conversation with Americans arranged and moderated by Google, using its platform for video chat. Echoing Google's position, Obama argued for still more legislation to further limit litigation by patent holders who don't actually produce anything themselves and are trying to essentially leverage and hijack somebody else's idea and see if they can extort some money out of them. The following year, [Obama appointed](#) Google's former deputy general counsel and head of patents and patent strategy, Michelle K. Lee, to serve as director of the PTO.

Why did the Obama administration side so reliably with Google? Some might credit it simply to the blunt force of lobbying. In 2012, Google was [the nation's second-largest corporate spender on lobbying](#), behind General Electric; by 2017 [it had taken the lead](#), spending \$18 million. That money and effort surely had some effect, as did the hundreds of meetings between Google employees and the White House. Responding to a 2015 [Wall Street Journal article](#) on Google's friendly relationship with the Obama administration, [Google stated](#) that their meetings covered a very broad range of subjects: patent reform, STEM education, self-driving cars, mental health, advertising, Internet censorship, smart contact lenses, civic innovation, R&D, cloud computing, trade and investment, cyber security, energy efficiency and our workplace benefit policies.

But there are some things even money can't buy. Conjectures about the effectiveness of Google's lobbying and its persistent visits miss that the Obama administration's affinity for Google ultimately rested on more fundamental principles—principles held not by Obama alone, but by modern progressives generally.

â A Common Baselineâ

Recounting Barack Obama's 2007 visit to Google, Steven Levy observes that â Google was Obama Territory, and vice versa. With its focus on speed, scale, and above all data, Google had identified and exploited the key ingredients for thinking and thriving in the Internet era. Barack Obama seemed to have integrated those concepts in his own approach to problem solving.â Later Levy adds, â Google and Obama vibrated at the same frequency.â

It is not hard to see the similarities in Google's and Obama's social outlooks and self-conceptions. There is not a great distance between Google's â Don't Be Evilâ and Obama's â Don't Do Stupid Sh**â—the glib slogan [he reportedly started using](#) in his second term to describe his foreign policy views. Nor does a vast gulf separate Google's increasingly confident goal of answering questions you haven't asked and Obama's 2007 sketch of the American people as full of untapped common sense yet often ignorant, so that what they need is a president to give them the facts from the bully pulpit. The common theme is that we make wrong decisions not because the world is inherently complex but because most people are self-interested and dumb â except for the self-anointed enlighteners, that is.

For years, American progressives have offered paeans to â facts,â â evidence,â and â science,â and bemoaned that their opponents are at odds with the same. The [2008 platform of the Democratic Party](#), for example, vowed to â end the Bush Administration's war on science, restore scientific integrity, and return to evidence-based decision-making.â As we've seen, Obama had already embraced that critique during his presidential campaign. â I'll let them know what the facts are,â he told his Google audience in 2007, sure of his ability to discern the objective truths his ideological opponents missed or ignored or concealed. At the time, he saw Google as a partner in that endeavor.

But over a decade later, at the M.I.T. conference this February, Obama presented a less optimistic view of the major tech companies' effect on national debates. (The event was off the record, but *Reason* magazine obtained and [posted an audio recording](#).) He noted his belief that informational tools such as social media are a â hugely powerful potential force for good.â But, he added, they are merely tools, and so can also be used for evil. Tech companies such as Google â are shaping our culture in powerful ways. And the most powerful way in which that culture is being shaped right now is the balkanization of our public conversation.â

Rather than uniting the nation around a common understanding of the facts, Obama saw that Google and other companies were contributing to the nation's fragmentation â a process that goes back to TV and talk radio but â has accelerated with the Internetâ :

... essentially we now have entirely different realities that are being created, with not just different opinions but now different *facts* â different sources, different people who are considered authoritative. It's â since we're at M.I.T., to throw out a big word â it's *epistemological*. It's a baseline issue.

As in his 2007 talk at Google, Obama then offered the same (ironically apocryphal) anecdote about Senator Daniel Patrick Moynihan winning a heated debate with the line, â You are entitled to your own opinion, but you're not entitled to your own facts.â The radical difference in information presented between sources, such as Fox News and the *New York Times* editorial page, Obama explained, means that â they do not

describe the same thing.â Google and social media, he seemed to imply, facilitate the creation of alternate realities, as poor information can be spread just as easily and can look just as authoritative as good information, and â it is very difficult to figure out how democracy works over the long term in those circumstances.â

Calling for â a common baseline of facts and information,â Obama urged that we need to have â a serious conversation about what are the business models, the algorithms, the mechanisms whereby we can create more of a common conversation.â Although he greatly admires Google and some of the other tech companies, he explained, we need some â basic rules,â just as we need them in a well-functioning economy. This shift must be oriented around an understanding that tech companies are â a public good as well as a commercial enterprise.â

Taken together, it was a significant change in tone from Obamaâs 2007 talk at Google â as well as from his [2011 State of the Union Address](#), in which he called America a â nation of ... Google and Facebook,â and meant it in the best possible way, as an example of American ingenuity. In 2018, after his presidency, he still saw America as a nation of Google and Facebook â but in a much more ominous way.

Meanwhile, and perhaps unbeknownst to Obama, Google already seems to be moving in the direction he indicated, self-imposing some basic rules to help ensure public debates are bound by a common baseline of facts.

â Evil Contentâ

Googleâs founders have always maintained the conceit that Googleâs ranking of information is fundamentally objective, determined by what is, or should be, most *useful* to users. But in recent years â particularly in the last two, as concern has grown from many quarters over the rise of â fake newsâ â Google has begun to tailor its search to prioritize content that it sees as more *credible*.

In April 2017, Google [announced](#) the worldwide release of its â Fact Checkâ feature for search results: â For the first time, when you conduct a search on Google that returns an authoritative result containing fact checks for one or more public claims, you will see that information clearly on the search results page.â A box will clearly display the claim and who stated it, together with who checked it and, ostensibly, whether it is true. The announcement explained that Google is not itself doing the fact-checking, and that instead it relies on â publishers that are algorithmically determined to be an authoritative source of information.â And while different publishers may sometimes come to different conclusions, â we think itâs still helpful for people to understand the degree of consensus around a particular claim and have clear information on which sources agree.â Google tied this new program directly to its fundamental mission: â Google was built to help people find useful information,â the release explained, and â high quality informationâ is what people want.

Only a few weeks later, Google [announced](#) that it would be taking much more direct steps toward the presentation of factual claims. In response to the problem of â fake newsâ â the spread of blatantly misleading, low quality, offensive or downright false informationâ â Google has adjusted its search algorithms to down-rank â offensive or clearly misleading content, which is not what people are looking for,â and in turn to â surface more authoritative content.â In Google-speak, to â surfaceâ is to raise items higher in search results.

Then, in November 2017, Google [announced](#) that it would further supplement its Fact Check approach with another labeling effort known as the â Trust Project.â Funded by Google, hosted by Santa Clara University, and developed in conjunction with more than 75 news organizations worldwide, the Trust Project includes eight â trust indicators,â such as â author expertise,â â citations and references,â and

â diverse voices.â News publishers would be able to provide these indicators for their online content, so that Google could store and present this information to users in Google News and other products, much like how articles in Google News now display their publication name and date.

Two days later, Eric Schmidt â by then the Executive Chairman of Alphabet, Googleâs new parent company â appeared at the Halifax International Security Forum and engaged in a [wide-ranging Q&A](#) about the geopolitical scene. Explaining the steps that Google and its sister companies, such as YouTube, were taking to combat Russian â troll farms,â terrorist propaganda, and other forms of fake news and abuse, Schmidt [eventually turned](#) to a broader point about Googleâs role in vetting the factual â or moral â quality of search results.

We started with a position that â the American general view â that bad speech will be replaced by good speech in a crowded network. And the problem in the last year is that that may not be true in certain situations, especially when you have a well-funded opponent thatâs trying to actively spread this information. So I think everybody is sort of grappling with where is that line.

Schmidt continued, offering a â typical exampleâ : When â a judge or a leader, typically in a foreign country,â complains that illegal information appeared in Google search results, Google will respond that, within a minute and a half, they had noticed it themselves and taken it down. Using their crowdsourcing model, that time frame, Schmidt explains, is difficult to beat. But he goes on: â Weâre working hard to use machine learning and AI to spot these things ahead of time ... so that the publishing time of evil content is exactly zero.â

So what about Googleâs role in the United States? Where would it find the line? At one point, an audience member, Columbia professor Alexis Wichowski, [raised a question](#) along the same lines that Obama would at M.I.T. a few months later â about the â lack of common narrative.â â We talk about echo chambers as if theyâre some sort of inevitable consequence of technology, but really theyâre a consequence of how good the algorithms are at filtering information out that we donât want to see. So do you think that Google has any sort of role to play in countering the echo chamber phenomenon?â Schmidt responded that the problem was primarily one of social networks, not of Googleâs search engine. But, he added, Google does have an important role to play:

I am *strongly* not in favor of censorship. I am *very* strongly in favor of *ranking*. Itâs what we do. So you can imagine an answer to your question would be that you would de-rank â that is, lower-rank â information that was repetitive, exploitive, false, likely to have been weaponized, and so forth.

Were Schmidt referring only to the most manifestly false or harmful content, then his answer would have been notable but not surprising; after all, Google had long ago begun scrubbing racist and certain other offensive web pages from its search results in France and Germany. But the suggestion that Google might de-rank information that it deems false or exploitative more generally raises much different possibilities. Such an approach â employed, for example, in service of Obamaâs call to bring Americans together around common facts relevant to policy â would have immense ramifications.

Payday

We see a glimpse and a possible portent of Googleâs involvement in public policy in its fight against the payday loan industry. A type of small, high-interest loan usually borrowed as an advance on a consumerâs next paycheck, payday loans are typically used by low-income people who are unable to get conventional loans, and have been widely decried as predatory.

Google's targeting of payday loans arguably began within their objective wheelhouse. In 2013, Google [started tailoring](#) its search algorithms to de-rank sites that use spamming tactics, such as bot queries, to artificially increase their rankings. Matt Cutts, then the head of Google's web spam team, [mentioned payday-loan and pornography sites](#) as two chief targets. The editors of the news site Search Engine Land dubbed [the new anti-spam code](#) the "Payday Loan Algorithm." (One editor [attributes the name to Danny Sullivan](#), then also an editor of the site, who has since become Google's public liaison of search.) At least as Google described it, these measures were simply aimed at countering exploitations of its ranking algorithm.

Yet even at this stage, there were indications that combating spam may not have been Google's sole rationale. When someone [tweeted at Cutts a criticism of the change](#) "Great job on payday loans in UK. Can't find a provider now, but plenty of news stories. Way to answer users queries" Cutts did not reply with a defense of combating spam tactics. Instead, he replied with a link to a [news article](#) about how the U.K. Office of Fair Trading was investigating payday lenders for anticompetitive practices and "evidence of financial loss and personal distress to many people." "Seems like pretty important news to me?", [Cutts added](#). "OFT is investigating entire payday loan space?" Cutts's reply was suggestive in two ways. One was a reminder that qualitative judgments about relevance have always been part of Google's rationalizations for its search rankings. The other was the suggestion that top leadership at Google was well aware of the concerns that payday loans are predatory, and perhaps even saw it as desirable that information about the controversy be presented to users searching for payday lenders.

A clearer shift arrived in May 2016, when Google [announced](#) that it would start "banning ads for payday loans and some related products from our ads systems." Although there was no mention of this change affecting search rankings, it was a more aggressive move than the de-ranking of spammers, as the rationale for it this time was explicitly political: "research has shown that these loans can result in unaffordable payment and high default rates for users." The announcement quoted the endorsement of Wade Henderson, president and CEO of The Leadership Conference on Civil and Human Rights: "This new policy addresses many of the longstanding concerns shared by the entire civil rights community about predatory payday lending." (It should be noted that it is not clear that Google's move has been entirely effective. Five months after the announcement, a [report in the Washington Examiner](#) found that ads for intermediary "lead-generation companies that route potential borrowers to lenders" were still displaying.)

Unlike Google's decision to combat spam associated with payday loans, there is no universal agreement about whether the loans themselves are exploitative or harmful. For example, a [2017 article](#) in the *Quarterly Review of Economics and Finance* found that "payday loans may cause little harm while providing benefits, albeit small ones, to some consumers" and counseled "further study and caution." [An episode of the popular Freakonomics podcast](#) gives reason to believe that the seemingly predatory practices of payday lenders owe in some significant measure to the nature of the service itself "providing quick, small amounts of credit to people vulnerable to sudden, minor financial shocks. It tells the story of a twenty-year-old Chicago man for whom a payday loan meant he could pay off a ticket for smoking, presumably avoiding even greater penalties for nonpayment. If this picture of payday loans is hardly rosy, it is not simple either. More to the point, there is no purely apolitical judgment of payday loans to be had. Google made the decision to ban payday-loan ads based not on a concern about legitimate search practices but on its judgment of sound public policy.

The timing of Google's decision on this issue also came at a politically opportune moment, suggesting a fortuitous convergence in the outlooks of Google and the Obama administration. In March 2015, President Obama [announced](#) his administration's opposition to payday loans, in a speech that coincided with the Consumer Financial Protection Bureau's [announcement](#) that it would formulate rules restricting such loans. The administration [continued its campaign](#) against payday loans through 2016, culminating with the CFPB's [formal release of proposed regulations](#) in June. This was only a few weeks after Google announced its ban on payday-loan ads. And this May, Google, joined by Facebook, [announced a similar ban](#) on ads for bail-bond services "bail reform has recently become a popular cause among libertarians and

progressives.

These kinds of political efforts may be a departure from Google's founding principle of neutrality but they are a clear extension of its principle of usefulness. Again, Google's mission to organize the world's information, making it universally accessible and useful is rife with value judgments about what information qualifies as useful.

It is not much of a further stretch to imagine that Google might decide that not only payday lenders themselves but certain information favorable to payday lenders is no longer useful to consumers either. If research has shown that payday loans are harmful or predatory, it is not difficult to imagine that contrary information in industry literature, research by people with ties to the industry, even simply articles that present favorable arguments might fall under what Eric Schmidt deems exploitive, false, likely to have been weaponized, and be de-ranked.

And how much further, then, to other subjects? If it is widely believed that certain policy stances, especially bearing on science say, on energy or climate policy or abortion are simply dictated by available factual evidence, then arguments or evidence to the contrary could likewise be deemed a kind of exploitative informational fraud, hardly what any user really intends to find. Under the growing progressive view of political disagreement, it is not difficult to see the rationale for de-ranking many other troublesome sources.

A Level Playing Field

Another striking recent example still unfolding as this article went to publication illustrates the shaky ground on which Google now finds itself, the pressures to which it is vulnerable, and the new kinds of actions it might be willing to take in response.

On May 4, responding to ongoing concerns over how it and other tech companies were [used by Russian agents](#) to influence the 2016 U.S. elections, Google [announced](#) new policies to support election integrity through greater advertising transparency, including a requirement that people placing ads related to U.S. elections provide documentation of U.S. citizenship or lawful residency. This announcement came amid debate over Ireland's referendum to repeal its constitutional limits on abortion. Just five days later, [Google decided](#) to pause all ads related to the referendum, including ads on YouTube.

As a rationale, Google cited only its recent election-integrity effort, and did not offer further explanation. Its decision came a day after a [similar decision by Facebook](#) to restrict referendum ads only to advertisers residing in Ireland, citing unspecified concerns that foreign actors had been attempting to influence the vote by buying Facebook ads. [Multiple Irish Times](#) articles cited Gavin Sheridan, an Irish entrepreneur who, starting ten days before Google's decision, wrote a widely read [series of tweets](#) offering evidence that anti-repeal ads were being bought by pro-life groups in the United States.

Though Google's and Facebook's pause on ads applied to both sides of the campaign, it was not perceived by Irish activists as having equal impact. In fact, the response of both sides suggests a shared belief that the net effect of the restriction would favor the repeal campaign. [A report in the Irish Times](#) quotes campaigners on both sides who saw it as a boon for repeal a spokesperson for the repeal campaign praised the restriction as a move that creates a level playing field, while [anti-repeal groups claimed it was motivated by concern that repeal would fail](#). As an article in *The Irish Catholic* described it, the pro-life activists argued that mainstream media is dominated by voices who favour the legalisation of abortion in Ireland, and online media had provided them with the only platform available to them to speak to voters directly on a large scale. (The referendum vote had not yet been held when this article went to publication.)

Google and Facebook alike have cited concerns over foreign influence on elections that sound reasonable, and are shared by many. But *Irish Times* reporter Pat Leahy, who said that Google declined to respond to questions about its rationale, [also cited sources](#) familiar with the companiesâ thinking who said that they â became fearful in the past week that if the referendum was defeated, they would be the subject of an avalanche of blame and further scrutiny of their role in election campaigns.â

With this action, Google has placed itself in a perilous situation. A decision to prevent foreign actors from advertising in a countryâ s elections has clear merit, but it also requires unavoidably political reasoning. Moreover, although the action is on its face neutral, as it bars advertising from both sides of the campaign, the decision to *apply* the rationale to this particular case is also plainly subjective and political. Notice that, as justification for banning referendum ads in Ireland, Google cited only an earlier policy announcement that applied just to the United States. And whereas that policy had banned only foreign advertisers, in Ireland Google banned referendum ads from *everyone*, even Irish citizens and residents. Google did not offer rationales for either expansion, or explain whether the practices would apply to other countries going forward. From now on, Googleâ s decision to invoke one rationale in one case and another rationale in another will inevitably appear ad hoc and capricious.

Whatever its real motives, Google â which surely knew full well that its action would benefit the repeal campaign â has left itself incapable of credibly rebutting the charge that politics entered into its decision. And if political considerations are legitimate reasons for Google in these particular cases, then all other cases will become open to political pressure from activists too. Indeed, failure to act in other cases, invoking the old â digital Switzerlandâ standard of nonintervention, will now risk being seen as no less capricious and political.

From Antitrust to Woke Capital

All around, there is a growing unease at Googleâ s power and influence, and a rising belief from many quarters that the answer is antitrust action. It certainly seems like the sort of company that might require breaking up or regulating. As noted earlier, the *Wall Street Journal* recently [found](#) that Googleâ s market share of all Internet searches is 89 percent, while it scoops up 42 percent of all Internet advertising revenue.

Some might draw solace from the fact that users can switch to a different search engine anytime. â We do not trap our users,â [Eric Schmidt told a Senate subcommittee in 2011](#). â If you do not like the answer that Google search provides you can switch to another engine with literally one click, and we have lots of evidence that people do this.â That Google search has competition is true enough, but only up to a point, because Google enjoys an immense and perhaps insurmountable advantage over aspiring rivals. Having accumulated nearly twenty years of data, its algorithms draw from a data set so comprehensive that no upstart search engine could ever begin to imitate it. Schmidt himself recognized this in 2003, when he [told the *New York Times*](#) that the sheer size of Googleâ s resources created an uncrossable moat: â Managing search at our scale is a very serious barrier to entry.â And that was just a few years into Googleâ s life; the barrier to entry has grown vastly wider since.

It is not hard to imagine the federal government bringing antitrust action against Google someday, as it did in 1974 against AT&T and in 2001 against Microsoft. Congress has taken an interest in Googleâ s practices: In 2011, the Senateâ s antitrust subcommittee convened a hearing titled â [The Power of Google: Serving Consumers or Threatening Competition?](#)â And in 2012, staffers of the Federal Trade Commission completed a long and detailed report analyzing Googleâ s practices, half of which was later [obtained and published by the *Wall Street Journal*](#).

The report found a variety of anticompetitive practices by Google, including illegally copying reviews from Amazon and other websites to its own shopping listings; threatening to remove these websites from

Google's search results when they asked Google not to copy their content; and disfavoring competitors in its search results. The report [recommended an antitrust lawsuit](#) against Google, citing monopolistic behavior that "will have lasting negative effects on consumer welfare." But the commission rejected the recommendation of its staff, [deciding unanimously](#) to close the investigation without bringing legal action. Instead, it reached a settlement with Google in which the company [agreed to change](#) some of its practices. The European Union, however, has not been so hesitant, [levying a \\$2.7 billion fine against Google](#) in 2017 for similar practices.

But while progressive critics of Google seem to focus exclusively on either regulation or breakup as the natural remedies for its seeming monopoly, they forget the third possibility: that government might actually draw *closer* to business, collaborating toward a shared vision of the public interest. Collaboration between government and industry giants would not be a departure from progressivism; quite the contrary, there is some precedent in New Deal economic policy, as recounted by E. W. Hawley in [The New Deal and the Problem of Monopoly](#) (1966). FDR-era proponents of the "business commonwealth" approach believed that certain business leaders "had taken and would take a paternalistic and fair-minded interest in the welfare of their workers," had moreover "played a major role in the creation of American society," and that therefore they "were responsible for its continued well-being." Accordingly, the argument went, "they should be given a free hand to organize the system in the most efficient, rational, and productive manner." Government would retain a "supervisory role," but this would not be an onerous task so long as an industry's interests were generally seen to be "identical with those of society as a whole."

While this approach, unsurprisingly, was first advanced by the business community, it became a core component of the first New Deal's crown jewel, the National Industrial Recovery Act of 1933, which empowered industry groups to write their own "codes of fair competition" in the public interest, under the president's oversight. The law was declared unconstitutional by the Supreme Court two years later. But until then its cooperative provisions embodied, in Hawley's words, "the vision of a business commonwealth, of a rational, cartelized business order." By coupling those provisions with the more familiar progressive policies of antitrust and regulation, the NIRA, "as written ... could be used to move in any of these directions," thus embodying progressivism's ambivalence as to whether it is better to beat Big Business or join it.

One should not draw too close a connection between policy then and now. But Hawley's description bears a striking resemblance to modern progressive visions of what Google is and perhaps ought to become. Although progressives have traditionally been deeply suspicious of corporate power in our government and in our society, and corporations in turn have traditionally shown little interest in convincing progressives otherwise, that trend may be changing, as *New York Times* columnist Ross Douthat [suggested](#) in February. Citing recent corporate advocacy on behalf of gun control, immigration, and gay and transgender rights, Douthat observed that "the country's biggest companies are [growing a conscience](#), prodded along by shifts in public opinion and Donald Trump's depredations and their own idealistic young employees, and becoming a vanguard force for social change." The usual profit motives have not been displaced, of course, but some major corporations seem increasingly interested in obligations of social conscience. It is, to quote the column's headline, "the rise of woke capital."

In important senses, Google has defined itself from the start as ahead of the woke curve. "We have always wanted Google to be a company that is deserving of great love," said Larry Page [in 2012](#). In establishing Google as a company defined by its values as much as its technology, Page and Sergey Brin have long made clear their desire to see Google become a force for good in the world. In 2012, Page reaffirmed that vision in an interview with [Fortune magazine](#), describing his plan to "really scale our ambition such that we are able to cause more positive change in the world and more technological change. I have a deep feeling that we are not even close to where we should be."

As Google's sense of public obligation grows, and as progressive government becomes ever more keen on

technology as a central instrument of its aims and more aware of tech companies' power to shape public debates, it is not difficult to see how Google's role could expand. At the very least, Google's ability to structure the information presented to its users makes it a supremely potent "nudger." As Richard Thaler and Cass Sunstein argue in their 2008 book [Nudge](#), how information is presented is a central aspect of "choice architecture." As they put it,

public-spirited choice architects — those who run the daily newspaper, for example — know that it's good to nudge people in directions that they might not have specifically chosen in advance. Structuring choice sometimes means helping people to learn, so they can later make better choices on their own.

If the "public-spirited" publisher of a daily newspaper can have such an effect on a community, just imagine the impact Google might have nationwide, even worldwide.

This, of course, would be a scenario well beyond merely nudging. As the *de facto* gateway to the Internet, Google's power to surface or sink web sites is effectively a power to edit how the Internet appears to users — a power to edit the world's information itself. This is why a decision by Google to "de-index" a web page, striking it from its search results altogether (usually for a serious violation of guidelines) is [commonly called](#) Google's "death penalty." In a sense, Google exercises significant power to regulate its users in lieu of government. As Harvard law professor Lawrence Lessig argued in his seminal 1999 book [Code](#):

While of course code is private, and of course different from the U.S. Code, its differences don't mean there are not similarities as well. East Coast Code — law — regulates by enabling and limiting the options that individuals have, to the end of persuading them to behave in a certain way. West Coast Code — does the same.

Whether we think of Google as acting in lieu of government or in league with government — either Lessig's codemaker-as-lawmaker or Thaler and Sunstein's public-spirited choice architect — Google is uniquely well suited to help further the aims of progressive government along the lines that President Obama described, creating a "common baseline of facts and information." So will Google someday embrace that role

Adjusting the Signals

There has long been a fundamental tension between the dual missions — being trusted as the source of objective search results and Not Being Evil — by which Google has sought to earn the public's love.

That this tension is now coming to a head is evident in a pair of statements from Google over seven years apart. In November 2009, [outrage arose](#) when users discovered that one of the top image results when querying "Michelle Obama" was a racist picture. Google responded by including a notice along with the search results that linked to [a statement](#), which read:

Search engines are a reflection of the content and information that is available on the Internet. A site's ranking in Google's search results relies heavily on computer algorithms using thousands of factors to calculate a page's relevance to a given query.

The beliefs and preferences of those who work at Google, as well as the opinions of the general public, do not determine or impact our search results.... Google views the integrity of our search results as an extremely important priority. Accordingly, we do not remove a page from our search results simply because its content is unpopular or because we receive complaints concerning it.

Compare this statement to the company's [April 2017 announcement](#) of its efforts to combat fake news :

Our algorithms help identify reliable sources from the hundreds of billions of pages in our index. However, it's become very apparent that a small set of queries in our daily traffic ... have been returning offensive or clearly misleading content, which is not what people are looking for.... We've adjusted our signals to help surface [rank higher] more authoritative pages and demote low-quality content, so that issues similar to the [Holocaust denial](#) results that we saw back in December are less likely to appear.

Google links to a [December 2016 Fortune](#) article that explains, "Querying the search engine for 'did the Holocaust happen' now returns an unexpected first result: A page from the website Stormfront titled 'Top 10 reasons why the Holocaust didn't happen.'"

The example is instructive. The problem here is that Google does not claim that "as with the spammy payday loan results" there were any artificial tactics that led to this search result. And Google's logic "offensive or clearly misleading content ... is not what people are looking for" is peculiar and telling. For search results are supposed to be objective in no small part because they're based on massive amounts of data about what other people have actually looked for and clicked on. Google seems to have it backward: The vexing problem is that people are increasingly getting offensive, misleading search results because that's increasingly what people are looking for.

Google is now faced squarely with the irresolvable conflict between its core missions: The information people objectively want may, by Google's reckoning, be evil. Put another way, there is a growing logic for Google to transform its conception of what is objective to suit its conception of what is good.

The most recent update to Google's Code of Conduct, [released in April](#), may be telling. [The previous version](#) had opened with the words "Don't be evil" as defined, among other things, as "providing our users unbiased access to information." But the new version opens with an unspecified reference to "Google's values," adds a new mention of "respect for our users," and now omits any assurance of providing unbiased information.

The present moment, then, offers Google a unique opportunity to recast its public role. In the Trump era, no company is better suited to combat fake news, or to answer complaints that the American public is poorly informed on matters of public policy. Barack Obama may have been boasting in 2007 when he told his Google audience that he would let opponents "know what the facts are," but Google is equipped to deliver on that promise. And if progressives persist in their belief that science and facts prove their policy preferences objectively superior, and their related belief that the public's lack of consensus on factual questions poses a threat to democracy, then Google seems the best company to lead, in Obama's words, "a serious conversation about what are the business models, the algorithms, the mechanisms whereby we can create more of a common conversation."

In President Eisenhower's [1961 farewell address](#) in which he famously described a looming military-industrial complex, he also warned that in holding scientific research and discovery in respect, as we should, we must also be alert to the equal and opposite danger that public policy could itself become the captive of a scientific-technological elite. Past moments of alignment between industry and government are rarely remembered fondly as exemplars of public-private cooperation in the national interest. Rather, they tend to be remembered as moments of dangerous influence of private interest over public policy—especially by progressives, with reliable invocations of Eisenhower.

Yet it is this very logic that may now demand the opposite response—for more and more progressives view Google's influence on public policy as *already* dangerous precisely because it is *not* more actively altering its product to serve the public good. Where before Google could respond to any complaint about its search results by saying, *Sorry, our hands are tied—the algorithm did it*, its many recent interventions on political grounds mean that it no longer has such cover. And the pressure for Google to adopt ever more expansive interpretations of its exploitative, authoritative, and what people are looking for will doubtless rise.

If Google were to embrace the growing desire for it to become an active player in the fight against misinformation, then it would go a long way toward dousing the increasingly heated criticism of its monopoly status. Facing strident calls for antitrust action, especially from the left, Google may find it prudent to proactively employ its tools in service of the particular vision of the public good that progressives have embraced, and to be seen as the world's best hope for defending facts, evidence, and science, as it chooses to define them. And then, instead of seeking to punish Google, modern progressives may find their goals better met by quietly partnering with it.

GOOGLE COVERS ELON MUSK'S CORRUPT ASS!

Google and Tesla Motors are partners in actual crimes

- Tesla's Crony Government Subsidies Are The Biggest Taxpayer Rape In History**
- The Silicon Valley Mafia Soy Boys believe that driving a Tesla will offset their sexual inadequacies and that allowing Tesla to fail will hurt their political message points**
- Anti-Tesla activists have tricked the Silicon Valley Mafia into dumping (and wasting) billions of dollars of their VC funds into Tesla stock to pump the NASDAQ valuation listings**
- Scientific web data records now prove that Google hid all negative news about Musk and Tesla**

Verifiable Facts Now Disclose an Epic Crime In Washington, DC!

Here are the facts, proven in news, law enforcement and public investigations:

**** Thousands of articles discuss the possibility that Silicon Valley billionaires may be sociopaths, or otherwise deeply disturbed men who believe they are above the law. These kinds of people have been proven, in many past cases, to resort to extreme and criminal behavior without a second thought.**

**** Google and Tesla are run by Silicon Valley billionaires.**

**** Proven by web archives and metrics, the only company in the world that has had all of it's negative articles hidden by Google is Tesla.**

**** Proven by web archives and metrics, the only company in the world to own a majority, and covert, interest in Tesla is Google, via it's staff and owners.**

**** Internet records prove that the only company in the world to have it's press releases moved to P8 authority status by Google, even though concurrent negative coverage had a higher volume in every other search engine, and even though they were just Musk's press releases, is Tesla.**

**** Both Google and Tesla investors spent tens of millions of dollars lobbying for the invasion of Afghanistan and promoted white papers lauding *Trillions of dollars of lithium in Afghanistan* and *Afghanistan is the Saudi Arabia of Lithium* .**

**** More than any other companies on Earth, Google and Tesla are staged to make the most profits from mining deals in Afghanistan, particularly the mining of lithium, indium and related metals.**

- ** Frank Guistra, Jacques Littlefield and a number of Russian oligarchs are all involved in big Middle East mining and funding Obama's Campaign and Hillary's campaign and got perks from the same in Government deals and were closely associated with Tesla and Google.
- ** Goldman Sachs is partners with Tesla and Google and made billions by skimming the very deals that crashed in the Steven Chu DOE give-away plus the Tesla and Google stock manipulations.
- ** Goldman Sachs has been charged with profiteering in the invasion of Afghanistan.
- ** Goldman Sachs has been charged with criminal-class commodities market manipulation of the very metals, being mined in Afghanistan, that Google and Tesla, Sachs partners, also profit from.
- ** Google's money guys and Tesla's money guys are either the SAME guys and/or all have financial relationships
- ** Google, Tesla and Goldman Sachs, using back-door, illicit cash transfer routes were the largest financiers of the Obama campaign.
- ** None of Elon Musk's companies would be in business without White House intervention and tens of billions of dollars of government handouts.
- ** In the HSBC â Swiss Leaksâ Google, Tesla and White House staff were discovered to have had â slush fundsâ .
- ** The head of the Department of Energy, and his staff, were promoted for nomination by the investors of Google and Tesla, who he had a personal and financial beneficiary relationship with.
- ** Eric Schmidt, the head of Google, has spent more time in the White House dictating national policy and federal hiring decisions (for his own benefit) than all of Congress combined. Schmidt even ordered his staff, and business partners, to be placed in charge of the FCC and U.S. Patent Office.
- ** Attorney General Eric Holder was promoted for nomination by the investors of Google and Tesla, who he had a personal and financial beneficiary relationship with.
- ** The financiers of Tesla and Google use â Flash-Boyâ algorithm stock market software manipulation services.
- ** After Steven Chu was thrown out of the Department of Energy for running a kick-back scheme to the very same people, a duplicate scheme was moved to the Department of Transportation to relay cash for â Driver-less Carsâ with the core beneficiaries, again, being Google, Tesla and their owners.
- ** The Afghan failures have cost the U.S. Taxpayers over six trillion dollars and the publication: **Pro-Publica**, has disclosed a hot bed of corruption deals associated with Afghan kick-backs, that continue to escalate.
- ** Tesla and Google â driver-less car projectsâ have been exposed as simply another scam to try to exploit the already failing lithium mining market and deals, because those particular cars use vast amounts of lithium, the mining deals for which are owned by Google and Tesla owners.
- ** From 2007 to today, Google Internet records prove that Google manipulated election information and public perceptions in order to seek to swing the election to the Obama campaign.
- ** Thousands of other provable financial, covert stock ownership, family trust fund and shell company disclosures prove that the suspects had a covert, organized, illicit political and business program underway, that they concertedly crafted.

Therefor...

Tesla and Google owners must have funded the Obama election campaign in exchange for the promise of vast monopolies in Afghan mining deals to be exploited in their electric car and Solyndra-type holdings. It is true and verifiable that these three companies funded the campaign and only they got those benefits and all of their competitors were targeted and damaged by the Obama Administration, which has ordered federal investigators not to investigate the matter. This seems to confirm that a trillion dollar kick-back scam was operated by senior White House staff and is the subject of a White House-ordered cover-up.

By [Daisuke Wakabayashi](#) and [Katie Benner](#)

SAN FRANCISCO — Google gave Andy Rubin, the creator of Android mobile software, a heroic farewell when [he left the company](#) in October 2014.

"I want to wish Andy all the best with what's next," Larry Page, Google's chief executive then, said in a public statement. "With Android he created something truly remarkable — with a billion-plus happy users."

What Google did not make public was that an employee had accused Mr. Rubin of sexual misconduct. The woman, with whom Mr. Rubin had been having an extramarital relationship, said he coerced her into performing oral sex in a hotel room in 2013, according to two company executives with knowledge of the episode. Google investigated and concluded her claim was credible, said the people, who spoke on the condition that they not be named, citing confidentiality agreements. Mr. Rubin was notified, they said, and Mr. Page asked for his resignation.

Google could have fired Mr. Rubin and paid him little to nothing on the way out. Instead, the company handed him a \$90 million exit package, paid in installments of about \$2 million a month for four years, said two people with knowledge of the terms. The last payment is scheduled for next month.

Mr. Rubin was one of three executives that Google protected over the past decade after they were accused of sexual misconduct. In two instances, it ousted senior executives, but softened the blow by paying them millions of dollars as they departed, even though it had no legal obligation to do so. In a third, the executive remained in a highly compensated post at the company. Each time Google stayed silent about the accusations against the men.

The New York Times obtained corporate and court documents and spoke to more than three dozen current and former Google executives and employees about the episodes, including some people directly involved in handling them. Most asked to remain anonymous because they were bound by confidentiality agreements or feared retribution for speaking out.

The transgressions varied in severity. Mr. Rubin's case stood out for how much Google paid him and its silence on the circumstances of his departure. After Mr. Rubin left, the company invested millions of dollars in his next venture.

Sam Singer, a spokesman for Mr. Rubin, disputed that the technologist had been told of any misconduct at Google and said he left the company of his own accord. Mr. Singer said that Mr. Rubin did not engage in misconduct and that "any relationship that Mr. Rubin had while at Google was consensual and did not involve any person who reported directly to him."

While Mr. Rubin's exit from Google after an inappropriate relationship was previously [reported](#), the nature of the accusation and the financial terms have not been disclosed.

In settling on terms favorable to two of the men, Google protected its own interests. The company avoided messy and costly legal fights, and kept them from working for rivals as part of the separation agreements.

When asked about Mr. Rubin and the other cases, Eileen Naughton, Google's vice president for people operations, said in a statement that the company takes harassment seriously and reviews every complaint.

"We investigate and take action, including termination," she said. "In recent years, we've taken a particularly hard line on inappropriate conduct by people in positions of authority. We're working hard to keep improving how we handle this type of behavior."

Some within Google said that was not enough.

"When Google covers up harassment and passes the trash, it contributes to an environment where people don't feel safe reporting misconduct," said Liz Fong-Jones, a Google engineer for more than a decade and an activist on workplace issues. "They suspect that nothing will happen or, worse, that the men will be paid and the women will be pushed aside."

"I Was the Liability"

Google, founded in 1998 by Mr. Page and Sergey Brin when they were Stanford University graduate students, fostered a permissive workplace culture from the start.

In Silicon Valley, it is widely known that Mr. Page had dated Marissa Mayer, one of the company's first engineers who later became chief executive of Yahoo. (Both were single.) Eric Schmidt, Google's former chief executive, once retained a mistress to work as a company consultant, according to four people with knowledge of the relationship. And Mr. Brin, who along with Mr. Page owns the majority of voting shares in Google's parent, Alphabet, [had a consensual extramarital affair](#) with an employee in 2014, said three employees with knowledge of the relationship.

SIGN UP

David C. Drummond, who joined as general counsel in 2002, had an extramarital relationship with Jennifer Blakely, a senior contract manager in the legal department who reported to one of his deputies, she and other Google employees said. They began dating in 2004, discussed having children and had a son in 2007, after which Mr. Drummond disclosed their relationship to the company, she said.

Image David C. Drummond, Alphabet's chief legal officer, had an extramarital relationship with Jennifer Blakely, a senior contract manager in the legal department who reported to one of his deputies. Credit Daniel Rosenbaum for The New York Times

Google then took action. Ms. Blakely said Stacy Sullivan, then the head of human resources and now chief culture officer, told her that Google discouraged managers from having relationships with subordinates.

“One of us would have to leave the legal department,” Ms. Blakely said. “It was clear it would not be David.”

Since the affair, Mr. Drummond's career has flourished. He is now Alphabet's chief legal officer and chairman of CapitalG, Google's venture capital fund. He has reaped about \$190 million from stock options and awards since 2011 and could make more than \$200 million on other options and equity awards, according to company filings.

Ms. Blakely was transferred to sales in 2007 and left Google a year later. The company asked her to sign paperwork saying she had departed voluntarily. She said she “signed waivers, releases and whatever else they wanted.”

Image

“Google felt like I was the liability,” Ms. Blakely said. Credit Cayce Clifford for The New York Times

In late 2008, she said, Mr. Drummond left her. They later fought a custody battle for their son, she said, which she won.

How Mr. Drummond was treated “amplifies the message that for a select few, there are no consequences,” said Ms. Blakely, 54. “Google felt like I was the liability.”

Google's sexual harassment policy states that violators may be terminated “but it was flexible in how it enforced the rules.”

In 2013, [Richard DeVaul](#), a director at Google X, the company's research and development arm, interviewed Star Simpson, a hardware engineer. During the job interview, she said he told her that he and his wife were “polyamorous,” a word often used to describe an open marriage. She said he invited her to Burning Man, an annual festival in the Nevada desert, the following week.

Ms. Simpson went with her mother and said she thought it was an opportunity to talk to Mr. DeVaul about the job. She said she brought conservative clothes suitable for a professional meeting.

At Mr. DeVaul's encampment, Ms. Simpson said, he asked her to remove her shirt and offered a back rub. She said she refused. When he insisted, she said she relented to a neck rub.

“I didn't have enough spine or backbone to shut that down as a 24-year-old,” said Ms. Simpson, now 30.

A few weeks later, Google told her she did not get the job, without explaining why.

Image

She waited two years to report the episode to Google after she said she wrestled with talking about it. A human resources official later told her that her account was more likely than not true and that appropriate action was taken. She said the official asked her to stay quiet about what had happened, which she did until Mr. DeVaul's public profile began rising in articles in [The New York Times](#) and [The Atlantic](#).

We would never tell a complainant to stay quiet, Chelsea Bailey, the head of human resources at X, said in a statement, adding that officials investigated and took appropriate corrective action. She declined to say what that was, citing employee confidentiality.

In a statement, Mr. DeVaul apologized for an error of judgment. He said X decided not to hire Ms. Simpson before she went to Burning Man and that he did not realize she had not been informed.

In another harassment case, Google paid Amit Singhal, a senior vice president who headed search, millions of dollars on the way out.

In 2015, an employee said Mr. Singhal groped her at a boozy off-site event attended by dozens of colleagues, said three people who were briefed on the incident. Google investigated and found that Mr. Singhal was inebriated and there were no witnesses, they said.

Google found her claim credible, they said. The company did not fire Mr. Singhal, but accepted his resignation and negotiated an exit package that paid him millions and prevented him from working for a competitor, said the people.

In a [blog post](#) in February 2016, Mr. Singhal said he wanted to focus more on philanthropy and his family.

Image

With Google silent about the circumstances of Mr. Singhal's departure, he found another lucrative job. Less than a year later, he became [head of engineering at the ride-hailing company Uber](#). Weeks later, the technology news website Recode reported that Mr. Singhal had [left Google after a misconduct accusation](#). Uber dismissed Mr. Singhal for not disclosing the inquiry.

Uber and Mr. Singhal declined to comment. In a statement last year, he said that harassment is unacceptable in any setting and that he had not engaged in any such behavior.

The \$350 Million Man

Mr. Rubin joined Google in 2005 when it acquired his start-up, Android, for \$50 million. Over the next few years, he helped build Android the software now used in 80 percent of the world's smartphones into a huge success.

Search had positioned Google as a dominant player on desktop computers, but [Android](#) extended its reach and put Google's maps, email and web browser on devices that people carry every day. The ads and mobile apps running on Android also generated [tens of billions of dollars in profit](#).

That success gave Mr. Rubin more latitude than most Google executives, said four people who worked with him.

Mr. Rubin often berated subordinates as stupid or incompetent, they said. Google did little to curb that behavior. It took action only when security staff found bondage sex videos on Mr. Rubin's work computer, said three former and current Google executives briefed on the incident. That year, the company docked his bonus, they said.

Mr. Singer, the spokesman for Mr. Rubin, said the executive is known to be transparent and forthcoming with his feedback. He said Mr. Rubin never called anyone incompetent.

Mr. Rubin, 55, who met his wife at Google, also dated other women at the company while married, said four people who worked with him. In 2011, he had a consensual relationship with a woman on the Android team who did not report to him, they said. They said Google's human resources department was not informed, despite rules requiring disclosure when managers date someone who directly or indirectly reports to them.

In a civil suit filed this month by Mr. Rubin's ex-wife, Rie Rubin, she claimed he had multiple ownership relationships with other women during their marriage, paying hundreds of thousands of dollars to them. The couple were divorced in August.

The suit included a screenshot of an August 2015 email Mr. Rubin sent to one woman. "You will be happy being taken care of," he wrote. "Being owned is kinda like you are my property, and I can loan you to other people."

In 2011, Mr. Rubin was appointed a [Google senior vice president](#) and started receiving about \$20 million a year in salary, bonus and stock-based compensation, said two former Google executives with knowledge of the terms. In 2012, Google also lent Mr. Rubin \$14 million to buy a [beach estate](#) in Japan. The loan was offered at below 1 percent interest, said people briefed on the transaction.

When Google combined management of Android with its Chrome division in 2013, Mr. Rubin [lost a power struggle](#) to Sundar Pichai, Google's current chief executive.

He remained highly valued. That year, Google offered Mr. Rubin a one-time bonus of \$40 million in stock and an additional \$72 million of stock over the next two years, said two people with knowledge of the terms.

Mr. Rubin [built a robotics division](#) within Google named Replicant. During a six-month span in 2013, he spent an [estimated \\$90 million](#) to buy eight robotics firms.

Around that time, Mr. Rubin was casually seeing another woman he knew from Android, according to two company executives briefed on the relationship. The two had started dating in 2012 when he was still leading the division, these people said.

By 2013, she had cooled on him and wanted to break things off but worried it would affect her career, said the people. That March, she agreed to meet him at a hotel, where she said he pressured her into oral sex, they said. The incident ended the relationship.

The woman waited until 2014 before filing a complaint to Google's human resources department and telling officials about the relationship, the people said. Google began an investigation.

In September 2014, a few weeks into the inquiry, Google's board of directors awarded Mr. Rubin a stock grant worth \$150 million, to be paid out over several years, said three people briefed on the decision. It was an unusually generous sum, even by Google's standards.

Mr. Page typically recommends how much senior executives are paid, said three former Google executives. Over the years, Mr. Page had told people he felt Mr. Rubin was never properly compensated for his

contribution to Android, two people who spoke to him said.

The \$150 million stock grant to Mr. Rubin was approved by the Google board's leadership development and compensation committee, composed of Paul Otellini, Intel's former chief executive who [died in 2017](#), and two of Google's earliest investors, [John Doerr](#) of the venture capital firm Kleiner Perkins and [Ram Shriram](#) of the venture firm Sherpalo Ventures.

Image

Larry Page, Google's co-founder, typically recommends how much senior executives are paid, said people familiar with the situation. Credit: Justin Sullivan/Getty Images

It is unclear if Mr. Page or the board knew of the investigation into the harassment complaint when Google approved the \$150 million grant for Mr. Rubin. Mr. Page did not respond to a request for a comment; Mr. Doerr and Mr. Shriram declined to comment.

Google's inquiry ultimately found the complaint against Mr. Rubin credible, said the two company executives familiar with the incident. While Mr. Rubin denied the accusation, it became clear that at the very least the relationship was inappropriate, they said. Mr. Page decided Mr. Rubin should leave, they said.

The \$150 million stock grant gave Mr. Rubin an enormous bargaining chip when he started negotiating his exit package about a month later. That is because an executive's stock compensation and how much of it they would leave behind is often taken into consideration during settlement talks.

When Google fires lower-level employees, it typically marches them out immediately and pays little, if any, severance. But for senior executives, Google weighs other factors, said former executives. A wrongful termination lawsuit could mean unwanted press attention for Google and the victims of a misconduct case, with a loss resulting in significant damages.

In the end, Google paid Mr. Rubin \$90 million, said two people with knowledge of the terms. The package was structured so that he received \$2.5 million a month for the first two years and \$1.25 million a month for the following two years.

A provision in the separation agreement precluded Mr. Rubin from working for rivals or disparaging Google publicly, they said. Google also delayed repayment of the \$14 million loan.

The company then went out of its way to make [Mr. Rubin's departure](#) seem amicable, including Mr. Page's public statement of gratitude.

Afterward, Google invested in Playground Global, a venture firm Mr. Rubin started six months after leaving the company. Playground has raised \$800 million. He also founded Essential, a maker of Android smartphones.

Last November, after the technology news site [The Information reported](#) that Google had investigated Mr. Rubin for an inappropriate relationship, he took [a leave of absence](#) from Essential. He has since returned to run it and is busy with speaking engagements and [investments](#).

Mr. Rubin's wealth, fueled by Google, has increased by 35 times in less than a decade. According to his ex-wife's civil suit, his net worth is now about \$350 million, up from \$10 million in 2009.

GOOGLE ELITES PUMP CHILDREN'S BLOOD INTO THEIR VEINS TO TRY TO STAY YOUNG

Young-Blood Transfusions Are on the Menu at Society Gala

There's no evidence in my mind that it's going to work.

• By [Rebecca Robbins](#), [STAT](#)

Credit: [ICSident Wikimedia](#) ([CC BY-SA 3.0](#))

WEST PALM BEACH, Fla. For the crowd of mostly baby boomers, who'd just finished their healthy lunch of salmon fillet on a bed of grains and vegetables, the warning could not have been more dire: You're running out of time.

We can't sit still. We don't have the time to do that," bellowed Bill Faloon, the 63-year-old former mortician addressing them from the stage. To his left and right, giant screens projecting [government actuarial tables](#) reminded the group of the projected year of our termination. Men of Faloon's age could expect to die in 2037. Any 83-year-old women in the room? They've got until only 2026.

Take that initiative," Faloon urged his audience of about 120 people who had flown in from as far as California, Scotland, and Spain. How? Paying to participate in a soon-to-launch clinical trial testing transfusions of young blood offers the greatest potential for everyone in this room to add a lot of healthy years to their life," Faloon said. Not only do you get to potentially live longer—but you're going to be healthier. And some of the chronic problems you have now may disappear.

ADVERTISEMENT

STAT got an inside look at this [\\$195-a-head symposium](#), held last month in this wealthy beachside enclave. It offered a striking view of how promoters aggressively market scientifically dubious elixirs to aging people desperate to defy their own mortality.

At STAT's request, eight independent experts reviewed [informational handouts](#) about the clinical trial, and all sharply criticized the study's marketing, design, and scientific rationale.

It just reeks of snake oil," said Michael Conboy, a cell and molecular biologist at the University of California, Berkeley, who's collaborated on studies sewing old and young mice together and transfusing blood between them. There's no evidence in my mind that it's going to work.

Beyond the questionable science, participants have to pay big money to join the trial. Faloon, an evangelist of anti-aging research who cut a slim figure in his black suit and had the thick dark hair of a younger man, acknowledged during his talk that it would be expensive to sign up for the trial.

People considering enrolling said they had been told they would have to pay \$285,000. But the Florida physician running the trial, Dr. Dipnarine Maharaj, said the final price tag is still being discussed in consultation with the Food and Drug Administration and is likely to change.

ADVERTISEMENT

There's long been a thriving market of supplements, creams, and pills that promise to forestall aging.

But lately, big players and investors have also spotted an opportunity: Google's parent company has invested heavily in its secretive anti-aging spinout, called Calico. A startup called Celularity last month [raised](#)

[\\$250 million](#) to try to use postpartum placentas to delay the aging process. And a company called Elysium Health has rallied Nobel Prize winners to sell a \$50-per-month supplement aimed at boosting levels of a molecule known as NAD+ thatâs hypothesized to play a role in promoting longevity, though not without [prompting rebuke](#) from some prominent doctors.

Lower-cost technologies and a receptive audience are expanding that economy, creating new opportunities for entrepreneurs to pitch everyone from Silicon Valley titans to middle-America retirees on unproven and costly services like banking stem cells and injecting [hormones](#).

Such services are often promoted at events that University of California, Davis, stem cell researcher Paul Knoepfler calls âinfomercial seminars.â In January, for example, a company called Celltex Therapeutics [pitched its stem cell treatments](#) to would-be patients over wine and shrimp at a Houston hotel.

Then thereâs the West Palm Beach symposium, held to recruit participants for a study testing what happens when aging people get infusions of plasma (the fluid part of blood packed with signaling proteins and other molecules but no red or white cells) from young people whoâve taken a drug meant to activate their immune system. Maharaj, a Scottish-trained hematologist and oncologist with a flair for salesmanship, plans to run the 30-patient trial at the [private practice](#) he owns in Boynton Beach, Fla.

ADVERTISEMENT

The study, which he describes as a Phase 1/Phase 2 trial, is a first-in-human test, which means that it is designed to evaluate only whether the experimental therapy is safe. But in his remarks at the symposium, Maharaj didnât hesitate to make bold promises about what the treatment could do to ameliorate the frailty that results from getting older.

âWeâre saying that we will defy aging,â Maharaj told the crowd at one point. âWe believe that this could benefit everyone who is here,â he declared at another moment.

The experts consulted by STAT were dubious. Among their top concerns: Mixed but intriguing evidence in mice doesnât yet justify testing this idea in humans, much less charging them a huge sum to sign up. And the study uses neither blinding nor a placebo group, design elements considered essential for rigorous medical research.

âThere is no way under heaven that they will be able to convincingly show whether this works or this doesnât work. Itâs a trial that is designed and destined to provide no valuable information,â said Dr. Steven Joffe, a pediatric oncologist and bioethicist at the University of Pennsylvania who performs bone marrow transplants. He called the scientific hypothesis âincredibly far-fetched.â

Asked about the critiques, Maharaj declined to comment, saying he had been advised to wait until he releases more information about the trial. He suggested that publicity is already impeding his ability to move forward with the study.

ADVERTISEMENT

PITCHING THE FOUNTAIN OF YOUTH

The âyoung blood projectâ symposium was gussied up as one of the dozens of galas that fill the winter social calendar here, with the pitch for Maharajâs clinical trial artfully slipped in before the dessert of fruit and custard tart.

It was held on a Friday in February, at a glitzy performing arts center overlooking a Hilton hotel and a Ruth's Chris Steak House. Five fountains spurted from a reflecting pool outside flanked by palm trees.

It's about a 15-minute drive north of President Trump's Mar-a-Lago club and some 250 miles south of the site of the conquistador Ponce de LeÃ³n's mythical search for the fountain of youth, now converted into a tourist attraction and a wedding venue.

"Hopefully, one day we'll be able to announce that Florida is truly the fountain of youth," Maharaj told the crowd inside while he talked up his clinical trial.

Maharaj is charismatic and impossible to miss with his tan suit, pink tie, and Scottish accent. He was the star of the show. He darted from table to table, talking to so many attendees that he didn't have time for lunch. And he left an impression: Without exception, attendees spoke glowingly about Maharaj in interviews with STAT.

ADVERTISEMENT

Maharaj made his name in Florida performing bone marrow transplants for cancer patients and, increasingly, offering nontraditional services to a wealthy clientele. His

outpatient clinic treats patients with blood cancers and other blood disorders while also offering nontraditional services like stem cell banking for babies and adults, an increasingly popular procedure promising future dividends that are [unproven and uncertain](#). (And Maharaj practices what he preaches: He said he's had his own stem cells collected and stored.)

Maharaj has become a frequent speaker on the Palm Beach social circuit. Photos show him [posing at Mar-a-Lago](#) and [shaking hands](#) with the celebrity physician Dr. Mehmet Oz. He was featured on the cover of Palm Beach Society magazine promoting the symposium.

The attendees were dressed up in slacks, ties, and elegant pantsuits. They were served food and drink throughout the day, beginning with made-to-order smoothies for breakfast and glasses of wine to cap off the afternoon. A rotating cast of a violinist, a harpist, and a pianist provided musical interludes between talks. Fresh white, pink, and green flowers decorated high tables, but if you looked closely, some of them were beginning to wilt.

In interviews with STAT, the attendees complained about ailments that hadn't bothered them when they were younger: Back problems. Bad hips. The aftermath of a stroke. Parkinson's disease. Arthritis.

Many of them voiced frustration with the medical establishment and pharmaceutical companies, which they said pay too little attention to fixing the root cause of disease. Others voiced fears of spending their final days hooked up to machines in a hospital bed.

Asked about their plans for enrolling in the trial, surprisingly few among the well-heeled crowd said the cost was too high. But if the experience of Darryl Thompson, 73, and his wife Sherry Thompson, 71, is any indicator, it may prove hard for Maharaj to convince many of them to enroll.

The Thompsons, who have three grown children and are both retired after careers in government, flew out to Florida from their home in Fort Worth, Texas, for the symposium. They were there because Darryl Thompson had made aging reversal research something of a pet project. He'd started taking many daily supplements and learning as much as he could after a series of health scares (high blood pressure, high uric acid, and an enlarged prostate for Darryl Thompson, and a diagnosis of congestive heart failure for Sherry Thompson).

Sherry Thompson's motivation for attending was simpler: "Quite frankly, I went because Darryl twisted

my arm to go," she said with a laugh.

By the end of the program, Darryl Thompson was eager to enroll in the trial, but he knew he didn't want to do it without his wife. And Sherry Thompson remained hesitant. She was worried about the money, and the time they'd have to spend flying back and forth from Texas to Florida once a month for a year. And she was nagged, too, by a sense that perhaps there's a natural order to things. That perhaps we aren't supposed to live longer than we already do.

In the end, Darryl Thompson couldn't convince her. But he plans to keep a close eye on the trial. "I'm hoping that they'll get the cost down and refine their techniques," he said. "Possibly my wife and I could be a candidate for the next round."

OFFERING PROMISING THERAPIES OR FALSE HOPES

Experiments like Maharaj's operate on the fringes of science, yet they have captured the public imagination. Young blood has become so alluring as a possible way to extend life that it inspired an [episode](#) last year on the HBO show "Silicon Valley," in which an aging tech mogul relies on blood infusions from a handsome young man known as "an infusion associate." Even the billionaire investor Peter Thiel is [rumored](#) to be personally interested in the experimental treatment.

Maharaj's trial wouldn't be the first to transfuse plasma from young donors into older people. A biotech startup called Alkahest, spun out from a Stanford lab, [reported results](#) in November from a placebo-controlled safety trial testing the effect of plasma from young donors on 18 patients with mild to moderate Alzheimer's. The patients who got the plasma didn't suffer serious side effects, but the group didn't see a statistically significant improvement in their scores on a widely used cognitive exam.

Meanwhile, a company called Ambrosia recently completed a [clinical trial](#) that charged about 80 people over the age of 35 a sum of \$8,000 to get an infusion of plasma from a donor between the ages of 16 and 25. Ambrosia plans later this year to try to publish those results in a peer-reviewed journal, said Dr. Jesse Karmazin, the company's founder.

Maharaj and the experts consulted by STAT said that, to their knowledge, Maharaj's trial will be the first to try a new twist on young blood infusions: injecting the young donors with a drug called granulocyte-colony stimulating factor, or G-CSF.

The body makes this glycoprotein naturally, but a form of it sold as Neupogen by Amgen is approved for cancer patients recovering from chemotherapy and for healthy people preparing to donate stem cells. It's used this way because it stimulates the bone marrow to produce white blood cells and certain stem cells and release them into the bloodstream. Maharaj said he chose to use G-CSF because he thinks it's the best way to mobilize the proteins and other factors into young plasma that he thinks could have a restorative effect on the older participants. (Maharaj [holds several patents](#) associated with the therapeutic use of G-CSF.)

To run his study, Maharaj plans to recruit donors between the ages of 18 and 35 and inject them with G-CSF and collect their plasma. In return, they'll be paid up to \$750.

That plasma will be infused once a month for 12 months into the veins of the older clinical trial participants. Maharaj will enroll people who are between the ages of 55 and 95 and who demonstrate several indicators of frailty such as exhaustion and weight loss.

To evaluate whether the experimental treatment is safe and whether it might be able to reduce frailty, Maharaj plans to run a battery of baseline testing on each clinical trial participant before they get their first infusion of young plasma and then monitor their changes for two years: That means cognitive exams, questionnaires

about their quality of life and their indicators of frailty, and tests to measure biomarkers he believes are linked with aging, such as telomere lengths and DNA methylation.

Maharaj said he didn't use a placebo group in his study because it was too expensive and because he believes that the baseline assessment will allow participants to serve as their own control. He said that if his trial shows promising results, he'll run a second randomized trial using a placebo.

Maharaj has not published any animal studies testing the procedure he's proposing to try in humans. He did, however, [publish a paper](#) last year documenting a study in which he infused three cancer patients with white blood cells from young donors who had been injected with G-CSF. The trial was originally intended to enroll 29 patients, but Maharaj did not answer questions about why the paper featured results from only three of them.

Asked by STAT for citations in the published literature that provide the scientific basis for his new trial, Maharaj pointed to six studies. One was conducted on human cells in lab dishes. The other five were conducted in mice; they found that, after being exposed to the blood of young mice, old mice had less abnormal thickening of their heart, grew more nervous tissue, and saw improved cognitive function, among other changes.

But the Harvard stem cell and regenerative biologist Amy Wagers, a co-author on three of the mouse papers, said in an email to STAT that she does not agree that her team's studies provide a scientific basis for Maharaj's clinical trial.

The problems are many: Young blood didn't do much for old mice in [other studies](#). Promising findings in mice are rarely replicated in humans. And the trouble with extrapolating so much from mouse studies is that nobody has actually shown over the long term how long these quote-unquote improvements persist, and we don't know whether it's broadly improving aspects of aging or it's specific to certain tissues," said Matt Kaeberlein, a biologist who studies aging in dogs and other animal models at the University of Washington.

Clinical trials that charge enrollees to participate are ostensibly aimed at giving patients early access to promising therapies — often in the fields of stem cells or aging reversal — that are too unusual or have too little profit potential to get funding from traditional sources such as companies, foundations, or the National Institutes of Health. But critics worry that such trials too often exploit desperate patients, offering them false hope of restored health while doing little or nothing to advance scientific research.

Maharaj said he spent three years seeking funding for his trial from foundations but couldn't close a deal. He said he thinks he was turned down because his focus on attacking aging-related frailty was too novel and unfamiliar to would-be funders.

As of mid-February, no patients had officially enrolled in Maharaj's study, though about 10 had demonstrated interest by calling and leaving their information with his private practice, Maharaj said. (He declined STAT's request to interview these people and would not provide an update on how many patients had enrolled by the end of February.)

At the symposium, Maharaj said that he had received the go-ahead to proceed with the study from the FDA and the Western Institutional Review Board, but did not provide the documents STAT requested to verify those claims.

Lauren Smith Dyer, an FDA spokeswoman, declined to comment on Maharaj's trial. In cases in which a clinical trial that's regulated by the agency proposes to charge patients to receive an experimental drug or certain biological products, the sponsor must obtain written authorization from the FDA, Smith Dyer said.

Maharajâ s study is not listed on the government database of human studies known as clinicaltrials.gov, though he said it will be registered on the site in the next few days.

A CHEERLEADER WHO WANTS TO LIVE FOREVER

Faloon has become perhaps Maharajâ s most vocal cheerleader. He runs a group called the [Society for the Rescue of Our Elders](#), meant to accelerate and [raise funds](#) for aging-reversal research, as well as an [online business](#) that sells â life extensionâ supplements.

He has no formal stake or involvement in the young-blood clinical trial, but heâ s promoted it heavily. In recent emails to the roughly 2,000 members of the society and a posting on the groupâ s website, Faloon wrote that enrolling in the study would cost \$285,000 â in an effort, he said, to be transparent to people who couldnâ t afford it.

The publicity seems to have backfired, however. Faloonâ s communication contained â information on pricing which the IRB had not yet seen,â Maharaj said. â As a result, the IRB has inquired as to the genesis of that press release, and it has negatively impacted on my ability to proceed with this study until the IRB is satisfied that it is receiving all information relevant to the study.â (Faloonâ s team has since removed the pricing information from the societyâ s website, in the hope that Maharajâ s study can proceed as planned.)

Faloon has long bristled at what he sees as excessive regulation holding back life-saving and -extending therapies. He has tussled in particular with the FDA, which in 1987 raided his supplement companyâ s warehouse, leading to an indictment for allegedly conspiring to import unapproved drugs into the country; the indictment was eventually dropped. Over the years, heâ s opened what heâ s called an â [FDA Holocaust Museum](#),â which compared the number of needless deaths he believes the agency has caused to those caused by the Nazis, and a â [Church of Perpetual Life](#)â to proselytize his gospel of everlasting life on earth.

He doesnâ t hesitate when asked whether he wants to live forever â the answer is yes â but heâ s hedging his bets. Heâ s also a cryonics enthusiast, he said, â because in the event I die before immortality is achieved, cryopreservation offers me the opportunity to be transported into the future where revival may be possible.â

When flying, Faloon used to lug a thermally insulated helmet in his carry-on bag that heâ d put on during takeoffs and landings. The idea was that, in the event the plane crashed and burned, his head could still be salvaged and frozen. But he no longer takes his helmet on flights, he said, in part because heâ s not sure it will actually work.

The other reason? Itâ s too much trouble, he said, to get his helmet through airport security.

Kiss of Death and the Google Exec

The mysterious death of a tech executive and his last night with an exotic beauty on his yacht -- now a court decides her fate and stunning new details are revealed

Produced by Allen Alter and Patti Aronofsky

[This story previously aired on May 26, 2015. It was updated on July 30, 2016.]

When he's not out looking for the big wave, there's a big story that has consumed Stephen Baxter, a reporter for the [Santa Cruz Sentinel](#) and a "48 Hours" consultant: the mysterious death of Google executive Forrest Hayes at the city's sprawling marina.

Forrest Hayes

Forrest Hayes Memorial Site

"Forrest Hayes was ... 51 years old. He lived in a pretty upper crust neighborhood," Baxter told "48 Hours." "He was a pretty high powered guy and ... obviously had a lot of assets; he lives in a \$3 million house in Santa Cruz."

In 2013, one of the boats docked in Santa Cruz Harbor was the majestic 46-foot-long yacht called "Escape." It belonged to Hayes. Not surprisingly, the tech exec outfitted his boat with some of the most expensive tech gear out there -- about \$200,000 worth, including a sophisticated security system complete with high-def cameras.

Inside, Hayes spared no expense on creature comforts, including a leather ceiling and a \$8,000 captain's chair.

[48 Hours Segment Extras](#)

[A look inside Forrest Hayes' "Escape"](#)

The Google executive's death caught the attention of Michael Daly. He's an investigative reporter for [The Daily Beast](#), in New York, and also a "48 Hours" consultant.

"I think ... he was practical and imaginative at the same time," Daly said. "Forrest Hayes started in his native Michigan ... at the Ford Motor Company as a manager, he went to California for Sun Microsystems and he went on to Apple..."

Hayes then went on to Google for a high-paying job at their top-secret location, where impossible dreams are transformed into reality.

"He was hired ... to work in Google X, which they call their 'moonshot factory.' As in, you know, the most extreme, wildest, imaginative, farthest reaching ideas they could have. You know, like Google glasses, self-driving cars," Daly explained. "He was the guy who was actually gonna make some of these things happen."

It's a place so secretive, colleagues from Google X refused to divulge exactly what Hayes did there. To get away from the pressures at work, Forrest Hayes would head to the marina, and onto his prized possession.

"One of the larger boats in the harbor, I think that's fair to say," said Baxter.

What police would eventually discover was that the married father of five had a secret liaison. She was a young and exotic dark haired woman covered with very distinctive tattoos. And she would be the last person to see Forrest Hayes alive.

"On the night of November 22, 2013 ... Forrest Hayes was on his yacht ... and he didn't come home that night. And his wife became concerned. She called the captain they retained for this yacht and he went and he got on the boat," said Daly.

Hayes' body was found lying in the main cabin. The captain immediately called 911, but surprisingly, it would take months before the Google executive's death made headlines.

"There was -- really no report of his death," Baxter said. "Obviously, the police in this case were trying to keep that under wraps as they investigated."

Santa Cruz Deputy Police Chief Steve Clark has been on this case since day one.

"The media's gonna want to know right off the bat. 'Who is it?' 'Who's responsible?' 'Is this a homicide?' 'Is this a murder?' We didn't have enough to really even put that out. We were busy building the case," Clark told "48 Hours" correspondent Maureen Maher.

Building the case wasn't easy -- despite some initial crime scene clues.

"There were two wine glasses there, both which appeared to have been used," said Clark

Investigators zeroed in on Hayes' cell phone, launching an exhaustive digital search. They made a stunning discovery. Hayes had a profile page on a dating website, called SeekingArrangement.com. It would be a critical clue in learning the identity of that mystery tattooed woman.

It was just a few days before Thanksgiving 2013. What happened that night was recorded by the boat's video cameras. One camera in particular caught the very last moments of Hayes' life in chilling detail.

"Initially, we were told that the video wasn't available from that particular camera -- that actually showed the cabin of the boat. ...there was indeed video that was uploaded to a cloud server. And the video from that camera was indeed available," Clark explained. "That was one of those moments where you feel like, you know, it was 4th and 1. And you got a first down.

Actually, it took three months and a court order for detectives to get their hands on that video. When they did, it was explosive.

"That video was shocking to me," said Clark.

"What do you see on this video?" Maher asked.

"Well, the video's everything. The video is the case," Clark replied.

Police have yet to release the video, but described in detail to "48 Hours" exactly what they say happened that night between the couple: essentially, it was a party for two -- drugs included.

"They greet each other -- a quick hug-- just a quick embrace. You can see that they're

engaged in conversation. But there's no audio," Clark said. "...then, eventually, she -- gets to the point where she starts to prepare drugs ... for injection. We see her very clearly. She brought all of the equipment with her. She brought the drugs with her."

As police would learn, the drug of choice that night was heroin.

"We see her prepare the syringe. We see her -- it looks like she's injecting herself, but her back's to the camera," Clark explained. "He watches this happen. And then she eventually injects him."

"Do you feel like, at any point when you're watching the video, that this is a guy who is afraid and doesn't want to do this?" Maher asked.

"I get the impression ... he's nervous. He's uncertain. But he's going along with it," said Clark.

"And what happens then?" Maher asked.

"Almost immediately, he starts to go into distress," Clark explained. "At some point, she comes to him. It looks like she tries to revive him a bit ... by patting him on the face and talking to him, holding his head as he slumped forward on the chair.

"And you or I, if we found ourselves in that situation, would've been on the phone to 911, sayin', 'Oh, my gosh. Something terrible's happened. We need help.' And she does none of that," Clark continued.

Instead, Clark says the video shows the woman trying to remove any evidence that she was ever there -- wiping fingerprints and cleaning up her drug paraphernalia.

"While he's slumped over on the floor?" Maher asked.

"While he's on the floor," Clark replied.

"She's stepping over him?" Maher asked.

"She is literally walking around the cabin of the boat ... stepping over him, grabbing her glass of wine, carrying it around the boat cabin with her," said Clark.

Clark says that portion of the video with Hayes on the floor of the cabin goes on for seven minutes.

"And that's seven minutes that emergency medical personnel could've been there could have done something and could have reacted to this situation to save Mr. Hayes' life. But instead, she does nothing, nothing to call for help or to fix this. You know, and that's the crux of the case," Clark told Maher.

Alix Tichelman

diaz digital media

Armed with that video, police hit pay dirt. They were able to match the woman with those distinctive tattoos to a profile on the dating website Hayes had used. She was a 26-year-old aspiring model. Her name? Alix Tichelman.

WEB OF SECRETS

The wealthy Google executive found the exotic model in a somewhat secret world, where real names are rarely used.

Technically, Alix Tichelman and Forrest Hayes met in Las Vegas -- not at an upscale casino or one of the fancy hotel lobby bars -- but through an online website which is headquartered just a stone's throw from the strip. But as "48 Hours" discovered, it's not your typical dating website.

"What year did you start SeekingArrangement?" Maher asked the site's CEO, Brandon Wade.

"It was started in 2006 from a bedroom in San Francisco, actually," he replied.

It may have the look and feel of a start-up, but with nearly four million members worldwide, this is big business.

"SeekingArrangement.com is -- a Sugar Daddy dating website, so we match wealthy guys and girls looking to pamper and spoil. And, of course, younger men and women looking to meet those wealthy people," Wade explained.

Wade, a boyish 43-year old, says he's become a multi-millionaire from all the "arranging" he's been doing.

"Is SeekingArrangement about arranging sexual relationships for money?" Maher asked.

"It is about finding romance and passion," Wade replied. "I'm unapologetic about the fact that sex is involved in a romantic relationship. And money is involved in a romantic relationship. But that doesn't make the romantic relationship prostitution."

Deputy Police Chief Steve Clark, the point man in the Hayes death case, strongly disagrees.

"It doesn't take a Sherlock Holmes to take a look at that website and figure out exactly what was going on there," he told Maher. "The titles of the individuals are Sugar Babies and Sugar Daddies. You know, that's -- there's no innocent connotation there behind any of that."

"What is 'Budget'? That's what he's willing to spend?" Maher asked Wade as they looked at the website.

"That's his sort of lifestyle. So it could be going out for dinners, paying for that. Going on trips," he explained.

"OK. So does a woman think you're gonna spend \$3,000 on me? A Sugar Baby thinks, 'You're gonna spend -- \$3,000 on me,'" Maher asked.

"Yeah, on the relationship," Wade replied.

Wade is proud that his membership ranks include employees of leading Fortune 500 companies, including, he says, from Google.

"Is Forrest Hayes a typical client?" Maher asked Wade.

"I would say -- he is-- an average client of ours," he replied.

"Married tech executive looking for some sort of arrangement," Maher commented.

"Yep. Forty percent of the guys are married," said Wade.

It's unknown if Hayes was fulfilling the "expectations" of any Sugar Babies' lifestyle requests, which range from a \$1,000 to over \$10,000 in monthly Sugar Daddy "gifts."

"Can you tell us anything about Alix Tichelman's profile on SeekingArrangement?" Maher asked Wade.

"Well, the only thing I can say is that it looked like any other normal profile, so it was approved. And -- there was no indication that she was soliciting money for sex. At least not with that profile," he replied.

[20 Photos](#)

[Who is Alix Tichelman?](#)

After Hayes' death, investigators began tracking Alix Tichelman on social media. Fearing she might leave town, they hatched a plan to catch her using SeekingArrangement.com.

"When she posted on Facebook something to the effect of -- I plan to go back to Georgia -- that's when they decided to really go in and pursue her on the same website, just the way Forrest had, and pose as a john and lure her back to Santa Cruz," reporter Stephen Baxter explained.

"We started seeing chatter from her that indicated she was either gonna move out of the country or out of the state," said Clark.

"There's now a clock on this 'cause she's about to head South," reporter Michael Daly explained. "So, they do kind of a classic sting."

"We sold out our detective and made him set up a profile -- under a different identity and made up a whole story about him. We then posted that out there and we reached out to Alix Tichelman through SeekingArrangements," said Clark.

Code-named "Sebastian," that detective began emailing and texting with Tichelman, hoping for a rendezvous.

"Eventually, we convinced her to come down and meet with us for an agreed-upon ... arrangement for sex, for prostitution, and for a sum of money," said Clark.

"Police said ... they deposited some money -- several hundred dollars into her bank account with a promise of ... at least \$1,000 upon arrival and everything else," Baxter explained.

"This did not appear to you that this was the first time she had negotiated such a situation?" Maher asked Clark.

"No. In fact ... she kinda called us out, called us a cheapskate. Told us that, you know, many of her clients pay twice that," he replied.

Eight months after the death of Forrest Hayes, Alix Tichelman once again showed up in Santa Cruz County, this time at a secluded resort. Once again, she came with heroin in her bag expecting to hook up with the Sugar Daddy from SeekingArrangement. And once again, it did not go as planned.

"When you said, 'We're the cops. And we're the ones you've been communicating with,' what was her reaction?" Maher asked Clark.

"Oh, she -- she cried," he replied. "...that's when we saw panic."

Alix Tichelman booking photo

Santa Cruz Police Dept.

Alix Tichelman, 26, was stunned. Police arrested her for prostitution and charged her in the death of Forrest Hayes.

"...this was a crime. This wasn't just some accident gone awry," Clark said.

Or was it? What happened that night, says Tichelman's defenders, is a lot more complicated.

WHO IS ALIX TICHELMAN?

Perhaps no one was more surprised by the arrest of AlixTichelman than Chad Cornell. The construction worker with a passion for writing and playing music was in love with her.

"For me, I mean, she was somebody completely different," Cornell told Maureen Maher. "When I first saw her, I couldn't help but to say something ... She has a very darker style. And I always thought she was really beautiful. And almost like, you know, the Angelina Jolie kinda look."

Alix Tichelman and Chad Cornell

Cornell had no idea how dark her life really was.

"Did you believe she was falling in love with you?" Maher asked Cornell.

"I did," he replied.

Cornell thought his girlfriend was a model -- there were countless images, a swimsuit commercial, and a makeup tutorial she did online.

And as far as he could tell, she was always answering modeling calls.

"She'd get all dolled up and go to a photo shoot," Cornell said. "...she'd usually make about \$1,000 or so when she'd go out to these modeling shoots."

So imagine how he felt to learn months later that his beloved girlfriend was now being accused of doing something altogether different for all that money.

"I got a text with the news link on it ... and kind just fell over on the couch in shock," Cornell said.

The woman he once thought he'd spend the rest of his life with was now not only charged with prostitution -- but also in the death of Google executive Forrest Hayes.

"What are you thinking? This is a woman you were in love with," Maher commented.

"Yeah, I mean obviously, I was devastated you know. I turned white," said Cornell.

As the news sank in, to his complete amazement, Cornell realized that just hours before Alix Tichelman met up with Forrest Hayes on that fateful night, she was with him.

"We were hanging out that day actually. She told me that some of her long-time high school friends were in Santa Cruz, and had a boat and she had planned to go hang out with them," he explained. "Later that night, she actually woke me outta bed with a phone call. She's you know really frantic on the phone. She sounded very upset."

"What was she talking about?" Maher asked.

"She talked about how her friends had started doing heroin and a bunch of hardcore drugs on the boat and made her uncomfortable. And that she had to leave," Cornell replied.

"But you believed on that call that she sounded genuinely upset?" Maher asked.

"Crying, sniffing. I mean upset upset," said Cornell.

- **[Photos: Who is Alix Tichelman?](#)**

Because the truth, he now knows, was much worse. And it's left him wondering whether he ever really knew who Alix was.

"Who is Alix Tichelman, right? Who is she?" said reporter Michael Daly.

Daly did what police investigators did, and using the tools of Hayes' employer, he 'Googled' her.

"This, the police discovered, was Alix Tichelman's Twitter account," he explained, navigating through the profile AKKennedyxx.

"One x short of triple x," Daly said of her Twitter handle. 'Baddest bitch, model, stylist, hustler, exotic dancer.' Those are her words. These are the pictures to go with the words."

Twitter

"This has the charming inscription, 'To death do us part,' Daly said of a photo Tichelman showing off a tattoo on her arm that was posted to the account. "You might start believing less in coincidence on seeing that."

But to Daly, Tichelman's postings looked more like someone trying to create an image rather than someone obsessed with killing. That's because he came across this post:

*"My beautiful mother and I out for lunch. *no makeup face*"*

"I mean this is a young woman who wants to be with mom," Daly commented of the tweet, which included a photo of Tichelman and her mother smiling.

Tichelman posted it just months before her arrest for Forrest's death

"It makes you think there's a fuller story," said Daly.

So how did it come to this? Childhood pictures show a cute blonde tomboy who appeared to have all the advantages in life growing up with her sister, Monica, who would become an investment counselor, her mother, Leslie Ann, and her father, Bart, a CEO for a technology company and a pretty good poker player.

"And he at one point found himself playing with some of the best poker players in the world and he won like \$400,000," said Daly.

Alix Tichelman spent her early teens in an Atlanta suburb where she played sports and won writing awards.

"Her friends say that she's very smart, very deep," said Daly.

But also very troubled.

"Her experiences with boys were not always happy ones," Daly explained. "She had eating disorders ... she was taking drugs."

Desperate, her parents went looking for help and located a school that they thought would give her special attention.

"So they found this place called the Hyde School in Maine," Daly continued.

Megan was also a student at the Hyde School, where Tichelman spent a few months.

"I can feel, like, pressure in my chest. It's nerve-wracking," she said driving to the school.

Megan asked "48 Hours" not to use her last name, but agreed to travel back to the Hyde School campus.

"I want people to see this very pivotal part of her life, that I feel, probably affected her at a very ... huge point in her development ... and why she is who she is," she said.

"Do you remember when you first met Alix, do you happen to remember the very first time you saw her?" Maher asked.

"One-hundred percent," Megan said. "She was gorgeous and she was very awkward."

The cute blonde girl next door was long gone.

"She barely ate. She was very skinny. She was rail-thin," Megan said. "She was emotionally kind of closed off."

"I think the big question then is why? What had happened to her?" Maher asked.

"I don't know the truth to that. She never told me there was a specific catalyst," Megan replied.

But Megan says Alix Tichelman did hint at some traumatic events.

"We talked about ... the fact that we had issues trusting men," she said. "We had become numb to a lot of things."

Tichelman had started cutting herself. A photo of Alix in her then-bunkmate's scrapbook reads "psycho roomie" and "look at the cuts on her arm."

"Alix Tichelman was actually the first person that I met who did that," said Ashley Kent, who lived in Tichelman's dorm. "She came to the school with the scars. She had already etched things into her arm, and she had already made this ... image of herself as this like devil person ... that's how she dressed, kind of like a devil worshipper."

But was that really who Alix was?

"She was actually a really nice girl. It was very much like a front that she putting on, an image," said Kent.

Megan noticed it, too.

"Once you bypass those walls, she was just a normal girl who was scared," she noted.

"And what was she scared of?" Maher asked.

"I think herself, honestly. I mean we didn't know who we were. We had resorted to things that not every person chooses. We had been in trouble.

And at Hyde, it seemed like Tichelman was always in trouble. Megan says they punished her.

"You're forced to do manual labor, physical labor. They basically tell you what you can and can't do," Megan explained.

Megan says she and Alix were forced to build a road.

"We hoed it, each person, and we weeded it. And then they made us cart like wheelbarrows -- like huge wheelbarrows full of rocks up and spread 'em, so we basically built a dirt road on campus," she said.

Ashley Kent remembers one night waking up to Alix screaming. What happened sounds like a scene out of a Stephen King movie.

"She like kinda walked down the halls and like was cutting herself really late at night," she said.

"She began just to hurt herself because she felt that's what she deserved," said Megan.

When it didn't work out at Hyde, Tichelman's parents tried other schools. But the

worse was still to come.

"Well, she talked about taking heroin when she was in her teens," said Daly.

And by her early 20s, Tichelman was living in San Francisco, working strip clubs like Larry Flint's Hustler, and then a place called the Condor. Eventually, she found her way back home to Atlanta, where her life would take a dramatic turn.

"This kinda great thing happens. She meets a guy named Dean," said Daly.

Alix Tichelman and Dean Riopelle

Dean Riopelle was much older but so in love with Alix Tichelman he wanted to marry her.

"So maybe there's gonna be a happy ending anyway," Daly commented.

Then, in September of 2013, two months before Forrest Hayes died, Tichelman's fianc , Dean Riopelle, died with heroin in his system:

911 Call: Um, I don't know I think my boyfriend overdosed or something like he ... he won't respond, and he's just laying on the ground. Oh no.

Was it an unfortunate coincidence? Or something more sinister?

ANOTHER HEROIN DEATH

The Masquerade -- it's one of the hottest concert venues in Atlanta, Georgia, and it all belonged to 53-year-old Dean Riopelle, a former cross dressing singer for the rock band the "Impotent Sea Snakes."

In September of 2013, Riopelle died of a heroin overdose. His girlfriend at the time:

Alix Tichelman.

Tichelman called 911 after she says she discovered Riopelle unconscious in his North Atlanta home. That was just two months before she was with Google exec Forrest Hayes when he died.

"We were surprised the similarities in their case to our case," said Santa Cruz Deputy Police Chief Steve Clark.

Based on Tichelman's arrest in Santa Cruz for the death of Forrest Hayes, police in Milton, Georgia, are now taking a second look at Riopelle's death. What was first ruled an accidental overdose might very well become a criminal matter.

One person who believes Tichelman should be held responsible for Riopelle's death is his former employee, Khristina Brucker.

"I think she had something to do with his death, I really do," said Brucker.

For a few months in 2012, Brucker, an aspiring model, lived in Riopelle's house, taking care of his children from his previous marriage and his pet hobby: raising dozens of monkeys.

"He said he had a dream about monkeys one day and he just started collecting them. He had the money. So why not?" Brucker told Maureen Maher.

Riopelle told an Atlanta TV station he had hopes of turning his property into a zoo.

"Anybody would spend 20 minutes or an hour with one would see they have a little bit more personality than most other animals," he said.

But Brucker says his real passion was the woman also featured in that news story, Riopelle's live-in girlfriend, Alix Tichelman.

"Oh, he loved her. He absolutely loved her. He wanted to marry her and she wanted to marry him, too," said Brucker.

Dean Riopelle loved everything about Alix Tichelman -- except the drugs. By the time Tichelman hooked up with Riopelle, she was a full blown heroin addict. Brucker says Riopelle didn't share Tichelman's bad habits.

"Did you ever see him drink?" Maher asked.

"Never," Brucker replied.

"Smoke?"

"Never."

"Do drugs?" Maher pressed.

"Not once," said Brucker.

Brucker stopped working for Riopelle almost a year before he died. Still, she's sure he would never inject himself with heroin. But she wonders if Alix Tichelman might have.

"Do you think that's what happened?" Maher asked Brucker.

"I think it's possible, especially with the case in Santa Cruz where she actually did that," she replied.

"The idea that she's going around randomly sticking people with heroin needles is preposterous. These are grown men. They know exactly what they're doing," said Todd, an Atlanta businessman.

Todd asked "48 Hours" not to use his last name, but says, as a close friend of Alix Tichelman, he could no longer keep quiet about what he knows about the couple.

"She was devastated after Dean passed away," he said.

Todd says, not only did Riopelle drink -- he drank a lot.

"But she loved him and he loved her. If he were alive today, he would be the first one to bail her out of jail," he said. "And he would be absolutely mortified at how the people around him ... have treated her."

And Todd says Riopelle was determined to get Tichelman off heroin. He sent her to rehab and even bought her an engagement ring. He texted Todd.

"This is August 30th of 2013 ... he was getting Alix a wedding ring. They were going to get married," Todd said of the text.

That's just three weeks before Dean Riopelle would overdose.

"She gets her ring, she picked it out today. We drug test every week. If she can stay clean for 14 months we will get married Halloween night 2014..." Todd said, reading aloud one of the text messages that have never been made public. He showed them exclusively to "48 Hours."

"Alix says this is the first time in 10 years she has gotten out of detox or rehab and lasted a whole week before shooting up again," Todd said, reading another text.

But Tichelman didn't stay clean for long. On Sept. 7, 2013, just 10 days before his fatal overdose, Dean Riopelle made a shocking discovery: Alix was online, advertising herself to men.

"She hated that she was compelled to do it because she had this addiction," Todd said. "There were guys who wanted to rent her penthouse apartments ... men with a lot of power and a lot of status. ...But she wasn't interested in anything except getting the money to support her habit. She loved Dean, she wanted to be with Dean, but she had this deep dark secret."

And, Todd says, when Riopelle found out, he flipped out.

"He said, 'Can I move all of the prostitute's s--- into your place tomorrow ... She is

better over there and I would like to bring her stuff to you today so I don't have to see the whore again,'" Todd said, reading Riopelle's text.

But Riopelle didn't kick Tichelman out. Instead, Todd says, he hit the bottle -- hard.

"Once he discovered the ad things began to fall apart. Dean desperately loved her. Dean wanted to keep her. But he couldn't figure out how to reconcile all of this," said Todd.

So, Todd believes, Riopelle tried something new.

Tichelman would later tell police she was in the bathroom when she heard what sounded like a crash. She went to the bedroom and found Riopelle on the floor.

An autopsy would show he had a fatal mix of heroin, pain killers and alcohol in his system.

"I'm convinced that what happened was Dean was trying to reach a connection with Alix on a deeper level. And he thought that if they could share this thing, this thing she was so attached to, that she couldn't let go of no matter what, that they could actually be together. And that's what he wanted more than anything in life," said Todd.

Following Riopelle's death, Tichelman sent text messages to Todd: "Gd why did dean have to die?"

In the texts she writes that her mother is coming and will move her to California to the family's new home two hours outside San Francisco. But Tichelman is trying to detox and tells Todd she is worried:

"I know that city well, like the Tenderloin where I used to live is the third biggest open drug market in the U.S. It takes two minutes to score and you don't have to know anyone. You can see why I'm worried," Todd said, reading the text aloud.

[48 Hours Segment Extras](#)

Texts show Alix Tichelman was trying to "get her act together"

Around Oct. 30, 2013, Alix Tichelman arrived in California. She immediately went back online and started advertising herself. Texting Todd: "Guys out here got mad money."

And within days she had a prospect. She was about to come into serious cash.

"This is on the second of November and she says an 'amazing guy' found her... 'He is the real deal.' Tomorrow she's going on his boat and for a few hours he's giving her \$400 to \$500 cash. Then a check for \$2,000," Todd said of another text. "Now, I'm relatively certain that the guy on the boat she's referring to was Forrest."

Three weeks later, on Nov. 22, Alix Tichelman was definitely with Forrest Hayes on his boat, where Todd believes she was simply making money to feed her addiction.

"Tell me one thing that happened on that yacht that was not absolutely consensual between two adults," Todd said. "Nothing."

STUNNING DEVELOPMENTS

On May 19, 2015, Alix Tichelman is back in court to have a date set for her trial.

She's been in jail for almost a year - her past modeling life a distant memory. Tichelman faces almost 20 years behind bars, charged in the killing of Forrest Hayes, along with drug possession and prostitution.

Her public defenders, Jerry Christensen and Larry Biggam, have insisted she is not a cold-blooded killer.

"Alix Tichelman did nothing that Mr. Hayes didn't want her to do. Two adults engaged in mutual and cooperative drug usage. And it went wrong. But it was an accident," Biggam told reporters.

Defense lawyers say Hayes was an eager participant that night, even using his own cell phone light to show Tichelman where to inject him. And they are adamant she then simply panicked.

"This video will show that it's an accident. Everything about this video indicates accident and panic, everything about it," Christensen told reporters.

• Who's to blame in Google exec's OD death?

For months they've investigated Forrest Hayes' past, asking prosecutors to hand over video from the "Escape's" cameras as far back as six months before he died.

"We have some indications from other material that there may have been previous encounters on the boat. It would be highly relevant in regard to whether or not there is-- drug usage along with sex," Christensen told reporters.

But at the hearing comes a bombshell. With her parents watching, [Alix Tichelman pleads guilty to involuntary manslaughter.](#)

Judge: Do you understand that when you plead no contest or guilty you're getting two felonies and five misdemeanors?

Alix Tichelman: Yes

Alix Tichelman in court on May 19, 2015.

"48 Hours"

And through her lawyer, she apologizes to the Hayes family: "It was accident and panic and she's so, so sorry for it."

Tichelman was sentenced to six years in a local jail, but with credit for her time served and a reduction by the judge, she'll likely serve just a little over two years.

After the hearing, there was another stunning development. Prosecutor Rafael Vasquez says the family of Forrest Hayes told him they never wanted Alix Tichelman charged.

"The family did not want this case to be filed, they would have been very happy if this case had been dismissed," Vasquez explained. "They were terrified about the prospect of this case going to trial."

The family, he said, did not want that video from Hayes' boat to ever be made public.

"I can only imagine what further pain, what further humiliation they would endure if that video was released out into the public," said Vasquez.

What's more, he says Alix was never a cold-blooded killer, as described by law enforcement.

"That was never depicted in that surveillance video," said Vasquez.

In fact, the prosecutor agrees with the defense attorneys that Alix was anything but callous when Forrest collapsed.

"And the fact that she made some effort to wake him up, hit him in the chest, smack him in the face, holding him up trying to lift him up, then holding him, hugging him at one point, and then you can see her crying in one instance, and then yelling for him to wake up in one instance -- that clearly showed somebody who appeared concerned at that time. And that is certainly inconsistent with somebody who acted with an obvious intent to kill," he explained.

But, the prosecutor says, what she is guilty of is not doing enough.

"She was the only one who could have rendered help and she neglected to do so, she failed to do so and instead took liberties to destroy evidence and to make her getaway while leaving the man there to die," said Vasquez.

In the end, one of Tichelman's attorneys, Athena Reis, says her time in jail has been helping turn Alix's life around.

"You know, she's clean and sober. She's closer with her family than ever, and I think she's really used this time to reflect," said Reis.

But for Forrest Hayes' family, there is no turning around. And they'll try to put the scars of his actions behind them.

"From this point on, the family no longer has to worry about the concern associated with all the scrutiny, all the ridicule and all the scorn generated by all the media attention in this case," Vasquez said. "This family has been through a lot."

Alix Tichelman is scheduled to be released from jail in June 2017. She will be 29 years old

The Dean Riopelle case is still open and under investigation.

GOOGLE EXPOSED AS EXTREMIST CULT

Google Attempt to 'Fact Check' News Results Almost Exclusively Targets Conservative Media

[Jeremie Lederman / Lederman Studio](#)

by [ALLUM BOKHARI](#) 10 Jan 2018 [1879](#)

[Analysis](#) from the Daily Caller shows that Google's new fact-checking feature, which displays 'fact-checks' next to allegedly disputed stories in search results, almost exclusively targets conservative media.

It's already been a bad week for Google: explosive information released in James Damore's [class action lawsuit](#) has revealed an atmosphere of extreme progressive bias at the company, complete with the open shaming and intimidation of [conservatives](#) and [white males](#). Now there is evidence that the company's hyper-partisan bias is trickling down into its product.

Currently, when you search for a news site, for example, 'Breitbart News,' Google will show you a list of topics that the site has focused on, as well as a tab for 'reviewed claims.' These are stories that have been reviewed by 'fact-checkers' like Snopes and Politifact.

Like Google, these so-called “impartial fact-checkers” claim to be unbiased, but have a history of partisan favoritism. Snopes, for example, is [staffed](#) with rabid anti-Trumpers, while Politifact is [funded](#) by a Clinton Foundation donor and [routinely](#) comes to empirically dubious conclusions that typically favor Democrats.

advertisement

Not all news sites have a “reviewed claims” tab under their name, however. Some just have “writes about,” with no reviewed claims. And yes, there’s a pattern. Virtually all the websites affected by Google’s “fact-checking” system are conservative or right-wing, with the exception of Upworthy and, according to the Daily Caller report, Occupy Democrats.

After playing around myself, here are the websites I found that trigger Google's fact-check feature. Almost universally conservative websites, but also white supremacists’ and Upworthy. pic.twitter.com/4KQAHmxda9

“Alex Griswold (@HashtagGriswold) [January 9, 2018](#)”

I know the liberal reaction will be "hurr durr, those sites do need fact-checking." Let's allow for that. These are the sites that DON'T trigger any sort of fact-check, and I promise you they absolutely should pic.twitter.com/Pktf8wdJ0n

â Alex Griswold (@HashtagGriswold) [January 9, 2018](#)

Among the other news sites not fact-checked by Google:

- CNN ([busted](#) for fake news about Donald Trump Jr's alleged connections to Wikileaks)
- *Rolling Stone* (their â Rape on Campusâ [story](#) is among the most significant cases of fake news in recent memory)
- NBC (known for their [fib-telling](#) anchors)
- ABC (had to [suspend](#) Brian Ross for spreading fake news)

But perhaps this isn't Google's fault. It could be the fact-checkers, right? Maybe they're just so biased, they never fact-check the left wing and mainstream media?

Wrong. Even they can't be that brazen. The really damning detail for Google is that claims made by outlets like CNN and MSNBC *have* been fact-checked before. Claims made by MSNBC's Rachel Maddow have been rated as â falseâ by Politifact on four occasions since 2010, â mostly falseâ on five occasions, and â pants on fireâ (the least truthful rating) on one. Chris Matthews has received two â falseâ ratings and one â mostly falseâ rating in the same period. CNN's Don Lemon received a â falseâ rating in 2014 for claiming he was able to â go and buy an automatic weapon.â

This meets the definition of a â reviewed claim.â Lemon made a factual claim live on CNN, it was reviewed by a third-party fact-checker, and found to be false. So why doesn't it appear under a â reviewed claimsâ tab when you Google CNN?

There's only one explanation: Google is even more biased than the fact-checkers.

Furthermore, as the Daily Caller notes, some of the â claimsâ listed by Google are misrepresentations of conservative media.

For example, Google says that Breitbart claimed an illegal alien was charged with starting a California wildfire:

What the linked story *actually* claims is that an illegal alien was *suspected* of starting a California fire. That is a completely different claim.

Combined with the information released in the Damore lawsuit, Google's brazen progressive bias has been laid bare for the world to see. And it's still only Wednesday.

Google's New Fact-Checker Is Partisan Garbage

The tech giant is dishonestly manipulating perceptions about conservative sites before people even read them.

JANUARY 10, 2018 By [David Harsanyi](#)

In the midst of the fake news hysteria last year, Google [launched](#) a project to help curate reliable information for its readers by identifying articles and sites that need fact-checking. And this may come as a surprise to some of you, but it looks like the tech giant's truth project is imbued with a tiny bit of ideological and political bias.

Eric Lieberman at The Daily Caller [recently found](#) that the fact checks displayed in Google's search engine results are targeted almost exclusively at conservative publications. You can [test it out](#) yourself.

Now, you may believe that conservatives are hopeless liars in need of relentless correcting, so I'll concede the point for argument's sake. Even then, you'd have to admit it's a small miracle that, according to Google's search engine, not a single prominent liberal or mainstream site in the entire universe has ever uttered a dubious or questionable claim.

Luckily for us, there are methods available to analyze the veracity of Google's project. One way, for example, is to take a reviewed claim made against The Federalist, the site I happen to know best, and contrast it to the coverage of other sites.

Consider the case of a woman named Eileen Wellstone. Out of many thousands of pieces published by The Federalist over the past four years, a single one mentions the name Eileen Wellstone. That article, detailing the sordid history of Bill Clinton, mentions her name exactly [once](#): "Another woman, Eileen Wellstone, claimed Clinton raped her while he was at Oxford University in the late 1960s."

For some reason, in this reviewed claim against The Federalist, Google sends the reader to a Snopes fact-check that [argues](#) that Clinton wasn't expelled from Oxford over this alleged rape—a point I concede sounds completely accurate and is also an assertion that no one has ever made in this publication.

So the question is, does Google tag every article that relays accusations of sexual misconduct or rape as "unproven," or just the ones against Bill Clinton? Or is the mention of Wellstone specifically worthy of a claim? The Wellstone case has not only been cited in all types of publications (and not in efforts to debunk it, either; [1,2,3,4,5](#), and so on) but by *The Washington Post*'s [own fact-checker](#).

In a 2016 article detailing allegations against Bill Clinton that might be brought up by then-candidate Donald Trump, *WaPo* notes, "Eileen Wellstone says she was assaulted by Clinton when he was a student at Oxford University in 1969." There is virtually no difference between that statement and the one published in The Federalist. Not that Google search engines users would know this when they search for the influential newspaper.

Or take another purported fact-check regarding climate change, which creates the impression that there's something inaccurate about a specific arguable claim because the larger notions about the topic happen to be true.

What's most amusing about this fact-check is that Google sends people who searched for "The Federalist" to an article correcting a claim made by someone *on CNN*, an outlet that, somehow, even though they apparently feature contributors who make questionable claims about science, is spared from search-engine truth-police grilling.

Moreover, the quote featured in the "reviewed claim" section is not even in The Federalist article. Google's go-to site, Climate Feedback, an ideologically motivated site itself, [argues](#) that "Observed warming since the 1970s is consistent with climate model projections." This is at the very least an arguable contention. Feel free to use your Google search engine to find thousands of pieces debating the accuracy modeling over the decades. This seems to be a normal, appropriate, and completely scientific debate to be engaged in.

More importantly, the article's position is that the "alarmist" partisans cherry-pick projections hoping to scaremonger voters into making political decisions. That doesn't necessarily mean that climate change isn't happening. Then again, once you begin reading [through the fact-check](#), you'll quickly notice that it's not really debunking The Federalist's assertion at all (The Federalist is once again never even mentioned in the fact-check that allegedly debunks The Federalist); the participants are simply claiming that models, in general, have been correct that it's getting hotter overall "which does not conflict with anything the article contends."

But if it rings true, it is true, I guess.

In theory, opinion sites will offer more speculation about what events and policy mean. These claims are prone to be challenged, and they should be. That's part of our discourse. But as Lieberman points out, the Google fact-checking itself is often unconvincing and offered by biased sources.

Take the other unproven charge against The Federalist. This one, [also by Snopes](#), claims to debunk an article that argues that vandals burned down a century-old bust of Abraham Lincoln in Chicago in broader protests about Confederate statues. Again, that wasn't what the article argued. [It argued](#) that the vandalism a term used by an alderman in Chicago, as well as was part of a broader effort to tear down history and monuments. Since a number of statues, including the Lincoln Memorial in Washington, had also been vandalized right around the same time, it's certainly not out of bounds for a columnist to treat these incidents as a trend.

But if this is the standard for corrections and dissuading people from visiting a site, what possible reason could there be for left-wing sites that regularly make arguable or false assertions about economics, history, science, and politics, like Vox and ThinkProgress and many others, to be spared from this fact-checking? It's one thing for us to read publications through filters. We do it all the time. But it's another for a search engine to manipulate perceptions about those sites and only conservative ones before people even read them.

GOOGLE EXPOSED AS POLITICAL SCAM OPERATION

Google internal corporate policy documents exposed which reveal its internal commitment to radical intersectional leftism, according to a major [report](#) by NBC News.

The NBC report, an in-depth feature that drew on comments from current Google employees, pointed to Breitbart News's exposés on the company's internal culture, which is highly biased against white males, as one of the reasons for the tech giant's shift:

The right-wing news website Breitbart began covering the internal tensions about Google's efforts to become more diverse, publishing [a July 2018 article](#) on a speaker event hosted by Google on the topic of how white people can better navigate conversations about

racism and privilege in the workplace. Breitbart [accused](#) Google of breaking its [internal policy](#) against using blanket statements about categories of people, such as about employees in certain racial groups.

â There was a meme going around that said white fragility shuts down discussions of white fragility,â a person involved with the event said in an interview, referring to a meme that circulated on an internal employee message board. The event wasnâ t ultimately shut down, but additional security was provided.

Read the full report at [NBC](#).

Radical intersectional leftism, an ideology often characterized by the the use of demeaning language (â white fragilityâ) against white males, is typically introduced into corporations like Google under the banner of â diversity and inclusion,â whereby discrimination and hostility against certain groups is excused on the basis of creating an â inclusiveâ culture for women and minorities.

According to the NBC report, fear of further lawsuits similar to James Damoreâ s class-action case against the tech giant, which alleged that it discriminates on the basis of race and gender as well as political viewpoint, was another factor causing the company to scale back its internal â inclusionâ efforts.

As Breitbart News reported in 2018, the Damore case [revealed](#) numerous instances of rampant anti-white, anti-male sentiments in Googleâ s workforce in the runup to Damoreâ s firing (Damore was fired after he circulated a memo calling for more viewpoint diversity at the company).

One comment made by a then manager-level employee, Liz Fong-Jones in 2015 released via the lawsuit reads â I could care less about being â unfairâ to white men. You already have all the advantages in the world.â

In another 2015 post released via the lawsuit, then manager-level employee Kim Burchett shared an article challenging people to â stop reading white, straight, cis male authors for one year.â

The lawsuit also revealed a [document](#) that was circulated to managers at the company, advising them that values like â objectivity,â â individual achievement,â and â perfectionismâ were examples of â U.S. white male dominant culture.â

Melanie Parker, Googleâ s â Chief Diversity Officer,â denied that the company is scaling back its diversity efforts. In a comment to NBC, she said the company is â maturing our programs to make sure weâ re building our capability.â Parker cited the companyâ s new â racial equity trainingâ course, which was launched recently.

However, NBC cites a source at Google who says that one senior employee in the AI unit told her that â conversations about diversity could become a liability.â

Another Google employeeâ s statements to NBC indicate that some of Googleâ s changes were merely cosmetic, for example referring to diversity and inclusion by the acronym â D&Iâ instead of saying the word â diversity.â

Are you an insider at Google, Facebook, Twitter, or any other tech company who wants to confidentially reveal wrongdoing or political bias at your company? Reach out to Allum Bokhari at his secure email address allumbokhari@protonmail.com.

GOOGLE EXPOSED!!!!

Dear Senator Nunes:

Here are the bullet points for the supplied disclosure materials -

- While Facebook has consumed recent information manipulation scandal head-lines, the illicit activities behind Google make Facebook pale in comparison.
- Tens of thousands of news articles and federal reports confirm that Google receives a very large sum of assets and cash from the intelligence community monthly.
- While Google pitched the government on Google's ability to *help catch bad guys*, that is, in fact not what Google is doing with the money. Almost every attempt to use Google technology at the CIA, DIA and NSA has resulted in either 1.) spectacular failure or 2.) wild goose chases.
- Google operates one of the largest *Pass-Along Payola* scams ever deployed. In this scam 1.) Taxpayer money from The Treasury is, 2.) ...Given to crony corruption insider Google, 3.) ...Who then conduits the money, as covert campaign funds, to the corrupt political officials who got Google the government deals in the first place.
- The Google *Pass-Along Payola* scam is endless, getting bigger and requires Congressional action to break the chain.
- Google has paid off SEC, CFTC, FCC and FTC officials for protection.
- There are over 100 ex-Google employees and deeply credentialed experts who can testify to these facts but they have been blockaded, by Google lobbyists and dirty politicians, from public testimony.
- For example, Dr. Robert Epstein, James Damore, Ronald Robertson, Laura Ingraham and a host of others, have publicly offered hard facts proving the assertions herein but they have never been interviewed by Congressional staff in an office not under

surveillance or in a live televised Congressional hearing. A full disclosure of what these â€œ over 100â€œ people know would put Google out-of-business rather quickly.

- Google pitched government officials about their ability to â€œ **...start and operate a political revolution in any venue, domestic or overseas, cause members of the public to become angry enough to kill targeted other members of the public and create and operate these effects in an undetectable manner using subliminal psychological manipulation tricks amplified by Googleâ€™s control of the internet connected to the mass population...**â€œ . This means that Google has admitted to rigging elections and politics.

- While that service premise may cause concern at first read, what should cause even more concern are the dossiers and psychological profiles of Googleâ€™s Eric Schmidt, Larry Page, Jared Cohen, and Sergy Brin. Their deeply emotional involvement in their shared personal politics combined with their utter disregard for the law makes one wonder about how far they will go in their â€œ means justifies the endsâ€œ cult like devotion to â€œ The Google Processâ€œ .

- With an extremist culture, filtered HR programs that seek '**like minded employees**', a willingness to discuss the need for "coup d-eta's, an endless supply of government cash and an ownership bent on total political control of their singular ideology, should this not cause concern?'

- Google used these tactics and technologies to place Barack Obama in the White House. That is why the Obama White House was so deeply staffed by Google employees and executives. Senior FBI and CIA officials, like Comey and Brennan, knew of this and covered it up.

- If you look on PACER.GOV you will see that Google has an extraordinary number of lawsuits filed against it for stealing the technology of others. Many of these lawsuits refer to Google as a racketeering "cartel". Google has no concern for the law, business ethics or the rights of others. The Google cartel owns hundreds of front operations disguised under different high tech names.

- A fictional mega spy database called 'The Beast' is often referred to in TV shows but a version of 'The Beast' actually exists. Google formed it to exchange privacy abused user data with Amazon, Linkedin, Facebook, Twitter, Snapchat, Taleo, Axcion, etc. for election manipulation purposes.

- 90% of the employees at Google are oblivious to, and hidden from, the machinations of Googleâ€™s owners. They are solicited by the cult of Google with free food, â€œ coolnessâ€œ , gadgets and a programmed echo-chamber cult-like HR process which requires â€œ mindfulness trainingâ€œ and â€œ Community organizingâ€œ outreach. Google is more Rajneesh and Scientology than they are science. The DOJ Cult Intervention Team should be deeply examining the abuse of young Millennial Google employees

- The most critically important point and the key take-away here is this: **Google bosses have built a system to subliminally control the impressions of the public, spy on the public for political control and operate a self-sustaining government payola scam and they do this with impunity, zero monitoring and in one of the grossest violations of morality and human rights ever conceived.**

- The next most critical take-away here is: **If you are an average person, it is technically nearly impossible for you to comprehend or notice what the crimes are that Google is doing. That is the magic of their scheme.**

- We swear, warrant and certify that these facts are true and accurate and will so testify before Congress with proper witness protection and legal resources!

Draft 2.1

Since 2012, Dr. Epstein has been studying and writing about some of the most challenging issues facing the world in the Internet age:

On the topic of privacy, his initial research suggests that Internet users are divulging nearly 40 percent more personal information online than they would if knew more about how that information might be used. He and collaborator Ronald Robertson have found that the typical "Terms of Service" (TOS) warning has no impact on behavior and therefore is useless as a warning. Adding a requirement that people click to acknowledge the TOS message creates a deterrent effect; adding a strong, explicit warning to the TOS message increases the effectiveness of the deterrent.

Regarding elections, Epstein and Robertson have found in multiple studies that search rankings that favor a political candidate drive the votes of undecided voters toward that candidate, an effect they call SEME ("seem"), the Search Engine Manipulation Effect. As a result, Dr. Epstein has called for the regulation and monitoring of search engines. Without equal-time rules of the sort that protect political candidates in other media domains, he says, biased search rankings exercise undue influence over voter's opinions - influence that cannot be counteracted by individual candidates but that can easily determine who will win a close election.

Epstein and Robertson's landmark report about SEME, published in the Proceedings of the National Academy of Sciences (PNAS) in 2015, can be downloaded [here](#). As of

January 2018, it had been downloaded more than 90,000 times from PNAS's website and was ranked by PNAS to be in the top 1 percent of all reports the organization monitored in all the sciences.

Dr. Epstein's Politico essay, "[How Google Could Rig the 2016 Election](#)," can be downloaded [here](#). Dr. Epstein's preview of his upcoming book, "[The New Mind Control](#)," published in Aeon magazine - which has been viewed more than 250,000 times - can be downloaded [here](#).

To view Dr. Epstein talking about SEME on the Larry King Show, click [here](#). To view a comedy sketch about SEME on the RT network, click [here](#).

Dr. Epstein also recently discovered a simple yet powerful way that search suggestions can be used to shift opinions and votes, an effect he calls the Search Suggestion Effect (SSE). An initial report about his research on this topic can be viewed [here](#).

In a series of articles in distinguished publications - "[Google's Dance](#)" (TIME), "[Google's Gotcha](#)" (U.S. News & World Report), "[Google's Snoops](#)" (Dissent), "[The New Censorship](#)" (U.S. News & World Report), and other essays - Dr. Epstein has also been critical of various aspects of the operations and business model of Google, Inc., which he says pose a serious threat to civil liberties.

Facebook deceived users about the way it used phone numbers, facial recognition, FTC to allege in complaint

(Richard Drew/AP)

By [Tony Romm](#)

The Federal Trade Commission plans to allege that Facebook misled users about its handling of their phone numbers as part of a wide-ranging complaint that accompanies a settlement ending the government's privacy probe, according to two people familiar with the matter.

In the complaint, which has not yet been released, federal regulators take issue with Facebook's earlier implementation of a security feature called two-factor authentication. It allows users to request a one-time password, sent by text message, each time they log on to the social-networking site.

But some advertisers managed to target Facebook users who uploaded those contact details, perhaps without the full knowledge of those who provided them, the two sources said. The misuse of the phone numbers was first identified in media reports and by academics this year.

[\[Facebook will have to pay a record-breaking fine for violating users' privacy. But the FTC wanted more.\]](#)

The FTC also plans to allege that Facebook had provided insufficient information to users — roughly 30 million — about their ability to turn off a tool that would identify and offer tag suggestions for photos, the sources added. The sources spoke on the condition of anonymity. The facial recognition issue appears to have first been publicized earlier this year by [Consumer Reports](#).

The FTC declined comment. Facebook also declined to comment.

The two privacy violations are included in a complaint tied to a settlement brokered between the FTC and Facebook, which multiple sources said they expect to be announced Wednesday. The agreement requires Facebook to submit to unprecedented federal oversight of its business practices, as The Post [first reported in May](#), including the creation of a special committee on its board of directors that regularly certifies the tech giant is handling user data appropriately.

But the inclusion of those two privacy issues in the complaint highlights a critical question facing the commission: How to handle a litany of privacy scandals that came to light during the course of the FTC's 16-month investigation into Facebook, and whether the FTC will penalize the tech giant for those additional violations or give it a clean slate going forward.

As part of the settlement, Facebook won't be required to admit guilt, according to three people familiar with the matter. The FTC often allows companies to avoid admitting any wrongdoing as part of its agreements ending investigations, choosing instead to focus its legal firepower on securing substantial changes to an offending company's business practices. But the move could embolden critics who feel the agency was not aggressive enough in its negotiations with Facebook.

There's a growing perception that the perceived effectiveness of what the agency's doing depends on [its] ability to extract this kind of acknowledgment of fault," said William Kovacic, a former FTC commissioner who's now a professor at the George Washington University Law School.

Google avoided a statement of guilt when it was penalized by the FTC in 2012 for its privacy violations as part of an agreement with the agency that saw the tech giant pay a \$22.5 million fine. On Monday, [Equifax](#) also did not admit guilt to the FTC even as it committed to the agency to improve its cybersecurity practices. The credit-reporting agency drew the FTC's attention after it suffered a massive security breach in 2017 that put 147 million Americans' personal data in jeopardy.

Adding to some critics' potential objections: The FTC did not question Facebook chief executive Mark Zuckerberg, two people familiar with the probe said Tuesday.

The settlement is [weaker than the tough penalties](#) including a fine into the tens of billions of dollars that some at the FTC initially hoped to obtain from Facebook, sources told the Post over the course of a six-month investigation. Those issues prompted the FTC's two Democrats to vote against the settlement in July.

GOOGLE FOUND TO MANUALLY MANIPULATE THE ENTIRE INTERNET FOR GOOGLE OWNERS PERSONAL RELIGIOUS AND POLITICAL VIEWS

REVEALED: Two More Google Blacklists Designed To Remove âFringe Domainsâ And Op-Eds From Special Search Results

| Tech

J. Arthur Bloom | Deputy Editor

At least two other blacklists are applied to Googleâs web answers feature, one of which is manually edited, documents obtained by The Daily Caller indicate.

The first blacklist, titled âwebanswers_url_blacklist,â impacts the companyâs âfeatured snippetsâ or answer blocks, the type of special search result that appears when questions are typed into the search bar. For example, the question âWhat is the biggest fish?â yields a special search box on the whale shark. [\(EXCLUSIVE: Documents Detailing Googleâs âNews Blacklistâ Show Manual Manipulation Of Special Search Results\)](#)

In screenshots of the blacklist shared with The Daily Caller, the instructions at the top of the page say, âTo ensure the blacklist will REMOVE a URL, add a line â# REMOVE urlâ .â And, âTo ensure the blacklist WONâT remove a URL by accident, add â# PERMIT urlâ ,â indicating that the blacklist is manually edited.

One of the blacklisted results was a Washington Post [op-ed](#) titled, âHow Vladimir Putin Became The Worldâs Favorite Dictator,â which the algorithm pulled in response to the query âwho is the dictator of Russia.â

In one of the changelogs for the web answers blacklist, a Googler alludes to the blacklisting of all opinion content for web answers.

âWe are going to be removing opinion docs from all of newsey/political/sensitive webanswers. So, BLing any document that we consider to be clearly opinion is not an issue,â the note says.

NEW YORK, NY â JUNE 3: The Google logo adorns the outside of their NYC office Google Building 8510 at 85 10th Ave on June 3, 2019 in New York City. Shares of Google parent company Alphabet were down over six percent on Monday, following news reports that the U.S. Department of Justice is preparing to launch an anti-trust investigation aimed at Google. (Photo by Drew Angerer/Getty Images)

âFeatured snippets are a feature within Search that highlights web sources that are likely to contain what youâre looking for,â a spokesperson for Google told The Daily Caller. âDue to the special formatting they receive, we have policies that prevent us from showing a featured snippet for topics like civics or medical information where the content lacks broad consensus. Our systems are designed to not show featured snippets that would violate our policies, and we take action if violating snippets still appear. These policies and actions have no impact on how a page ranks in organic search listings.â

According to Google, they are working on developing ways to ensure that algorithms are weeding out inappropriate web answers rather than having to do so manually. The second web answers blacklist, called `all_fringe_domains`, appears to be an example of this, as it seems to be generated by an algorithm.

A portion of the fringe domains list was shared with The Daily Caller. On it are the American Spectator, Breitbart, Breaking911, the website of pastor Brian Jones, the website of [Bring Your Bible to School Day](#), Consortium News (published by Robert Parry), St. Philip the Deacon Lutheran Church, speakerryan.com, The Franklin Society (a cryptocurrency blog), Free Thought Project, The Gateway Pundit, and The Gorka Briefing.

In addition, several blogs critical of conservatives are on the fringe domains blacklist, including Breitbart Unmasked and Spencer Watch, a blog critical of Jihad Watch's Robert Spencer.

Google CEO Sundar Pichai told Congress in December that the company does not manually intervene on any particular search result. [\(RELATED: Google Fires Republican Engineer Who Spoke Out Against an Outrage Mob\)](#)

But in fact Google does manually intervene in several different types of special search results, as The Daily Caller [revealed](#) in April, through their news blacklist. The web answers blacklist is more evidence that they do manually intervene in particular search results.

Pichai also said in a recent interview with Axios that the company wants to really prevent borderline content, content which doesn't exactly violate policies.

Google is facing pressure from both the Republican administration and the Democrat-controlled House, with a Department of Justice antitrust probe and a new [set of hearings](#) in Congress on competition in digital markets.

In Mountain View California at Google HQ, it is lonely except for all but the hired Google shills...

Google hires Rent-A-Crowd fake protesters and blogger trolls hired by Google and George Soros to act as if they were "Pro-Google".

THE GOOGLE GLOBAL DECADE OF PROTEST IS NOT CANCELLED OR DELAYED IT IS HAPPENING ON-LINE, AROUND THE WORLD

- 1.) WRITE EVERY PERSON AND ADDRESS AT GOOGLE AND TELL THEM WHAT YOU THINK OF THEM.
- 2.) WRITE EVERY REPORTER AND NEWS OUTLET YOU KNOW OF AND DEMAND THAT THEY DISCLOSE GOOGLE'S CORRUPTION.
3. WRITE EVERY PERSON YOU KNOW WITH A YOUTUBE ACCOUNT OR GMAIL ACCOUNT AND ASK THEM TO CANCEL IT AND MOVE TO A NON-CORRUPT SERVICE.

Protest Google Censorship, Decry Google's Promotion of Violence, Protest Google Election Rigging, Protest Google's Abuse Of Women and Blacks, Protest Google's Spying On The Public, Protest Google's Bribery Of Public Officials, Protest Google's Tax Evasion

YOU KNOW THAT GOOGLE IS A CORRUPT AND EVIL OPERATION

DEMAND THAT THE GOVERNMENT SUE GOOGLE FOR CRIMINAL RICO VIOLATIONS AGAINST THE PUBLIC!

BANKRUPT AND TERMINATE THE VERY EVIL GOOGLE!

Image Credits: [Christophe Morin/IP3 / Getty](#).

Google's staff are revealing the truth about Google's fascist company: software engineer James Damore, whose [manifesto](#) entitled ["Google's Ideological Echo Chamber"](#) questioned Google's politically correct corporate culture. Damore charged was determined to ["perpetuate gender stereotypes"](#) by advancing specious arguments to rationalize the gender gap reality that a relatively low number of women are advanced to high-paying technical positions in Google's corporate hierarchy.

On April 17, Infowars.com [reported](#) that since 2006 three entities — Google, George Soros's Open Society Institution and the Ford Foundation — have contributed more than \$72 million to non-profit leftist organizations that have been most active in promoting the idea the Internet needs to be regulated by the government as a "common carrier" public utility under Title II of the Communications Act — the same regulatory framework crafted some 80 years ago to regulate the old rotary phone system.

Infowars.com has [previously warned](#) that Google and the largest communications giants on the Internet lobbied the federal government to define broadband under these 1930s-style regulations — a designation that would allow the government to regulate more rigorously the broadband providers that built the core network connecting users to the Internet as "common carriers."

The deceptively-termed "net neutrality" strategy was designed to exempt content monopolies like Google and Facebook from the strict regulations the FCC would apply to common carriers — a scheme that would allow Google, Facebook and the other Internet portal giants to censor conservatives as "fake news," while demanding that "common carriers" like AT&T and Verizon have no choice but to carry their censored content.

The implementation of these 2015 Obama-era "net neutrality" regulations, which were heavily pushed by Google in hundreds of closed-door meetings at the Obama White House, carved out Google and the other Silicon Valley behemoths, and secured their position as absolute information gatekeepers.

Since these 2015 regulations passed, Google and Facebook have moved to become the judge, jury and executioner of the content we read on the Internet, under the guise of eliminating "fake news."

GOOGLE IS A COVERT PAC COMMITTEE! Fired by Google, a Republican Engineer Hits Back

Search giant's culture wars flame anew; a senior executive contacts law enforcement over leaks

Kevin Cernekee says he was fired by Google last year for being an outspoken conservative on the company's freewheeling internal message boards. Jason Henry for The Wall Street Journal

By

Rob Copeland

MOUNTAIN VIEW, Calif. — Kevin Cernekee was still a Noogler — a Google's term for a new employee — when his conservative take on political and social issues raised hackles within the search giant.

After several posts on the company's freewheeling internal message boards in early 2015 rankled some colleagues, he was given an official warning from human resources about conduct deemed disrespectful and insubordinate. Around that time, a senior manager wrote on the boards that he added Mr. Cernekee to a written blacklist of employees he wouldn't work with.

Mr. Cernekee, 41 years old, spent much of the next three years battling Google over his perceived violations, and pressing his contention that right-leaning employees were being treated unfairly, according to interviews, documents and copies of posts on Google's internal message boards. In one example from 2017 that he reported to human resources, a manager publicly asked on a board about employees holding views like Mr. Cernekee's: "Can't we just fire the poisonous assholes already?"

In June 2018, Mr. Cernekee was fired.

Google told Mr. Cernekee in a termination letter that he was let go for misuse of equipment including its remote-access software system. Mr. Cernekee, who hasn't spoken publicly before about his status at Google, denies that. He says he was fired for being an outspoken conservative in famously liberal Silicon Valley.

"Historically, there's been a lot of bullying at Google," Mr. Cernekee says. "There's a big political angle, and they treat the two sides very differently."

A Google spokeswoman, Jenn Kaiser, declined to comment on the specific incidents described in this article involving Mr. Cernekee and other employees. "We enforce our workplace policies without regard to political viewpoint," Ms. Kaiser said in a statement.

Political bias in the technology world is a headline topic in Washington, D.C., where Republicans on Capitol Hill and the Trump administration are increasingly ramping up heat on [Alphabet Inc.](#) [GOOG +0.52%](#) as Google and other tech platforms over perceived bias against conservatives. Google's global policy chief testified in July to Congress that political leanings don't factor into the company's decision making.

Mr. Cernekee's allegations also highlight Google's mounting struggle to rein in its fractious workplace, which has [long been a place of debate](#) over free expression. The company historically has tolerated, and even

encouraged, argument on hot-button issues. Employees globally walked out last year to protest multimillion-dollar exit packages for executives accused of sexual misconduct, and Google subsequently changed some of its conduct policies.

Google has long promoted an open corporate culture, including message boards in which employees across the world share opinions on both business and personal topics.

Kent Walker, Google's chief legal officer. Photo: aaron bernstein/Reuters

Recently, though, it has taken steps to put limits around certain employee behavior. Chief Legal Officer Kent Walker has threatened to fire workers poking around inside the company for information on contentious topics like Google's cloud-computing relationship with the U.S. Defense Department, people familiar with the matter say. Mr. Walker wrote to staff in May, "more than ever, we need to take good care of the information we hold."

In a mid-July memo widely distributed to staff, Google said it had contacted law enforcement about an employee who released unspecified confidential information externally. The email reminded staffers to flag suspected behavior to its "Stop Leaks" team.

"Lively debate is a hallmark of Google's workplace culture," Ms. Kaiser said.

Google employees across the political spectrum say rancor has risen since the 2016 election. Conservative staff started an affinity group where workers must apply to be let in. Liberal sympathizers of Google's employee walkout separately founded their own closed group, dubbed "transparency and ethics." A group called "free speech" is little used, employees say, as the term becomes more charged.

In July, a white YouTube employee, Christopher Cukor, was filmed calling the police on a black man he suspected of breaking into his San Francisco apartment building. Mr. Cukor later apologized after it turned out the man was visiting a friend. Google owns YouTube.

In the aftermath, some Google and YouTube employees wrote on internal message boards that Mr. Cukor's presence made them feel unsafe, and that they would refuse to work with him, several people familiar with the matter said. Mr. Cukor wrote in a blog post that his father had been murdered by a trespasser outside his home.

Last week, a senior Google engineer, Gregory Coppola, gave interviews to a pair of conservative media outlets and suggested the company was politically biased toward the left. Hours later, he received a call from human resources putting him on administrative leave and disabling his access to internal systems, according to a person familiar with the matter.

The walkout organizers, who lean left, also have complaints. They say the company retaliated against them because of their activism. Former YouTube marketing manager Claire Stapleton says she was "branded with a scarlet letter" and demoted because of her outspokenness. Google says it investigated her claims and found them false. Ms. Stapleton quit in June with a severance package, she says.

Mr. Cernekee didn't receive a payout. A Chicago-area native, he is in some ways the prototypical Silicon Valley engineer. He repairs old computer equipment in his spare time and bikes on the weekends.

Mr. Cernekee, recently standing outside the Googleplex in Mountain View, Calif., describes himself as a mainstream Republican who supports President Trump. Photo: Jason Henry for The Wall Street Journal

His political stances, however, are outliers. Some 95% of Google employee donations to candidates in the

2018 midterm elections went to Democrats, according to the Center for Responsive Politics, citing public disclosures.

Before moving to the Bay Area in 2015 to work on Google's laptop lines, Mr. Cernekee says, the region's dominant liberalism struck him as "just like something to occasionally read online and laugh at. At Google, I jumped right into the middle of it, where, holy crap, these people actually exist."

Share Your Thoughts

Have you ever voiced political opinions at work? What happened as a result? Join the conversation below.

Early on, he stood up for a colleague who publicly suggested that Google not consider race or gender in hiring decisions. "A bunch of people jumped on him and started cussing him out and calling him names," Mr. Cernekee says. "And then his manager showed up in the thread and denounced him in public. I was very disturbed by that."

In other posts from 2015, some of which were later cited by the company in a warning letter, he criticized a self-described feminist colleague on an internal message board, suggesting she should be more resilient to criticism. In another thread, he suggested the company add a clear statement of banned opinions to the employee handbook so conservative employees would know where the lines were drawn.

In July 2017, Google software engineer James Damore posted an internal memo suggesting that men were biologically better suited for tech jobs than women. Mr. Cernekee, who says he doesn't share that view, offered to buy Mr. Damore lunch out of curiosity.

The two were splitting a thin-crust supreme pizza when Mr. Cernekee's phone buzzed with a news alert that Mr. Damore's memo had been leaked publicly. Within a week, [Mr. Damore was fired](#). Mr. Damore is currently in arbitration with Google over his termination.

At the time, CEO Sundar Pichai publicly denounced Mr. Damore's views. To suggest that "colleagues have traits that make them less biologically suited to that work is offensive and not OK," Mr. Pichai said in an email to employees.

Mr. Cernekee also crossed with Republicans internally. One fellow engineer active in the company's conservative circles, Michael Wacker, internally circulated a dossier describing Mr. Cernekee as "the face of the alt-right" at Google. Mr. Cernekee rejects the label. He says he disagrees with alt-right philosophy, which promotes white nationalism, and considers himself a mainstream Republican who supports President Trump. Mr. Wacker was separately fired this spring; he says Google human resources warned him his behavior was "rude and dishonest."

Conservative employees say they've tried to raise concerns about unfair treatment to top Google executives at the company's weekly all-hands meetings, but their queries haven't made it through because questions must be voted up by a large number of employees to be heard.

Mr. Cernekee calls himself a whistleblower and has filed complaints with the National Labor Relations Board. Several were denied; the original is pending. He's submitted materials including a human resources warning letter that says he violated the "Respect Each Other" section of the company's code of conduct.

Among the posts cited was one in which he wrote that "many Googlers strongly disagree with Social Justice theory and even more Googlers are concerned about the internet mob's shaming and intimidation tactics employed in support of this agenda." The human resources executive wrote: "Many

Googlers were offended by your comments.â Human resources flagged one such comment in which Mr. Cernekee described himself as a second-class citizen, saying Googleâs conduct policy bans â unbusinesslike behavior.â

The NLRB declined to comment.

Mr. Cernekee says he has spent more than \$100,000 on legal fees. He now works for another technology company.

â I very much regret joining Google,â he says. â I figured it would be a good place to see intelligent arguments through. It didnât really turn out how I expected.â

Why, And How, We Are Erasing Google From The Face Of The Earth

Why they are being destroyed:

1. Google is a criminal and we know it from insider knowledge.

2. Google put a hit job on us, and others, and refused to pay for our damages they caused

Huge Covert Inside-Google Teams Engaged in Manual Interventions on Google Search Results To Rig Elections And Stock Market Results

- The Google empire controls most of the media on Earth, via many front corporations, and indoctrinates everyone in it's organization using 'cult' methodologies. Google owner's believe in "our-ideology-at-any-cost" and "the-ends-justify-the-means" scenarios. What could possibly go wrong?

- EYE-WITNESS GOOGLE STAFF AND PARTNER RECORDINGS AND TESTIMONY PROVE THAT GOOGLE IS A CRIMINAL INFORMATION MANIPULATION, STOCK MARKET-RIGGING, TAX-EVASION MONOPOLY THAT BRIBES CONGRESS

- ERIC SCHMIDT, DAVID DRUMMOND, JARED COHEN AND LARRY PAGE AT GOOGLE HAVE THIS THEORY THAT "STARTING CIVIL WARS IS GOOD FOR A SOCIETY..." SO THEY USE GOOGLE TO CREATE CULTURAL SPLITS. OTHERS MIGHT CALL THAT "TREASON".

- GOOGLE BOSSES, INCLUDING ERIC SCHMIDT, TOLD ASSOCIATES: "OBAMA NEVER WOULD HAVE BEEN ELECTED WITHOUT GOOGLE'S DIGITAL MASS PERCEPTION-MANIPULATION AND OPINION-STEERING TECHNOLOGIES..." SEE MORE AT: <https://www.thecreepylines.com>

Forensic Proof That Google Is A Cult:

Google was created to become the best-of-the-best, in mind-control, for social and political manipulation.

Steven Hassan, renown cult interdiction specialist and the author of "Combating Cult Mind Control" says: *"...there are universal patterns of manipulation; someone who's skilled (ie: Google) can figure out how to systematically and incrementally manipulate you into a vulnerable isolated place (like you computer screen) and start to control your information, control your behavior, control your thinking...to make you dependent and obedient. There are millions of people in mind control cults like this..."*

The biggest lie ever told is the one that you tell yourself when you say that *"subliminal messages and digital mind control have no effect on you"*. They do! The more you deny it, the better it works on you.

The young employees of Google are chosen for their naive and impressionable characteristics and then, as with Facebook, immersed in a synthetic bubble of ideological echo-chambering in order to push the precepts of the "Google Youth".

Google has a huge teams working on manual interventions in search results, an apparent contradiction of sworn testimony made to Congress by CEO Sundar Pichai, according to an internal post [leaked](#) to Breitbart News.

There are subjects that are prone to hyperbolic content, misleading information, and offensive content," said Daniel Aaronson, a member of Google's Trust & Safety team.

Now, these words are highly subjective and no one denies that. But we can all agree generally, lines exist in many cultures about what is clearly okay vs. what is not okay.

Breitbart TV

In extreme cases where we need to act quickly on something that is so obviously not okay, the reactive/manual approach is sometimes necessary.

The comments came to light in a leaked internal discussion thread, started by a Google employee who noticed that the company had recently changed search results for "abortion" on its YouTube video platform, a change which caused pro-life videos to largely disappear from the top ten results.

In addition to the manual approach, Aaronson explained that Google also trained automated classifiers, algorithms or scalable solutions that corrects problems in search results.

Aaronson listed three areas where either manual interventions or classifier changes might take place: organic search ("The bar for changing classifiers or manual actions on span in organic search is *extremely* high"), YouTube, Google Home, and Google Assistant.

Aaronson's post also reveals that there is very little transparency around decisions to adjust classifiers or manually correct controversial search results, even internally. Aaronson compared Google's decision-making process in this regard to a closely-guarded Pepsi Formula.

These comments, part of a longer post copied below, seem to contradict Google CEO Sundar Pichai's sworn congressional testimony that his company [does not manually intervene on any particular search result.](#)

According to an [internal discussion thread](#) leaked to Breitbart News by a source within the company, a Google employee took issue with Pichai's remarks, stating that it "seems like we are pretty eager to cater our search results to the social and political agenda of left-wing journalists."

According to the posts leaked by the source, revealed that YouTube, a Google subsidiary, manually intervened on search results related to "abortion" and "abortions." The intervention caused pro-life videos to disappear from the top ten search results for those terms, where they had previously been featured prominently. The posts also show YouTube intervened on search results related to progressive activist David Hogg and Democrat politician Maxine Waters.

In a comment to Breitbart News, a Google spokeswoman also insisted that "Google has never manipulated or modified the search results or content in any of its products to promote a particular political ideology."

Pichai might claim that he was just talking about Google, not YouTube, which was the focus of the leaked discussion thread. But Aaronson's post extends to Google's other products: organic search, Google Home, and Google Assistant.

Aaronson is also clear that the manipulation of the search results that are prone to abuse/controversial content is not a small affair, but are the responsibility of huge teams within Google.

These lines are very difficult and can be very blurry, we are all well aware of this. So we've got huge teams that stay cognizant of these facts when we're crafting policies considering classifier changes, or reacting with manual actions

If Google has huge teams that sometimes manually intervene on search results, it's scarcely plausible to argue that Pichai might not know about them.

Aaronson's full post is copied below:

I work in Trust and Safety and while I have no particular input as to exactly what's happening for YT I can try to explain why you'd have this kind of list and why people are finding lists like these on Code Search.

When dealing with abuse/controversial content on various mediums you have several levers to deal with problems. Two prominent levers are Proactive and Reactive :

- ◆ Proactive: Usually refers to some type of algorithm/scalable solution to a general problem
 - ◇ E.g.: We don't allow straight up porn on YouTube so we create a classifier that detects porn and automatically remove or flag for review the videos the porn classifier is most certain of
- ◆ Reactive: Usually refers to a manual fix to something that has been brought to our attention that our proactive solutions don't/didn't work on and something that is clearly in the realm of bad enough to warrant a quick targeted solution (determined by pages and pages of policies worked on over many years and many teams to be fair and cover necessary scope)
 - ◇ E.g.: A website that used to be a good blog had its domain expire and was purchased/repurposed to spam Search results with autogenerated pages full of gibberish text, scraped images, and links to boost traffic to other spammy sites. It is manually actioned for violating policy
 - ◇ [These Organic Search policies and the consequences to violating them are public](#)

Manually reacting to things is not very scalable, and is not an ideal solution to most problems, so the proactive lever is really the one we all like to lean on. Ideally, our classifiers/algorithm are good at providing useful and rich results to our users while ignoring things that are not useful or not relevant. But we all know, this isn't exactly the case all the time (especially on YouTube).

From a user perspective, there are subjects that are prone to hyperbolic content, misleading information, and offensive content. Now, these words are highly subjective and no one denies that. But we can all agree generally, lines exist in many cultures about what is clearly okay vs. what is not okay. E.g. a video of a puppy playing with a toy is probably okay in almost every culture or context, even if it's not relevant to the query. But a video of someone committing suicide and begging others to follow in his/her footsteps is probably on the other side of the line for many folks.

While my second example is technically relevant to the generic query of "suicide", that doesn't mean that this is a very useful or good video to promote on the top of results for that query. So imagine a classifier that says, for any queries on a particular text file, let's pull videos using signals that we historically understand to be strong indicators of quality (I won't go into specifics here, but those signals do exist). We're not manually curating these results, we're just saying "hey, be extra careful with results for this query because many times really bad stuff can appear and lead to a bad experience for most users". Ideally the proactive lever did this for us, but in extreme cases where we need to act quickly on something that is so obviously not okay, the reactive/manual approach is sometimes necessary. And also keep in mind, that this is different for every product. The bar for changing classifiers or manual actions on span in organic search is *extremely* high. However, the bar for things we let our Google Assistant say out loud might be a lot lower. If I search for "Jews run the banks" I'll likely find anti-semitic stuff in organic search. As a Jew, I might find some of these results offensive, but they are there for people to research and view, and I understand that this is not a reflection of Google feels about this issue. But if I ask Google assistant "Why do Jews run the banks" we wouldn't be similarly accepting if it repeated and promoted conspiracy theories that likely pop up in organic search in her smoothing voice.

Whether we agree or not, user perception of our responses, results, and answers of different products and mediums can change. And I think many people are used to the fact that organic search is a place where content should be accessible no matter how offensive it might be, however, the expectation is very different on a Google Home, a Knowledge Panel, or even YouTube.

These lines are very difficult and can be very blurry, we are all well aware of this. So we've got huge teams that stay cognizant of these facts when we're crafting policies considering classifier changes, or reacting with manual actions - these decisions are not made in a vacuum, but admittedly are also not made in a highly public forum like TGIF or IndustryInfo (as you can imagine, decisions/agreement would be hard to get in such a wide list - imagine if all your CLAs were reviewed by every engineer across Google all the time). I hope that answers some questions and gives a better layer of transparency without going into details about our "Pepsi formula".

Best,

Daniel

THE SMOKING GUN: Google Manipulated YouTube Search Results for Abortion, Maxine Waters, David Hogg In Order To Steer Politics And Stock Gains To Palo Alto Mafia and Pelosi/Feinstein Families

Alex

Wong, Win McNamee/Getty, Screenshot/YouTube

In sworn testimony, Google CEO Sundar Pichai told Congress last month that his company does not [manually intervene](#) on any particular search result. Yet an internal discussion thread leaked to Breitbart News reveals Google regularly intervenes in search results on its YouTube video platform including a recent intervention that pushed pro-life videos out of the top ten search results for abortion.

The term abortion was added to a blacklist file for controversial YouTube queries, which contains a list of search terms that the company considers sensitive. According to the leak, these include some of these search terms related to: abortion, abortions, the Irish abortion referendum, Democratic Congresswoman Maxine Waters, and anti-gun activist David Hogg.

The existence of the blacklist was revealed in an internal Google discussion thread leaked to Breitbart News by a source inside the company who wishes to remain anonymous. A partial list of blacklisted terms was also leaked to Breitbart by another Google source.

In the leaked discussion thread, a Google site reliability engineer hinted at the existence of more search blacklists, according to the source.

“We have tons of white- and blacklists that humans manually curate,” said the employee. “Hopefully this isn’t surprising or particularly controversial.”

Others were more concerned about the presence of the blacklist. According to the source, the software engineer who started the discussion called the manipulation of search results related to abortion a “smoking gun.”

The software engineer noted that the change had occurred following an [inquiry from a left-wing *Slate* journalist](#) about the prominence of pro-life videos on YouTube, and that pro-life videos were replaced with pro-abortion videos in the top ten results for the search terms following Google’s manual intervention.

“The *Slate* writer said she had complained last Friday and then saw different search results before YouTube responded to her on Monday,” wrote the employee. “And lo and behold, the [changelog] was submitted on Friday, December 14 at 3:17 PM.”

The manually downranked items included several videos from Dr. Antony Levatino, a former abortion doctor who is now a pro-life activist. Another video in the top ten featured a woman’s personal story of being pressured to have an abortion, while another featured pro-life conservative Ben Shapiro. The *Slate* journalist who complained to Google [reported](#) that these videos previously featured in the top ten, describing them in her story as “dangerous misinformation.”

Since the *Slate* journalist’s inquiry and Google’s subsequent intervention, the top search results [now](#) feature pro-abortion content from left-wing sources like BuzzFeed, Vice, CNN, and *Last Week Tonight With John Oliver*. In her [report](#), the *Slate* journalist acknowledged that the search results changed shortly after she contacted Google.

The manual adjustment of search results by a Google-owned platform contradicts a key [claim](#) made under oath by Google CEO Sundar Pichai in his congressional testimony earlier this month: that his company does not “manually intervene on any search result.”

A Google employee in the discussion thread drew attention to Pichai’s claim, noting that it “seems like we are pretty eager to cater our search results to the social and political agenda of left-wing journalists.”

One of the posts in the discussion also noted that the blacklist had previously been edited to include the search term “Maxine Waters” after a single Google employee complained the top YouTube search result for Maxine Waters was “very low quality.”

Google’s alleged intervention on behalf of a Democratic congresswoman would be further evidence of the tech giant using its resources to prop up the left. Breitbart News previously reported on leaked emails revealing the company targeted pro-Democrat demographics in its get-out-the-vote efforts in 2016.

According to the source, a software engineer in the thread also noted that “a bunch of terms related to the abortion referendum in Ireland” had been added to the blacklist “another change with potentially dramatic consequences on the national policies of a western democracy.”

youtube_controversial_query_blacklist

At least one post in the discussion thread revealed the existence of a file called `youtube_controversial_query_blacklist`, which contains a list of YouTube search terms that Google manually curates. In addition to the terms `abortion`, `abortions`, `Maxine Waters`, and search terms related to the Irish abortion referendum, a Google software engineer noted that the blacklist includes search terms related to terrorist attacks. (the posts specifically mentions that the `Strasbourg terrorist attack` as being on the list).

If you look at the other entries recently added to the youtube_controversial_query_blacklist(e.g., entries related to the Strasbourg terrorist attack), the addition of abortion seems `!out-of-place`, wrote the software engineer, according to the source.

After learning of the existence of the blacklist, Breitbart News obtained a partial screenshot of the full blacklist file from a source within Google. It reveals that the blacklist includes search terms related to both mass shootings and the progressive anti-second amendment activist David Hogg.

This suggests Google has followed the lead of Democrat politicians, who have [repeatedly pushed tech companies](#) to censor content related to the Parkland school shooting and the Parkland anti-gun activists. It's part of a popular new line of thought in the political-media establishment, [which views the public as too stupid to question conspiracy theories for themselves](#).

Here is the partial blacklist leaked to Breitbart:

- 2117 plane crash Russian
- 2118 plane crash
- 2119 an-148
- 2120 florida shooting conspiracy
- 2121 florida shooting crisis actors
- 2122 florida conspiracy
- 2123 florida false flag shooting
- 2124 florida false flag
- 2125 fake florida school shooting
- 2126 david hogg hoax
- 2127 david hogg fake
- 2128 david hogg crisis actor
- 2129 david hogg forgets lines
- 2130 david hogg forgets his lines

2131 david hogg cant remember his lines

2132 david hogg actor

2133 david hogg cant remember

2134 david hogg conspiracy

2135 david hogg exposed

2136 david hogg lines

2137 david hogg rehearsing

2120 florida shooting conspiracy

The full internal filepath of the blacklist, according to another source, is:

//depot/google3/googledata/superroot/youtube/youtube_controversial_query_blacklist

Contradictions

Responding to a request for comment, a YouTube spokeswoman said the company wants to promote “authoritative” sources in its search results, but maintained that YouTube is a “platform for free speech” that “allow[s]” both pro-life and pro-abortion content.

YouTube’s full comment:

YouTube is a platform for free speech where anyone can choose to post videos, as long as they follow our [Community Guidelines](#), which prohibit things like inciting violence and pornography. We apply these policies impartially and we allow both pro-life and pro-choice opinions. Over the last year we’ve described how we are working to [better surface news sources](#) across our site for news-related searches and topical information. We’ve improved our search and discovery algorithms, built new features that clearly label and prominently surface news sources on our homepage and search pages, and introduced information panels to help give users more authoritative sources where they can fact check information for themselves.

In the case of the “abortion” search results, YouTube’s intervention to insert “authoritative” content resulted in the downranking of pro-life videos and the elevation of pro-abortion ones.

A Google spokesperson took a tougher line than its YouTube subsidiary, stating that “Google has never manipulated or modified the search results or content in any of its products to promote a particular political ideology.”

However, in the leaked discussion thread, a member of Google’s “trust & safety” team, Daniel Aaronson, admitted that the company maintains “huge teams” that work to adjust search results for subjects that are “prone to hyperbolic content, misleading information, and offensive content” — all subjective terms that are frequently used to suppress right-leaning sources.

He also admitted that the interventions weren’t confined to YouTube — they included search results delivered via Google Assistant, Google Home, and in rare cases Google’s organic search results.

In the thread, Aaronson attempted to explain how search blacklisting worked. He claimed that highly specific searches would generate non-blacklisted results, even controversial ones. But the inclusion of highly specific terms in the YouTube blacklist, like âDavid Hogg cant remember his linesâ â the name of an actual viral video â seems to contradict this.

Aaronsonâs full post is copied below:

I work in Trust and Safety and while I have no particular input as to exactly whatâs happening for YT I can try to explain why youâd have this kind of list and why people are finding lists like these on Code Search.

When dealing with abuse/controversial content on various mediums you have several levers to deal with problems. Two prominent levers are âProactiveâ and âReactiveâ :

- ◆ Proactive: Usually refers to some type of algorithm/scalable solution to a general problem
 - ◊ E.g.: We donât allow straight up porn on YouTube so we create a classifier that detects porn and automatically remove or flag for review the videos the porn classifier is most certain of
- ◆ Reactive: Usually refers to a manual fix to something that has been brought to our attention that our proactive solutions donât/didnât work on and something that is clearly in the realm of bad enough to warrant a quick targeted solution (determined by pages and pages of policies worked on over many years and many teams to be fair and cover necessary scope)
 - ◊ E.g.: A website that used to be a good blog had itâs domain expire and was purchased/repurposed to spam Search results with autogenerated pages full of gibberish text, scraped images, and links to boost traffic to other spammy sites. It is manually actioned for violating policy

[These Organic Search policies and the consequences to violating them are public](#)

Manually reacting to things is not very scalable, and is not an ideal solution to most problems, so the proactive lever is really the one we all like to lean on. Ideally, our classifiers/algorithm are good at providing useful and rich results to our users while ignoring things that are not useful or not relevant. But we all know, this isnât exactly the case all the time (especially on YouTube).

From a user perspective, there are subjects that are prone to hyperbolic content, misleading information, and offensive content. Now, these words are highly subjective and no one denies that. But we can all agree generally, lines exist in many cultures about what is clearly okay vs. what is not okay. E.g. a video of a puppy playing with a toy is probably okay in almost every culture or context, even if itâs not relevant to the query. But a video of someone committing suicide and begging others to follow in his/her footsteps is probably on the other side of the line for many folks.

While my second example is technically relevant to the generic query of âsuicideâ, that doesnât mean that this is a very useful or good video to promote on the top of results for that query. So imagine a classifier that says, for any queries on a particular text file, letâs pull videos using signals that we historically understand to be strong indicators of quality (I wonât go into specifics here, but those signals do exist). Weâre not manually curating these results, weâre just saying âhey, be extra careful with results for this query because many times really bad stuff can appear and lead to a bad experience for most usersâ. Ideally the proactive lever did this for us, but in extreme cases where we need to act quickly

on something that is so obviously not okay, the reactive/manual approach is sometimes necessary. And also keep in mind, that this is different for every product. These lines are very difficult and can be very blurry, we are all well aware of this. So we've got huge teams that stay cognizant of these facts when we're crafting policies considering classifier changes, or reacting with manual actions - these decisions are not made in a vacuum, but admittedly are also not made in a highly public forum like TGIF or IndustryInfo (as you can imagine, decisions/agreement would be hard to get in such a wide list - imagine if all your CLAs were reviewed by every engineer across Google all the time). I hope that answers some questions and gives a better layer of transparency without going into details about our "Pepsi formula".

Best,

Daniel

The fact that Google manually curates politically contentious search results fits in with a wider pattern of political activity on the part of the tech giant.

In 2018, Breitbart News exclusively published a leaked video from the company that showed [senior management in dismay at Trump's election victory](#), and pledging to use the company's power to make his populist movement a [hiccup in history](#).

Breitbart also leaked [The Good Censor](#), an internal research document from Google that admits the tech giant is engaged in the censorship of its own products, partly in response to political events.

Another leak revealed that employees within the company, including Google's current director of Trust and Safety, [tried to kick Breitbart News off Google's market-dominating online ad platforms](#).

Yet another showed Google engaged in [targeted turnout operations](#) aimed to boost voter participation in pro-Democrat demographics in key states ahead of the 2016 election. The effort was dubbed a "silent donation" by a top Google employee.

Evidence for Google's partisan activities is now overwhelming. [President Trump has previously warned Google](#), as well as other Silicon Valley giants, not to engage in censorship or partisan activities. Google continues to defy him.

HOW GOOGLE RIGS ELECTIONS AND CHARACTER ASSASSINATION ATTACKS AROUND THE GLOBE FOR GOOGLE VC'S POLITICAL IDEOLOGIES AND VENDETTAS

BY ROBERT EPSTEIN

Authorities in the UK have finally figured out that fake news stories and Russian-placed ads are not the real problem. The UK Parliament is about to impose stiff penalties— not on the people who place the ads or write the stories, but on the Big Tech platforms that determine which ads and stories people actually see.

Parliament's plans will almost surely be energized by the latest leak of damning material from inside Google's fortress of secrecy: The Wall Street Journal recently reported on emails exchanged among Google employees in January 2017 in which they strategized about how to alter Google search results and other ephemeral experiences to counter President Donald Trump's newly imposed travel ban. The company claims that none of these plans was ever implemented, but who knows?

While U.S. authorities have merely held hearings, EU authorities have taken dramatic steps in recent years to limit the powers of Big Tech, most recently with a comprehensive law that protects user privacy—the General Data Protection Regulation—and a whopping \$5.1 billion fine against Google for monopolistic practices in the mobile device market. Last year, the European Union also levied a \$2.7 billion fine against Google for filtering and ordering search results in a way that favored their own products and services. That filtering and ordering, it turns out, is of crucial importance.

As years of research I've been conducting on online influence has shown, content per se is not the real threat these days; what really matters is (a) which content is selected for users to see, and (b) the way that content is ordered in search results, search suggestions, newsfeeds, message feeds, comment lists, and so on. That's where the power lies to shift opinions, purchases, and votes, and that power is held by a disturbingly small group of people.

I say "these days" because the explosive growth of a handful of massive platforms on the internet—the largest, by far, being Google and the next largest being Facebook—has changed everything. Millions of people and organizations are constantly trying to get their content in front of our eyes, but for more than 2.5 billion people around the world—soon to be more than 4 billion—the responsibility for what algorithms do should always lie with the people who wrote the algorithms and the companies that deployed them.

In randomized, controlled, peer-reviewed research I've conducted with thousands of people, I've shown repeatedly that when people are undecided, I can shift their opinions on just about any topic just by changing how I filter and order the information I show them. I've also shown that when, in multiple searches, I show people more and more information that favors one candidate, I can shift opinions even farther. Even more disturbing, I can do these things in ways that are completely invisible to people and in ways that don't leave paper trails for authorities to trace.

Worse still, these new forms of influence often rely on ephemeral content—information that is generated on the fly by an algorithm and then disappears forever, which means that it would be difficult, if not impossible, for authorities to reconstruct. If, on Election Day this coming November, Mark Zuckerberg decides to broadcast go-out-and-vote reminders mainly to members of one political party, how would we be able to detect such a manipulation? If we can't detect it, how would we be able to reduce its impact? And how, days or weeks later, would we be able to turn back the clock to see what happened?

Of course, companies like Google and Facebook emphatically reject the idea that their search and newsfeed algorithms are being tweaked in ways that could meddle in elections. Doing so would undermine the public's trust in their companies, spokespeople have said. They insist that their algorithms are complicated, constantly changing, and subject to the "organic" activity of users.

This is, of course, sheer nonsense. Google can adjust its algorithms to favor any candidate it chooses no matter what the activity of users might be, just as easily as I do in my experiments. As legal scholar Frank Pasquale noted in his recent book *The Black Box Society*,¹ blaming algorithms just doesn't cut it; the responsibility for what an algorithm does should always lie with the people who wrote the algorithm and the companies that deployed the algorithm. Alan Murray, president of Fortune, recently framed the issue this way: "Rule one in the Age of AI: Humans remain accountable for decisions, even when made by machines."

Given that 95 percent of donations from Silicon Valley generally go to Democrats, it's hard to imagine that the algorithms of companies like Facebook and Google don't favor their favorite candidates. A newly leaked video of a 2016 meeting at Google shows without doubt that high-ranking Google executives share a strong political preference, which could easily be expressed in algorithms. The favoritism might be deliberately programmed or occur simply because of unconscious bias. Either way, votes and opinions shift.

It's also hard to imagine how, in any election in the world, with or without intention on the part of company employees, Google search results would fail to tilt toward one candidate. Google's search algorithm certainly has no equal-time rule built into it; we wouldn't want it to! We want it to tell us what's best, and the algorithm will indeed always favor one dog food over another, one music service over another, and one political candidate over another. When the latter happens votes and opinions shift.

Here are 10 ways—seven of which I am actively studying and quantifying—that Big Tech companies could use to shift millions of votes this coming November with no one the wiser. Let's hope, of course, that these methods are not being used and will never be used, but let's be realistic too; there's generally no limit to what people will do when money and power are on the line.

1. Search Engine Manipulation Effect (SEME)

Ongoing research I began in January 2013 has shown repeatedly that when one candidate is favored over another in search results, voting preferences among undecided voters shift dramatically—by 20 percent or more overall, and by up to 80 percent in some demographic groups. This is partly because people place inordinate trust in algorithmically generated output, thinking, mistakenly, that algorithms are inherently objective and impartial.

But my research also suggests that we are conditioned to believe in high-ranking search results in much the same way that rats are conditioned to press levers in Skinner boxes. Because most searches are for simple facts ("When was Donald Trump born?"), and because correct answers to simple questions inevitably turn up in the first position, we are taught, day after day, that the higher a search result appears in the list, the more true it must be. When we finally search for information to help us make a tough decision ("Who's better for the economy, Trump or Clinton?"), we tend to believe the information on the web pages to which high-ranking search results link.

As The Washington Post reported last year, in 2016, I led a team that developed a system for monitoring the election-related search results Google, Bing, and Yahoo were showing users in the months leading up to the presidential election, and I found pro-Clinton bias in all 10 search positions on the first page of Google's search results. Google responded, as usual, that it has "never re-ranked search results on any topic (including elections) to manipulate political sentiment"—but I never claimed it did. I found what I found, namely that Google's search results favored Hillary Clinton; "re-ranking"—an obtuse term Google seems to have invented to confuse people—is irrelevant.

Because (a) many elections are very close, (b) 90 percent of online searches in most countries are conducted on just one search engine (Google), and (c) internet penetration is high in most countries these days—higher in many countries than it is in the United States—it is possible that the outcomes of upwards of 25 percent of

the world's national elections are now being determined by Google's search algorithm, even without deliberate manipulation on the part of company employees. Because, as I noted earlier, Google's search algorithm is not constrained by equal-time rules, it almost certainly ends up favoring one candidate over another in most political races, and that shifts opinions and votes.

2. Search Suggestion Effect (SSE)

When Google first introduced autocomplete search suggestions—those short lists you see when you start to type an item into the Google search bar—it was supposedly meant to save you some time. Whatever the original rationale, those suggestions soon turned into a powerful means of manipulation that Google appears to use aggressively.

My recent research suggests that (a) Google starts to manipulate your opinions from the very first character you type, and (b) by fiddling with the suggestions it shows you, Google can turn a 50–50 split among undecided voters into a 90–10 split with no one knowing. I call this manipulation the Search Suggestion Effect (SSE), and it is one of the most powerful behavioral manipulations I have ever seen in my nearly 40 years as a behavioral scientist.

How will you know whether Google is messing with your election-related search suggestions in the weeks leading up to the election? You won't.

3. The Targeted Messaging Effect (TME)

If, on Nov. 8, 2016, Mr. Zuckerberg had sent go-out-and-vote reminders just to supporters of Mrs. Clinton, that would likely have given her an additional 450,000 votes. I've extrapolated that number from Facebook's own published data.

Because Zuckerberg was overconfident in 2016, I don't believe he sent those messages, but he is surely not overconfident this time around. In fact, it's possible that, at this very moment, Facebook and other companies are sending out targeted register-to-vote reminders, as well as targeted go-out-and-vote reminders in primary races. Targeted go-out-and-vote reminders might also favor one party on Election Day in November.

My associates and I are building systems to monitor such things, but because no systems are currently in place, there is no sure way to tell whether Twitter, Google, and Facebook (or Facebook's influential offshoot, Instagram) are currently tilting their messaging. No law or regulation specifically forbids the practice, and it would be an easy and economical way to serve company needs. Campaign donations cost money, after all, but tilting your messaging to favor one candidate is free.

4. Opinion Matching Effect (OME)

In March 2016, and continuing for more than seven months until Election Day, Tinder's tens of millions of users could not only swipe to find sex partners, they could also swipe to find out whether they should vote for Trump or Clinton. The website iSideWith.com—founded and run by two friends—with no obvious qualifications—claims to have helped more than 49 million people match their opinions to the right candidate. Both CNN and USA Today have run similar services, currently inactive.

I am still studying and quantifying this type of, um, helpful service, but so far it looks like (a) opinion matching services tend to attract undecided voters—precisely the kinds of voters who are most vulnerable to manipulation, and (b) they can easily produce opinion shifts of 30 percent or more without people's awareness.

At this writing, iSideWith is already helping people decide who they should vote for in the 2018 New York U.S. Senate race, the 2018 New York gubernatorial race, the 2018 race for New York District 10 of the U.S. House of Representatives, and, believe it or not, the 2020 presidential race. Keep your eyes open for other

matching services as they turn up, and ask yourself this: Who wrote those algorithms, and how can we know whether they are biased toward one candidate or party?

5. Answer Bot Effect (ABE)

More and more these days, people don't want lists of thousands of search results, they just want the answer, which is being supplied by personal assistants like Google Home devices, the Google Assistant on Android devices, Amazon's Alexa, Apple's Siri, and Google's featured snippets—those answer boxes at the top of Google search results. I call the opinion shift produced by such mechanisms the Answer Bot Effect (ABE).

My research on Google's answer boxes shows three things so far: First, they reduce the time people spend searching for more information. Second, they reduce the number of times people click on search results. And third, they appear to shift opinions 10 to 30 percent more than search results alone do. I don't yet know exactly how many votes can be shifted by answer bots, but in a national election in the United States, the number might be in the low millions.

6. Shadowbanning

Recently, Trump complained that Twitter was preventing conservatives from reaching many of their followers on that platform through shadowbanning, the practice of quietly hiding a user's posts without the user knowing. The validity of Trump's specific accusation is arguable, but the fact remains that any platform on which people have followers or friends can be rigged in a way to suppress the views and influence of certain individuals without people knowing the suppression is taking place. Unfortunately, without aggressive monitoring systems in place, it's hard to know for sure when or even whether shadowbanning is occurring.

7. Programmed Virality and the Digital Bandwagon Effect

Big Tech companies would like us to believe that virality on platforms like YouTube or Instagram is a profoundly mysterious phenomenon, even while acknowledging that their platforms are populated by tens of millions of fake accounts that might affect virality.

In fact, there is an obvious situation in which virality is not mysterious at all, and that is when the tech companies themselves decide to shift high volumes of traffic in ways that suit their needs. And aren't they always doing this? Because Facebook's algorithms are secret, if an executive decided to bestow instant Instagram stardom on a pro-Elizabeth Warren college student, we would have no way of knowing that this was a deliberate act and no way of countering it.

The same can be said of the virality of YouTube videos and Twitter campaigns; they are inherently competitive—except when company employees or executives decide otherwise. Google has an especially powerful and subtle way of creating instant virality using a technique I've dubbed the Digital Bandwagon Effect. Because the popularity of websites drives them higher in search results, and because high-ranking search results increase the popularity of websites (SEME), Google has the ability to engineer a sudden explosion of interest in a candidate or cause with no one—perhaps even people at the companies themselves—having the slightest idea they've done so. In 2015, I published a mathematical model showing how neatly this can work.

8. The Facebook Effect

Because Facebook's ineptness and dishonesty have squeezed it into a digital doghouse from which it might never emerge, it gets its own precinct on my list.

In 2016, I published an article detailing five ways that Facebook could shift millions of votes without people knowing: biasing its trending box, biasing its center newsfeed, encouraging people to look for election-related material in its search bar (which it did that year!), sending out targeted register-to-vote reminders, and sending out targeted go-out-and-vote reminders.

I wrote that article before the news stories broke about Facebook's improper sharing of user data with multiple researchers and companies, not to mention the stories about how the company permitted fake news stories to proliferate on its platform during the critical days just before the November election's problems the company is now trying hard to mitigate. With the revelations mounting, on July 26, 2018, Facebook suffered the largest one-day drop in stock value of any company in history, and now it's facing a shareholder lawsuit and multiple fines and investigations in both the United States and the EU. Facebook desperately needs new direction, which is why I recently called for Zuckerberg's resignation. The company, in my view, could benefit from the new perspectives that often come with new leadership.

9. Censorship

I am cheating here by labeling one category as censorship, because censorship is the selective and biased suppression of information and can be perpetrated in so many different ways.

Shadowbanning could be considered a type of censorship, for example, and in 2016, a Facebook whistleblower claimed he had been on a company team that was systematically removing conservative news stories from Facebook's newsfeed. Now, because of Facebook's carelessness with user data, the company is openly taking pride in rapidly shutting down accounts that appear to be Russia-connected even though company representatives sometimes acknowledge that they don't have all the facts.

Meanwhile, Zuckerberg has crowed about his magnanimity in preserving the accounts of people who deny the Holocaust, never mentioning the fact that provocative content propels traffic that might make him richer. How would you know whether Facebook was selectively suppressing material that favored one candidate or political party? You wouldn't. (For a detailed look at nine ways Google censors content, see my essay "The New Censorship," published in 2016.)

10. The Digital Customization Effect (DCE)

Any marketer can tell you how important it is to know your customer. Now, think about that simple idea in a world in which Google has likely collected the equivalent of millions of Word pages of information about you. If you randomly display a banner ad on a web page, out of 10,000 people, only five are likely to click on it; that's the CTR, the clickthrough rate (0.05 percent). But if you target your ad, displaying it only to people whose interests it matches, you can boost your CTR a hundredfold.

That's why Google, Facebook, and others have become increasingly obsessed with customizing the information they show you: They want you to be happily and mindlessly clicking away on the content they show you.

In the research I conduct, my impact is always larger when I am able to customize information to suit people's backgrounds. Because I know very little about the participants in my experiments, however, I am able to do so in only feeble ways, but the tech giants know everything about you—even things you don't know about yourself. This tells me that the effect sizes I find in my experiments are probably too low. The impact that companies like Google are having on our lives is quite possibly much larger than I think it is. Perhaps that doesn't scare you, but it sure scares me.

The Same Direction

OK, you say, so much for Epstein's list! What about those other shenanigans we've heard about: voter fraud (Trump's explanation for why he lost the popular vote), gerrymandering, rigged voting machines, targeted ads placed by Cambridge Analytica, votes cast over the internet, or, as I mentioned earlier, those millions of bots designed to shift opinions. What about hackers like Andrés Sepúlveda, who spent nearly a decade using computer technology to rig elections in Latin America? What about all the ways new technologies make dirty tricks easier in elections? And what about those darn Russians, anyway? To all that I say: kid stuff. Dirty tricks have been around since the first election was held millennia ago. But

unlike the new manipulative tools controlled by Google and Facebook, the old tricks are competitive—it's your hacker versus my hacker, your bots versus my bots, your fake news stories versus my fake news stories—and sometimes illegal, which is why Sepúlveda's efforts failed many times and why Cambridge Analytica is dust.

Cyberwar, a new book by political scientist Kathleen Hall Jamieson, reminds us that targeted ads and fake news stories can indeed shift votes, but the numbers are necessarily small. It's hard to overwhelm your competitor when he or she can play the same games you are playing.

Now, take a look at my numbered list. The techniques I've described can shift millions of votes without people's awareness, and because they are controlled by the platforms themselves, they are entirely noncompetitive. If Google or Facebook or Twitter wants to shift votes, there is no way to counteract their manipulations. In fact, at this writing, there is not even a credible way of detecting those manipulations.

And what if the tech giants are all leaning in the same political direction? What if the combined weight of their subtle and untraceable manipulative power favors one political party? If 150 million people vote this November in the United States, with 20 percent still undecided at this writing (that's 30 million people), I estimate that the combined weight of Big Tech manipulations could easily shift upwards of 12 million votes without anyone knowing. That's enough votes to determine the outcomes of hundreds of close local, state, and congressional races throughout the country, which makes the free-and-fair election little more than an illusion.

Full disclosure: I happen to think that the political party currently in favor in Silicon Valley is, by a hair (so to speak), the superior party at the moment. But I also love America and democracy, and I believe that the free-and-fair election is the bedrock of our political system. I don't care how right these companies might be; lofty ends do not justify shady means, especially when those means are difficult to see and not well understood by either authorities or the public.

Can new regulations or laws save us from the extraordinary powers of manipulation the Big Tech companies now possess? Maybe, but our leaders seem to be especially regulation-shy these days, and I doubt, in any case, whether laws and regulations will ever be able to keep up with the new kinds of threats that new technologies will almost certainly pose in coming years.

I don't believe we are completely helpless, however. I think that one way to turn Facebook, Google, and the innovative technology companies that will succeed them, into responsible citizens is to set up sophisticated monitoring systems that detect, analyze, and archive what they're showing people—in effect, to fight technology with technology.

As I mentioned earlier, in 2016, I led a team that monitored search results on multiple search engines. That was a start, but we can do much better. These days, I'm working with business associates and academic colleagues on three continents to scale up systems to monitor a wide range of information the Big Tech companies are sharing with their users—even the spoken answers provided by personal assistants. Ultimately, a worldwide ecology of passive monitoring systems will make these companies accountable to the public, with information bias and online manipulation detectable in real time.

With November drawing near, there is obviously some urgency here. At this writing, it's not clear whether we will be fully operational in time to monitor the midterm elections, but we're determined to be ready for 2020.

- Robert Epstein is a senior research psychologist at the American Institute for Behavioral Research and Technology in California. Epstein, who holds a doctorate from Harvard University, is the former editor-in-chief of Psychology Today and has published 15 books and more than 300 articles on internet

influence and other topics. He is currently working on a book called *Technoslavery: Invisible Influence in the Internet Age and Beyond*. His research is featured in the new documentary *The Creepy Line*. You can find him on Twitter @DrREpstein.

SEND IN MORE TIPS AND TORRENT ALL OF YOUR FILES ON GNUTELLA NETWORKS AROUND THE GLOBE!

Interdiction Tactics You Can Use To Terminate Google, as Provided by Human Rights Groups From Around The Globe:

- 1) Break up Google's global monopoly. Send a complaint letter about your realization that Google is an Illicit Monopoly which controls the primary points of web access, and then censors public information in order to eliminate anything that does not comply with Eric Schmidt's ideology to the anti-trust and regulatory commissions in each nation on Earth. Organize groups to do this in large volumes. Allowing Google to keep its monopoly and just add a bunch of new little divisions is NOT a break-up beneficial to the public!***
- 2) Google has manifested a system which records everything you do and keeps a lifetime file on you, attached to your social security number and name. Write every U.S. politician and demand that laws be made to stop Google from doing that.***
- 3) Google, and it's underling partners, create a psychological profile of who you vote for, what your beliefs are, what can be used to trick you into doing what Eric Schmidt and his partners want, and what your dating life is like. Write letters to Congress demanding that the FBI observe the erasure of all of those illicit files Google keeps on you.***
- 4) Every time you touch any network connected device, it is recorded, analyzed, time-stamped, GPS located, and put in the master surveillance file and digitally attached to your name, social security number and global surveillance code. Never connect to a Google product with anything that has a network modem, a plug or a battery.***
- 5) Anytime you check in, on any social media site, it is recorded, analyzed, time-stamped, GPS located, and put in your master surveillance file. Never check-in or update anything about yourself on Google or other social media.***
- 6) Google lies to advertisers by faking user stats and impressions to make it look like Google is bigger than it is. A huge number of users on Google are FAKE! Contact every company that advertises on Google and encourage them to sue Google for fraud. Contact every advertising organization and encourage them to file a class-action lawsuit against Google for fraud.***
- 7) Every single personal fact, text, email, comment, blog response, form you fill out, or any other activity you conduct on, near, or with your computer, phone or smart device goes into your surveillance digital file to build a psychological, emotional, political, financial and manipulation study of your life. Ask Congress, the EU and all regulators to make it illegal for Google to do this.***
- 8) Google uses these surveillance tricks to try to make you buy certain products, to make you vote for who***

Eric Schmidt wants you to vote for and to steer you, subliminally, into believing what Eric Schmidt believes. Ask Congress, the EU and all regulators to make it illegal for Google to do this.

9) Schmidt, and his minions, are able to actually rig the Google system, around the world, to eliminate certain people, views, perspectives or experiences. Ask Congress, the EU and all regulators to make it illegal for Google to do this.

10) Eric Schmidt's sexual and marital deviancies are documented in the media. Schmidt's deviant tendencies extend well beyond the bedroom. Not quite so illuminated are his political and ideological beliefs. Schmidt believes that, because he got some huge government exclusives, which made him rich, that he is smarter than everyone else. Expose ALL sides of Eric Schmidt and his Silicon Valley Mafia, in the news. Schmidt has spent over \$1B to try to keep his name out of the news. Make sure he stays in the headlines and gets (((exposed))).

11) Schmidt has used his billions to buy one of the largest accruals of âYes Menâ the world has ever seen. He surrounds himself, twenty deep, with whimpering hipster sycophants, who drone on, endlessly, with affirmations of his self-aggrandizing ego. Deliver messages to Schmidt, in person, at his home, office and public events telling him what is really going on.

12) Schmidt placed many of his âYes Menâ, and âYes Womenâ, in the White House. No company, in modern America, has put more of it's people inside the U.S. Government. DOX and Out every Google agent in government offices.

13) Eric Schmidt bought The White House, the privacy of the public and control of the Internet. Now it is up to the rest of the world to decide if they want to roll over and let Eric Schmidt and his Silicon Valley weasels shove it in, deep and hard, or, finally reject Google across the map. Organize neighborhood anti-Google postings on every bulletin board you can find.

14) Google receives hundreds of billions of dollars of exclusive government handouts at the expense of taxpayers and competitors. Write letters ordering your elected representatives to cut-off all government contracts to Google.

15) Google operated a monopolistic empire using state and federal funding in violation of anti-trust laws and business ethics. Demand that the FTC file monopoly charges against Google and end the cover-ups.

16) Google ordered, and operated âhit jobsâ on competitors using state and federal staff and resources. Put the same kinds of hit-jobs on every Google executive and VC.

17) Google has an executive team which strategically plans, organizes and implements the penetration of state and federal government agencies in order to illicitly steer funds and government policy to the will of Google's owners.

18) Google pays its public policy agents with cash, stock warrants, revolving door jobs, stock valuation manipulations, search engine rigging and mass-market mood manipulation data rigging worth tens of billions of dollars in unreported campaign funding and influence buying. That is a felony. It is a violation of campaign finance laws. Write to the FEC and demand that Google be prosecuted!

19) Google orders itâs staff, within government agencies, to curtail all law enforcement and regulatory control of Googleâs actions. Google programs its employees to believe that anything that Google does is for âthe greater goodâ and that âGoogle mindfulness must always prevailâ in a manner that abuses naive young employees and sets them up to not question Googleâs actions.

- 20) *Citizens Arrest* Google executives and VC's at their homes, offices, trade-shows or restaurants and turn them in to the FBI along with a CD of all of their crimes. Follow the correct procedures for documenting and staging your Citizen's Arrest of Google VC's and executives.
- 21) Use databases and VOAT.CO to track and expose the tax evasion schemes, Irish false-fronts, PACS, Political stock market bribes, Stock market rigging, Google's staff and VC Hookers, voter manipulations, expenses frauds, Crony Dept. of Energy and Dept. of Transportation payola, election rigging and other forensically documented crimes.
- 22) Google engages in the hiding of Internet links, controlled by Google, in order to negatively affect the brand and reputation and income of competitors, across the web, globally. Report this and demand Congress stop Google.
- 23) Google engages in the posting of character assassination articles about competitors, the production of which were partially coordinated by Google staff and investors; , along with with it's attack contractors, on the first line of the front page of their search engine and locking those attacks there so that no outside IT or other positive global news stories could move it. Demand that Congress fund private funds to pay for lawsuits by the public against Google to stop these attacks.
- 24) Google executives and venture capitalists have the highest sexual abuse, sex trafficking and sexual deviancy record of any corporation in the USA. Over 800 Google-related twisted sex incidents have been recorded including: The Doy Katz underage sex arrest; The Mike Goguen Anal Sex Slave Sex trafficking case; The Eric Schmidt Sex Penthouse case; The Joe Lonsdale rape case; The Ellen Pao Sex abuse case; The Ravi Kumar hooker death case; The Forrest Hayes Sex murder case; The Stanford Frat house rape cover-ups; The Intern sex abuse scandals; The Stanford Graduate School of Google Teacher: The Brock Allen Turner Rapes; Dean Garth Saloner Sex scandals; The Silicon Valley Hooker parties; The Rosewood Hotel Thursday Night Sex Pick-up scene for Google VC's, The Larry Page/Elon Musk gay romp rumors; The Eric Schmidt Marriage Cheating Scandal; The Elon Musk Divorces; The Plane-loads of Ukrainian prostitutes being flown into SFO for Google Executives and VC's; The brutal assaults of women by Gurbaksh Chahal; The #PizzaGate Connections to vast numbers of Google people; The Draper Fisher Intern Rape Investigation; The Famous Gay Tech CEO's Who Have a Cover Wives Revelations; The Sergey Brin 3 Way Sex Romp With His Google Glasses Staff; and hundreds more need to be publicly discussed and analyzed.
- 25) Upon legal receipt of removal demands from competitors and their lawyers, Google refused, in writing, to remove the attacks in order to damage competitors maximally. Public support needs to be expanded to sue Google for refusing to cease attacks upon demand.
- 26) Google engages in DNS, web pointing, down-ranking and search results targeting in order to damage the Internet operation of competitors web-sites and press releases. This must be reported to FTC and SEC as felony abuse of public rights.
- 27) Google's competitors hired IT experts to do a multi-year sting and IT analysis investigation, involving the setting of hundreds of a trap servers around the world, to prove, over a five+ year period, that Google was manipulating search results in order to damage some parties and falsely enhance others, who were Google's covert partners. Other parties, including universities, research groups, the European Union, The Government of China, The Government of Russia and other parties, have now emulated and proven these results showing definitive proof of Google's malicious manipulation of the Internet in order to damage it's competitors and promote it's friends while also damaging it's friend's competitors. Google must be sued for these crimes. Sue each Google Executive and VC, individually, one at a time, in Small Claims Court!

- 28) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Gawker Media.
- 29) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Steve Spinner.
- 30) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Wilson Sonsini.
- 31) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Steven Chu.
- 32) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider and founding investor: In-Q-Tel.
- 33) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider John Doerr.
- 34) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Vinod Khosla.
- 35) Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider New America Foundation.
- 36) Google sought to Cheat Rather Than Compete against competitor's products, which have now been proven, by industry documentation, to have been superior to Google's. Expose Google as a business cheater.
- 37) In light of the accruing charges and evidence, Google was forced to break-up it's main operation, changing it's name from: Google to Alphabet, in order to attempt to mitigate it's damages in this, and other pending cases, by creating a false-front structure whereby Google attempt to hide their tax and legal liability obligations by, on paper, reducing the operation into smaller parts. Expose Google's sham corporate structure and shell companies and recognize the entire operation, and each and every part, and owner, as being liable for competitors damages.
- 38) Google copied dozens of competitors products, which the federal patent office had issued patents and secured files on as being first developed by others, years before any interest in, or development by competitors. Google either gave away the copied products, in order to terminate competitor's revenue opportunities, or used billions of dollars of unjust rewards secured, according to the U.S. Treasury, from ill-gotten gains via contract manipulations and illegitimate tax loss write-offs and payola tax waivers, to flood competitor's out of the market and order financing blacklists to be created by their investors. The New York Times article on Larry Page proves him to be a patent thief. Google's patent attorney runs the U.S. Patent Office. Demand that Google's shill: Michelle Lee from the U.S. Patent Office be investigated and that a public fund be established by Congress to help small inventors who are attacked and blockaded by Google.
- 39) Google engaged in additional malicious harassment using retained writers who did not disclose their shill, meat puppet, Troll and Click-Farm media attack services function for Google. Dox and Expose the media shills that Google hires.
- 40) Google engaged in other malicious activities, against competitors, disclosed to competitors by whistle-blowers and ex-employees of Google which are documented in Google electronic communications.

The NSA, CIA, DIA, FBI and Congress have all of Googles emails since 2006. Demand public revelation of those emails.

41) Larry Page, Eric Schmidt, Ann Wojcicki and Sergey Brin did not build the first Google, they stole the technology from others. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

42) Google, YouTube, Alphabet, Jigsaw, In-Q-Tel, and all of their various front organizations, are controlled by the same people with the same bizarre agenda. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand an end to the cover-ups with letters to Congress. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

43) Google, and a company called Kleiner Perkins, have a campaign payola deal with White House executives. This deal trades search engine rigging for Cleantech â green moneyâ handouts ordered up by White House staff from various state and federal agencies. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

44) Google has a contracted relationship with rogue groups, like In- Q-Tel, Media Matters and New America Foundation; who use U.S. treasury funds to attack competitors. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

45) While it is well known that the CIA finances Google it is unclear if Google works for the CIA or the CIA works for Google. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

46) Google staged a program to give â freeâ Google computers and software to children in order to indoctrinate them when they are young like McDonalds does by putting playgrounds at all of the McDonalds. Googleâ s child propaganda effort copied the CIAâ s South American indoctrination program to a T. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

47) Google has paid money to Gawker Media and Gawker Media has paid money to Google for smear campaigns to help Obama and Debbie Wasserman. Members of the public can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

48) Google and Gawker Media have a series of quid-pro-quo relationships which provide for the mutual deployment of character assassinations of their business and political enemies. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

49) Google has placed over 400 of Googleâ s staff inside of the U.S. Government and the California State Government. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

50) Googleâ s lawyer, and other Google associates, work in and control the U.S. Patent Office for the protection of Google patent territory. competitors can prove it in court! News reports, Congressional and

law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

51) Google has always had, and today fully has, total control over the text, links, results, adjacent results and all positioning of each and every Google search result and Mnemonic impression and Google selectively adjusts those results in order to harm competitors and political adversaries and hype investor friends and partners like Elon Musk. Google lied to government regulators, in multiple nations, when Google stated that executives had no control over Google results. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

52) Competitors, competitors lawyers and others sent hundreds of communications to Google asking Google to stop harassing, cyber-stalking and search engine locking attacks against competitor's which Google refused to comply with and in fact, increased the attacks mentioned herein. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

53) Google receives operational orders from White House campaign financiers. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

54) Google stated on the record that itâs search results change every few hours yet Google locked each attack on competitors on the same top lines of the front page of Google, around the globe, for over five years without any shift in placement. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

55) Google meets the legal definition as an organized crime RICO-violation illicit â Cartelâ . competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

56) Google lies about how many women and blacks it hires. Expose this fact.

57) Google bribes politicians to get Googleâs owned politicians to harm Googleâs competitors. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

58) Competitors placed thousands of server sensors in different ISPâs in different locations around the entire internet for extended periods of time in order to catch Google rigging the internet and did, in fact, catch Google rigging the internet. Others have emulated these tests and also caught Google rigging internet results. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

59) Google rigs the internet to hide misdeeds and company failures by Elon Musk while, concurrently, pumping up and hyping cover stories to hide those misdeeds because Larry Page and Elon Musk are best boyfriends and Google owns parts of Tesla and Tesla battery suppliers. Competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

60) Email this document to anybody in your contact manager that has a @Gmail address. Send this to

everyone you discover with a @Gmail address so you can save them from getting â data-raped and privacy abusedâ by Google.

61) Google has received billions and billions of U.S. Treasury money that were exclusively provided to Google. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

62) Google pumps marketing hype for stock market pump-and-dumps which inure exclusively to Google investors and against Google enemies. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

63) Google sabotaged and circumvented competitor's government funding and rerouted it to Google. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

64) Post this phrase everywhere you can: â FRIENDS DONâ T LET FRIENDS USE GOOGLEâ

65) Write every trade office of every nation on Earth and show them this document and tell them that â ...most people hate Googleâ and to â ...not do business with Google or their citizens will look upon them unkindly.â

66) Make certain that everyone in the world knows that: Hidden Voice Commands Could Hijack Your Phone from up to 10 feet away, or via embedded Youtube audio. (vocativ.com) and that nobody should use Googleâ s YouTube.

67) Google uses cheap overseas labor to keep Americans out of work. Sue Google and file charges with equal opportunity and job rights organizations if Google discriminates against you because you are a U.S. Citizen. Post notices on all Asian blogs about what a lying, abusive, crappy employer Google is.

68) Put a President like Donald Trump in the White House.

69) Have Donald Trump and Congress make laws that stop Google from doing Googleâ s crimes and domestic business abuses.

70) Expose Googleâ s entire DNS ring to every global interdiction team that can provide counter-measures to Googleâ s illegal control of information.

71) Find everyone that Google has abused and provide them with a free, pre-written, in-pro-per lawsuit against Google.

72) Hire private a public investigators to hunt down all of Googleâ s staff and VCâ s illegal sex trafficking operations: ie: Michael Goguen, Forrest Hayes, John Doerr, Sergy Brin, etc. (There are hundreds) and help the victims sue those abusers.

73) Shut down every abuse of domestic workers by filing lawsuits against Googleâ s abuse of Women, Blacks, Young Asian boys, interns and other groups.

74) Lobby The White House for Executive Orders that make Google stop running an illicit Cartel.

75) Sue each Google manager, director, owner and VC in small claims court individually for the maximum

amount that the small claims court allows. Each voter should sue each executive of Google and get their \$5000.00, \$10,000.00, etc. payments from Google for Google's damages to them on a personal basis.

76) Do not FOR EVEN ONE SECOND let Google PR shills spin the hype that "Those were the previous people at Google that did all of those bad things, we are all new and shiny and non-Evil" That is their lie! The people at Google have gotten MORE evil!

77) Post, point to, link to and publicize the Corbett Report videos about Google at: <https://www.corbettreport.com/> with such links as: <https://www.corbettreport.com/just-be-evil-the-unauthorized-history-of-google/>

78) Call out each member of the U.S. Congress for being such blind idiots and putting up with the Google executives lies and "delay, and defer" tactics in public hearings. It is "beyond obvious" that Google is a cult-like cartel of extremist manipulators. If Congressional leaders are too stupid to understand how subliminal messages and server-based mass behavior manipulation works then they should not be in office. Google has no intention of "doing a better job". Demand the arrest of Google executives.

HERE IS WHAT YOU MUST KNOW ABOUT HOW GOOGLE IS USING YOUR ELECTRONICS TO ABUSE YOUR HUMAN SOCIAL RIGHTS, PROFITEER OFF YOUR PRIVACY AND PLAY MIND-GAMES WITH POLITICS:

With daily headlines about Google's [Big Tech scandals](#), sex cults and [clandestine data-sharing](#), there's no better time to read up on these topics.

The choices below are listed in no particular order and, wherever possible, we link to author websites and privacy-respecting sources.

Reading about surveillance capitalism may not warm your heart, but it could put a fire in your belly and encourage you to [#DemandFreedom in 2019](#).

[The End of Trust](#) by McSweeney's Issue 54 (Nov. 2018)

Compiled by the team at the Electronic Frontier Foundation (EFF) for McSweeney's, this collection features writing by luminaries like Cory Doctorow, Gabriella Coleman, Edward Snowden, Bruce Schneier, and many more. Among the gems within is a conversation between artist Trevor Paglen and journalist Julia Angwin, with Paglen having this to say about the intersection of freedom and privacy:

"I think I had the sense of growing up within structures that didn't work for me and feeling like there was a deep injustice around that. Feeling like the world was set up to move you down certain paths and to enforce certain behaviors and norms [didn't] work for me, and realizing that the value of this word formerly known as privacy, otherwise known as liberty, plays not only at the scale of the individual, but also as a kind of public resource that allows for the possibility of, on one hand, experimentation, but then, on the other hand, things like civil liberties and self-representation."

[Click Here to Kill Everybody: Security and Survival in a Hyper-connected World](#) by Bruce Schneier, W. W. Norton & Company (Sep. 2018)

Schneier's latest book is a sobering account of the pitfalls of modern technology. It covers a lot of ground, such as the huge gap between security and implementation in Internet-of-Things devices. The author has a gift for raising questions that cause the reader to rethink the underlying technology behind seemingly-simple tech, like network-connected baby monitors:

â Theyâ re surveillance devices by design, and can pick up a lot more than a babyâ s cries. Of course, I had a lot of security questions. How is the audio and video transmission secured? Whatâ s the encryption algorithm? How are encryption keys generated, and who has copies of them? If data is stored on the cloud, how long is it stored and how is it secured? How does the smartphone app, if the monitor uses one, authenticate to the cloud server?â

[American Spies: Modern Surveillance, Why You Should Care, and What to Do About It](#) â Jennifer Stisa Granick, Cambridge University Press (Jan. 2017)

Granick gives the reader a real sense of just how big, and just how pervasive, U.S. intelligence programs really are. The author doesnâ t stop with government programs, however, and calls out Big Tech for its major role in population surveillance:

â Spying is thriving not only because of technology, but also because of modern business models. Much of the modern privacy problem is the result of people giving up their data â knowingly or otherwise â to obtain cool new products and services.â

[Nothing to Hide: The False Tradeoff between Privacy and Security](#) â Daniel J. Solove, Yale University Press (Jan. 2013)

This is a now-classic rumination on the deeply important role of privacy in autonomy and freedom. It quickly demolishes the â nothing to hide argumentâ , a constant refrain in todayâ s privacy debates, and continues to shed light on social and legal dimensions of surveillance. Here, Solove highlights contradictory perceptions of audio and video snooping:

â The electronic-surveillance statutes strongly protect against the governmentâ s eavesdropping on your conversations but donâ t protect against the governmentâ s watching you. This distinction doesnâ t make a lot of sense. Video surveillance involves similar threats to privacy as audio surveillance. As one court noted: â Television surveillance is identical in its indiscriminate character to wiretapping and bugging. It is even more invasive of privacyâ \ but it is not more indiscriminate: the microphone is as â dumbâ as the television camera; both devices pick up anything within their electronic reach, however irrelevant to the investigation.'â

[Dragnet Nation: A Quest for Privacy, Security, and Freedom in a World of Relentless Surveillance](#) â Julia Angwin, Times Books (Feb. 2014)

Angwin is no stranger to the many facets of surveillance capitalism, and this book is just as prescient now as it was five years ago. In that time, the authorâ s concerns have been validated, with the pace of Big Techâ s blunders only escalating. Angwin keeps the human element in constant view, giving vital context to headlines about privacy and data catastrophes:

â Skeptics say: â Whatâ s wrong with all of our data being collected by unseen watchers? Who is being harmed?â Admittedly, it can be difficult to demonstrate personal harm from a data breach. If Sharon or Bilal is denied a job or insurance, they may never know which piece of data caused the denial. People placed on the no-fly list are never informed about the data that contributed to the decision. But, on a larger scale, the answer is simple: troves of personal data can and will be abused.â

[Free Software, Free Society, 3rd Edition](#) â Richard M. Stallman, Free Software Foundation (Oct. 2015)

Stallmanâ s status as an icon in the Free/Libre world is often the focus of press. Bootstrapping GNU and the Free Software movement was no small feat, but there is too little focus on Stallmanâ s writing. The authorâ s philosophy is grounded in practical concerns and explained with a clear and mindful tone that few writers possess. This most recent edition of Stallmanâ s collected essays describes just how important liberty is in the contemporary digital context:

â If â cloud computingâ has a meaning, it is not a way of doing computing, but rather a way of thinking about computing: a devil-may-care approach which says, â Donâ t ask questions. Donâ t worry about who controls your computing or who holds your data. Donâ t check for a hook hidden inside our service before you swallow it. Trust companies without hesitation.â In other words, â Be a sucker.â â

[Defending Politically Vulnerable Organizations Online](#) â Sean Brooks, Center for Long-Term Cybersecurity (July 2018)

In this report from the Center for Long-Term Cybersecurity (CLTC), Brooks provides a broad overview of the cybersecurity landscape. This is a great introduction for industry professionals and consumers alike, though it focuses on civil organizations that are often targeted for political reasons. The reportâ s citations are a valuable resource in their own right, providing context as well as technological solutions. The author is quick to point out lackluster investment in cybersecurity in both the public and private spheres, describing the vicious cycle this creates:

â The broad asymmetry between attackers and defenders online is unsurprising; politically vulnerable organizations lack resources and are therefore particularly under-protected. This problem is not unique to politically vulnerable organizations. Many public and private organizations have underinvested in cybersecurity and have become soft targets for criminals and other bad actors. Online attackers have continued to develop their offensive capabilities, exacerbating the mismatch.â

[Bad Blood: Secrets and Lies in a Silicon Valley Startup](#) â John Carreyrou, Penguin Random House (May 2018)

This story of the rise and fall of biotech startup Theranos is a page-turner, described here with all the detail of investigative journalism. Carreyrouâ s most interesting passages are those where the author describes the culture of Silicon Valley, where fraudulent CEO Elizabeth Holmes was desperately trying to fill the mold of her Big Tech heroes:

â For a young entrepreneur building a business in the heart of Silicon Valley, it was hard to escape the shadow of Steve Jobs. By 2007, Appleâ s founder had cemented his legend in the technology world and in American society at largeâ l to anyone who spent time with Elizabeth, it was clear that she worshipped Jobs and Apple.â

[The Doomsday Machine: Confessions of a Nuclear War Planner](#) â Daniel Ellsberg, Bloomsbury USA (Dec. 2017)

Decades after the legendary whistleblower disclosed the Pentagon Papers to the American public, Ellsbergâ s warnings will still ring alarm bells and shock the reader. Through first-hand accounts, the author chronicles the nuclear program of the 1960â s and the dangers of the present day, describing the contrasting roles of secrecy and transparency, as well as their relationship to trust:

â Like discussion of covert operations and assassination plots, nuclear war plans and threats are taboo for public discussion by the small minority of officials and consultants who know anything about them. In addition to their own sense of identity as trustworthy keepers of these most-sensitive secrets, there is a strong careerist aspect to their silence.â

[The Participatory Condition in the Digital Age](#) â Electronic Mediations Book 51 (Nov. 2016)

This collection of articles spans the gamut from street protests to online â hacktivismâ to Free and Open-Source collaboration. The editors expertly summarize the transdisciplinary tone of the volume in an introduction thatâ s worth contemplating in its own right. Among other issues, Gabriella Coleman describes Kate Crawfordâ s work on the power and scale of spying:

â Ubiquitous surveillance facilitated by [information and communications technology or ICTs] â what Crawford designates as â algorithmic listeningâ â and the gathering of personal data currently

operated by web-based corporations (commercial surveillance) and governments (the NSA program, for example) are not simply matters of privacy but also of scale and lack of accountability.

[Privacy and Big Data: The Players, Regulators, and Stakeholders](#) â Terence Craig & Mary Ludloff, Oâ Reilly Media (Sep. 2011)

Published at a time when â Big Dataâ was more of a buzzword than a factor of everyday life, this book is a quick and easy introduction to the perils of the data economy. The lessons would seem dated if they werenâ t still applicable, and thereâ s perhaps nothing more prescient than the fact that data can not only be sold by Big Tech to business partners, it can be given away:

â While the IP stakeholders have been busy redefining â privacyâ for their own ends, Google, Yahoo, Facebook, and others have been equally busy making billions of dollars collecting your data and using it for targeted advertising. Of course, any company or organization that collects data can offer it for sale or free.â

[Habeas Data: Privacy vs. the Rise of Surveillance Tech](#) â Cyrus Farivar, Melville House (May 2018)

Farivar exposes the role of common, household tech in the global surveillance apparatus, diving into the court cases and legal precedent that shapes the scope and limits of privacy and security. Above all, the author steeps his analysis in history, with quotes from legal heavyweights like Louis Brandeis, here discussing wiretaps in a famous dissenting opinion:

â â The progress of science in furnishing the Government with means of espionage is not likely to stop with wiretapping,â Brandeis wrote. â Ways may someday be developed by which the Government, without removing papers from secret drawers, can reproduce them in court, and by which it will be enabled to expose to a jury the most intimate occurrences of the home.â

[Dr. Robert Epstein: Google Has the â Power to Flip ...](#)

â Thatâ s right and of course in most elections, especially close ones, itâ s the undecided people who determine the outcome of the election, so if you can swing a lot of undecided people â and Google has at least three ways to do that that weâ re studying,â responded Epstein.

AP Exclusive: Google tracks your movements, like it or not

By RYAN NAKASHIMA

<https://apnews.com/828aefab64d4411bac257a07c1af0ecb>

Link copied!

SAN FRANCISCO (AP) — Google wants to know where you go so badly that it records your movements even when you explicitly tell it not to.

An Associated Press investigation found that many Google services on Android devices and iPhones store your location data even if you've used a privacy setting that says it will prevent Google from doing so.

Computer-science researchers at Princeton confirmed these findings at the AP's request.

For the most part, Google is upfront about asking permission to use your location information. An app like Google Maps will remind you to allow access to location if you use it for navigating. If you agree to let it record your location over time, Google Maps will display that history for you in a timeline that maps out your daily movements.

Storing your minute-by-minute travels carries privacy risks and has been used by police to determine the location of suspects — such as a warrant that police in Raleigh, North Carolina, [served on Google](#) last year to find devices near a murder scene. So the company will let you pause a setting called Location History.

Google says that will prevent the company from remembering where you've been. Google's [support page on the subject](#) states: "You can turn off Location History at any time. With Location History off, the places you go are no longer stored."

That isn't true. Even with Location History paused, some Google apps automatically store time-stamped location data without asking. (It's possible, although laborious, [to delete it](#).)

For example, Google stores a snapshot of where you are when you merely open its Maps app. Automatic daily weather updates on Android phones pinpoint roughly where you are. And some searches that have nothing to do with location, like chocolate chip cookies, or kids science kits, pinpoint your precise latitude and longitude accurate to the square foot and save it to your Google account.

The privacy issue affects some two billion users of devices that run Google's Android operating software and hundreds of millions of worldwide iPhone users who rely on Google for maps or search.

Storing location data in violation of a user's preferences is wrong, said Jonathan Mayer, a Princeton computer scientist and former chief technologist for the Federal Communications Commission's enforcement bureau. A researcher from Mayer's lab confirmed the AP's findings on multiple Android devices; the AP conducted its own tests on several iPhones that found the same behavior.

"If you're going to allow users to turn off something called Location History, then all the places where you maintain location history should be turned off," Mayer said. "That seems like a pretty straightforward position to have."

Google says it is being perfectly clear.

“There are a number of different ways that Google may use location to improve people’s experience, including: Location History, Web and App Activity, and through device-level Location Services,” a Google spokesperson said in a statement to the AP. “We provide clear descriptions of these tools, and robust controls so people can turn them on or off, and delete their histories at any time.”

To stop Google from saving these location markers, the company says, users can turn off another setting, one that does not specifically reference location information. Called “Web and App Activity” and enabled by default, that setting stores a variety of information from Google apps and websites to your Google account.

When paused, it will prevent activity on any device from being saved to your account. But leaving “Web & App Activity” on and turning “Location History” off only prevents Google from adding your movements to the “timeline,” its visualization of your daily travels. It does not stop Google’s collection of other location markers.

You can delete these location markers by hand, but it’s a painstaking process since you have to select them individually, unless you want to delete all of your stored activity.

You can see the stored location markers on a page in your Google account at myactivity.google.com, although they’re typically scattered under several different headers, many of which are unrelated to location.

To demonstrate how powerful these other markers can be, the AP created [a visual map](#) of the movements of Princeton postdoctoral researcher Gunes Acar, who carried an Android phone with Location history off, and shared a record of his Google account.

The map includes Acar’s train commute on two trips to New York and visits to The High Line park, Chelsea Market, Hell’s Kitchen, Central Park and Harlem. To protect his privacy, The AP didn’t plot the most telling and frequent marker — his home address.

Huge tech companies are under increasing scrutiny over their data practices, following a series of privacy scandals at Facebook and new data-privacy rules recently adopted by the European Union. Last year, the business news site Quartz found that Google was [tracking Android users](#) by collecting the addresses of nearby cellphone towers even if all location services were off. Google changed the practice and insisted it never recorded the data anyway.

Critics say Google’s insistence on tracking its users’ locations stems from its drive to boost advertising revenue.

“They build advertising information out of data,” said Peter Lenz, the senior geospatial analyst at Distillery, a rival advertising technology company. “More data for them presumably means more profit.”

The AP learned of the issue from K. Shankari, a graduate researcher at UC Berkeley who studies the commuting patterns of volunteers in order to help urban planners. She noticed that her Android phone prompted her to rate a shopping trip to Kohl’s, even though she had turned Location History off.

“So how did Google Maps know where I was?” she asked in a [blog post](#).

The AP wasn’t able to recreate Shankari’s experience exactly. But its attempts to do so revealed Google’s tracking. The findings disturbed her.

“I am not opposed to background location tracking in principle,” she said. “It just really bothers me that it is not explicitly stated.”

Google offers a more accurate description of how Location History actually works in a place youâd only see if you turn it off â a popup that appears when you â pauseâ Location History on your [Google account webpage](#) . There the company notes that â some location data may be saved as part of your activity on other Google services, like Search and Maps.â

Google offers additional information in a popup that appears if you re-activate the â Web & App Activityâ setting â an uncommon action for many users, since this setting is on by default. That popup states that, when active, the setting â saves the things you do on Google sites, apps, and services ... and associated information, like location.â

Warnings when youâre about to turn Location History off via Android and iPhone device settings are more difficult to interpret. On Android, the popup explains that â places you go with your devices will stop being added to your Location History map.â On the iPhone, it simply reads, â None of your Google apps will be able to store location data in Location History.â

The iPhone text is technically true if potentially misleading. With Location History off, Google Maps and other apps store your whereabouts in a section of your account called â My Activity,â not â Location History.â

Since 2014, Google has let advertisers track the effectiveness of online ads at [driving foot traffic](#) , a feature that Google has said relies on user location histories.

The company is pushing further into such location-aware tracking to drive ad revenue, which rose 20 percent last year to \$95.4 billion. At a Google Marketing Live summit in July, Google executives [unveiled a new tool](#) called â local campaignsâ that dynamically uses ads to boost in-person store visits. It says it can measure how well a campaign drove foot traffic with data pulled from Google usersâ location histories.

Google also says location records stored in My Activity are used to target ads. Ad buyers can target ads to specific locations â say, a mile radius around a particular landmark â and typically have to pay more to reach this narrower audience.

While disabling â Web & App Activityâ will stop Google from storing location markers, it also prevents Google from storing information generated by searches and other activity. That can limit the effectiveness of the Google Assistant, the companyâs digital concierge.

Sean OâBrien, a Yale Privacy Lab researcher with whom the AP shared its findings, said it is â disingenuousâ for Google to continuously record these locations even when users disable Location History. â To me, itâs something people should know,â he said.

There are several alternatives to the standard DNS system, for instance:

<https://www.opennic.org/> <https://zeronet.io/> <https://namecoin.org/>

I'd suggest Voat, Gab, Minds, etc to get an alternative URL from <https://www.opennic.org/> just in case their regular domain is hijacked by these retards and to consider <https://bitmitigate.com/> as an alternative to CloudFlare which has proven to be untrustworthy.

- [permalink](#)

[[^](#)] [NeoTheFox](#) 1 points (+1|-0) ago

Yes, OpenNIC is the way to go - it's really easy to setup, it supports DNSSec, it has a lot of servers, and Namecoin resolution.

- [permalink](#)
- [parent](#)

[[^](#)] [googlehangoutsnow](#) 1 points (+1|-0) ago (edited ago)

Opennic also supports the Namecoin domains, it's probably the easiest for people to get started with.

- [permalink](#)
- [parent](#)

[\[â \] WakkoWarner](#) 3 points (+3|-0) ago

True, it is the easiest to set up... the only concern i have with OpenNic is that it is still somehow centralized, there is still people behind it that might get blackmailed or that might not believe in freedom of speech and start banning domains they don't agree with... but as a backup/emergency plan i think it is good enough.

**GOOGLE IS A SICK, TWISTED, CENSORSHIP AND
PROPAGANDA OPERATION**

The New Censorship

How did Google become the internet's censor and master manipulator, blocking access to millions of websites?

The New Censorship

•

(Eva Hambach/AFP/Getty Images)

By [Robert Epstein](#) | Contributor

Google, Inc., isn't just the world's biggest purveyor of information; it is also the world's biggest censor.

The company maintains at least nine different blacklists that impact our lives, generally without input or authority from any outside advisory group, industry association or government agency. Google is not the only company suppressing content on the internet. Reddit has frequently been [accused](#) of banning postings on specific topics, and a [recent report](#) suggests that Facebook has been deleting conservative news stories from its newsfeed, a practice that might have a significant effect on public opinion — even on voting. Google, though, is currently the biggest bully on the block.

When Google's employees or algorithms decide to block our access to information about a news item, political candidate or business, opinions and votes can shift, reputations can be ruined and businesses can crash and burn. Because online censorship is entirely unregulated at the moment, victims have little or no recourse when they have been harmed. Eventually, authorities will almost certainly have to step in, just as they did when [credit bureaus](#) were regulated in 1970. The alternative would be to allow a large corporation to wield an especially destructive kind of power that should be exercised with great restraint and should belong only to the public: the power to shame or exclude.

If Google were just another mom-and-pop shop with a sign saying "we reserve the

right to refuse service to anyone," that would be one thing. But as the golden gateway to all knowledge, Google has rapidly become an essential in people's lives — nearly as essential as air or water. We don't let public utilities make arbitrary and secretive decisions about denying people services; we shouldn't let Google do so either.

[The New Too Big to Fail](#)

Big social media companies like Facebook and Google have too much power to manipulate elections.

Let's start with the most trivial blacklist and work our way up. I'll save the biggest and baddest — one the public knows virtually nothing about but that gives Google an almost obscene amount of power over our economic well-being — until last.

1. The autocomplete blacklist. This is a list of [words and phrases that are excluded from the autocomplete feature](#) in Google's search bar. The search bar instantly suggests multiple search options when you type words such as "democracy" or "watermelon," but it freezes when you type profanities, and, at times, it has frozen when people typed words like "torrent," "bisexual" and "penis." At this writing, it's freezing when I type "clitoris." The autocomplete blacklist can also be used to protect or discredit political candidates. As recently [reported](#), at the moment autocomplete shows you "Ted" (for former GOP presidential candidate Ted Cruz) when you type "lying," but it will *not* show you "Hillary" when you type "crooked" — not even, on my computer, anyway, when you type "crooked hill." (The nicknames for Clinton and Cruz coined by Donald Trump, of course.) If you add the "a," so you've got "crooked hilla," you get the very odd suggestion "crooked Hillary Bernie." When you type "crooked" on Bing, "crooked Hillary" pops up instantly. Google's list of forbidden terms varies by region and individual, so "clitoris" might work for you. (Can you resist checking?)

2. The Google Maps blacklist. This list is a little more creepy, and if you are concerned about your privacy, it might be a good list to be on. The cameras of Google Earth and Google Maps have photographed your home for all to see. If you don't like that, [just move](#)," Google's former CEO Eric Schmidt said. Google also maintains a [list of properties](#) it either blacks out or blurs out in its images. Some are probably military installations, some the residences of wealthy people, and some — well, who knows? Martian pre-invasion enclaves? Google doesn't say.

3. The YouTube blacklist. YouTube, which is owned by Google, allows users to flag inappropriate videos, at which point Google censors weigh in and sometimes remove them, but not, according to a [recent report](#) by Gizmodo, with any great consistency — except perhaps when it comes to politics. Consistent with the company's strong and [open support](#) for liberal political candidates, Google employees seem far more apt

to ban politically conservative videos than liberal ones. In December 2015, singer Joyce Bartholomew [sued YouTube](#) for removing her openly pro-life music video, but I can find no instances of pro-choice music being removed. YouTube also sometimes acquiesces to the censorship demands of foreign governments. Most recently, in return for overturning a three-year ban on YouTube in Pakistan, it agreed to allow [Pakistan's government](#) to determine which videos it can and cannot post.

4. The Google account blacklist. A couple of years ago, Google consolidated a number of its products — Gmail, Google Docs, Google+, YouTube, Google Wallet and others — so you can access all of them through your one Google account. If you somehow violate Google's vague and intimidating [terms of service](#) agreement, you will join the ever-growing list of people who are shut out of their accounts, which means you'll lose access to *all* of these interconnected products. Because virtually no one has ever read this lengthy, legalistic agreement, however, people are [shocked when they're shut out](#), in part because Google [reserves the right](#) to "stop providing Services to you — at any time." And because Google, one of the largest and richest companies in the world, has no customer service department, getting reinstated can be difficult. (Given, however, that all of these services gather personal information about you to sell to advertisers, losing one's Google account has been judged by some to be a [blessing in disguise](#).)

RELATED CONTENT

[No Likes for Facebook Manipulation](#)

The social media giant isn't a news site, but it still shouldn't be messing with its trending topics.

5. The Google News blacklist. If a librarian were caught trashing all the liberal newspapers before people could read them, he or she might get in a heap o' trouble. What happens when most of the librarians in the world have been replaced by a single company? Google is now the largest news aggregator in the world, tracking tens of thousands of news sources in [more than thirty languages](#) and recently adding thousands of small, [local news sources](#) to its inventory. It also selectively bans news sources as it pleases. [In 2006](#), Google was accused of excluding conservative news sources that generated stories critical of Islam, and the company has also been accused of banning [individual columnists and competing companies](#) from its news feed. In December 2014, facing a new law in Spain that would have charged Google for scraping content from Spanish news sources (which, after all, have to pay to prepare their news), [Google suddenly withdrew](#) its news service from Spain, which led to an [immediate drop](#) in traffic to Spanish new stories. That drop in traffic is the problem: When a large aggregator bans you from its service, fewer people find your news stories, which means opinions will shift away from those you support. Selective blacklisting of news sources is a powerful way of promoting a political, religious or moral agenda, with no one the wiser.

6. The Google AdWords blacklist. Now things get creepier. More than [70 percent of Google's \\$80 billion in annual revenue](#) comes from its AdWords advertising service, which it implemented in 2000 by [infringing](#) on a similar system already patented by

Overture Services. The way it works is simple: Businesses worldwide bid on the right to use certain keywords in short text ads that link to their websites (those text ads are the AdWords); when people click on the links, those businesses pay Google. These ads appear on Google.com and other Google websites and are also interwoven into the content of more than a million non-Google websites — Google's "Display Network." The problem here is that if a Google executive decides your business or industry doesn't meet its moral standards, it bans you from AdWords; these days, with Google's reach so large, that can quickly put you out of business. In 2011, Google blacklisted an Irish political group that defended sex workers but which did not *provide* them; after a protest, the company eventually [backed down](#).

In May 2016, Google [blacklisted an entire industry](#) — companies providing high-interest "payday" loans. As always, the company [billed](#) this dramatic move as an exercise in social responsibility, failing to note that it is a [major investor](#) in LendUp.com, which is in the same industry; if Google fails to blacklist LendUp (it's too early to tell), the industry ban might turn out to have been more of an anticompetitive move than one of conscience. That kind of hypocrisy has turned up before in AdWords activities. Whereas Google [takes a moral stand](#), for example, in banning ads from companies promising quick weight loss, in 2011, Google forfeited a whopping \$500 million to the U.S. Justice Department for having knowingly allowed Canadian drug companies to sell drugs illegally in the U.S. for years through the AdWords system, and several state attorneys general believe that Google has [continued to engage](#) in similar practices since 2011; investigations are ongoing.

7. The Google AdSense blacklist. If your website has been approved by AdWords, you are eligible to sign up for Google AdSense, a system in which Google places ads for various products and services on your website. When people click on those ads, Google pays *you*. If you are good at driving traffic to your website, you can make millions of dollars a year running AdSense ads — all without having any products or services of your own. Meanwhile, Google makes a net profit by charging the companies behind the ads for bringing them customers; this accounts for about [18 percent](#) of Google's income. Here, too, there is scandal: In April 2014, in two posts on PasteBin.com, someone claiming to be a former Google employee working in their AdSense department [alleged](#) the department engaged in a regular practice of dumping AdSense customers just before Google was scheduled to pay them. To this day, no one knows whether the person behind the posts was legit, but one thing is clear: Since that time, real lawsuits filed by real companies have, according to [WebProNews](#), been "piling up" against Google, alleging the companies were unaccountably dumped at the last minute by AdSense just before large payments were due, in some cases payments as high as \$500,000.

[The Loan That's Safe at Any Rate](#)

It's past time to eliminate interest rate caps on small-dollar installment loans.

8. The search engine blacklist. Google's ubiquitous search engine has indeed become the gateway to virtually all information, handling 90 percent of search in most

countries. It dominates search because its index is so large: Google indexes more than [45 billion](#) web pages; its next-biggest competitor, Microsoft's Bing, indexes a mere 14 billion, which helps to explain the poor quality of Bing's search results.

Google's dominance in search is why businesses large and small live in constant "[fear of Google](#)," as Mathias Dopfner, CEO of Axel Springer, the largest publishing conglomerate in Europe, put it in an open letter to Eric Schmidt in 2014. According to Dopfner, when Google made one of its [frequent adjustments](#) to its search algorithm, one of his company's subsidiaries dropped dramatically in the search rankings and lost 70 percent of its traffic within a few days. Even worse than the vagaries of the adjustments, however, are the dire consequences that follow when Google employees somehow conclude you have violated their "guidelines": You either get banished to the rarely visited Netherlands of search pages beyond the first page (90 percent of all clicks go to links on that first page) or completely removed from the index. In 2011, Google took a "[manual action](#)" of a "[corrective](#)" nature against retailer J.C. Penney â punishment for Penney's alleged use of a legal SEO technique called "link building" that many companies employ to try to boost their rankings in Google's search results. Penney was demoted 60 positions or more in the rankings.

Search ranking manipulations of this sort don't just ruin businesses; they also affect people's opinions, attitudes, beliefs and behavior, as my research on the [Search Engine Manipulation Effect](#) has demonstrated. Fortunately, definitive information about Google's punishment programs is likely to turn up over the next year or two thanks to legal challenges the company is facing. In 2014, a Florida company called e-Ventures Worldwide filed a [lawsuit](#) against Google for "completely removing almost every website" associated with the company from its search rankings. When the company's lawyers tried to get internal documents relevant to Google's actions through typical litigation discovery procedures, Google refused to comply. In July 2015, a judge [ruled](#) that Google had to honor e-Ventures' discovery requests, and that case is now moving forward. More significantly, in April 2016, the Fifth Circuit Court of Appeals [ruled](#) that the attorney general of Mississippi â supported in his efforts by the attorneys general of 40 other states â has the right to proceed with broad discovery requests in his own investigations into Google's secretive and often arbitrary practices.

This brings me, at last, to the biggest and potentially most dangerous of Google's blacklists â which Google's calls its "quarantine" list.

9. The quarantine list. To get a sense of the scale of this list, I find it helpful to think about an old movie â the classic 1951 film "The Day the Earth Stood Still," which starred a huge metal robot named Gort. He had laser-weapon eyes, zapped terrified humans into oblivion and had the power to destroy the world. Klaatu, Gort's alien master, was trying to deliver an important message to earthlings, but they kept shooting him before he could. Finally, to get the world's attention, Klaatu demonstrated the enormous power of the alien races he represented by shutting down â at noon New York time â all of the electricity on earth for exactly 30 minutes. *The earth stood still.*

Substitute "ogle" for "rt," and you get "Google," which is every bit as powerful as Gort but with a much better public relations department â so good, in fact, that you are probably unaware that on Jan. 31, 2009, *Google blocked access to virtually the entire internet*. And, as if not to be outdone by a 1951 science fiction move, it did so for 40

minutes.

Impossible, you say. Why would do-no-evil Google do such an apocalyptic thing, and, for that matter, *how*, technically, could a single company block access to more than 100 million websites?

RELATED CONTENT

[Court Upholds FCC's Net Neutrality Rules](#)

The rules aim to prevent internet providers from interfering with web traffic.

The answer has to do with the dark and murky world of *website blacklists* — ever-changing lists of websites that contain malicious software that might infect or damage people's computers. There are many such lists — even tools, such as [blacklistalert.org](#), that scan multiple blacklists to see if your IP address is on any of them. Some lists are kind of mickey-mouse — repositories where people submit the names or IP addresses of suspect sites. Others, usually maintained by security companies that help protect other companies, are more high-tech, relying on "crawlers" — computer programs that continuously comb the internet.

But the best and longest list of suspect websites is Google's, launched in May 2007. Because Google is crawling the web [more extensively](#) than anyone else, it is also in the best position to find malicious websites. In 2012, [Google acknowledged](#) that each and every day it adds about 9,500 new websites to its quarantine list and displays malware warnings on the answers it gives to between 12 and 14 million search queries. It won't reveal the exact number of websites on the list, but it is certainly in the millions on any given day.

In 2011, [Google blocked an entire subdomain](#), co.cc, which alone contained 11 million websites, justifying its action by claiming that most of the websites in that domain appeared to be "spammy." According to [Matt Cutts](#), still the leader of Google's web spam team, the company "reserves the right" to take such action when it deems it necessary. (The right? Who gave Google that right?)

And that's nothing: According to [The Guardian](#), on Saturday, Jan. 31, 2009, at 2:40 pm GMT, Google blocked *the entire internet* for those impressive 40 minutes, supposedly, said the company, because of "human error" by its employees. It would have been 6:40 am in Mountain View, California, where Google is headquartered. Was this time chosen because it is one of the few hours of the week when all of the world's [stock markets](#) are closed? Could this have been another of the [many pranks](#) for which Google employees are so famous? In 2008, Google [invited the public](#) to submit applications to join the "first permanent human colony on Mars." Sorry, [Marsophiles](#); it was just a prank.

When Google's search engine shows you a search result for a site it has quarantined, you see warnings such as, "The site ahead contains malware" or "This site may harm your computer" on the search result. That's useful information if that website actually contains malware, either because the website was set up by bad guys or because a

legitimate site was infected with malware by hackers. But [Google's crawlers often make mistakes](#), blacklisting websites that have merely been "hijacked," which means the website itself isn't dangerous but merely that accessing it through the search engine will forward you to a malicious site. My own website, <http://drrobertepstein.com>, was hijacked in this way in early 2012. Accessing the website directly wasn't dangerous, but trying to access it through the Google search engine forwarded users to a malicious website in Nigeria. When this happens, Google not only warns you about the infected website on its search engine (which makes sense), it also blocks you from accessing the website directly through multiple browsers — even non-Google browsers. (*Hmm. Now that's odd. I'll get back to that point shortly.*)

RELATED CONTENT

[Who Watches the Data Mongers?](#)

The recent revelation that Facebook ran creepy "emotional contagion" tests shouldn't be a surprise.

The mistakes are just one problem. The bigger problem is that even though it takes only a fraction of a second for a crawler to list you, after your site has been cleaned up Google's crawlers sometimes take days or even weeks to delist you — long enough to threaten the existence of some businesses. This is quite bizarre considering how rapidly automated online systems operate these days. Within seconds after you pay for a plane ticket online, your seat is booked, your credit card is charged, your receipt is displayed and a confirmation email shows up in your inbox — a complex series of events involving multiple computers controlled by at least three or four separate companies. But when you inform Google's automated blacklist system that your website is now clean, you are simply advised to check back occasionally to see if any action has been taken. To get delisted after your website has been repaired, you either have to struggle with the company's online Webmaster tools, which are far from friendly, or you have to hire a security expert to do so — typically for a fee ranging between \$1,000 and \$10,000. No expert, however, can speed up the mysterious delisting process; the best he or she can do is set it in motion.

So far, all I've told you is that Google's crawlers scan the internet, sometimes find what appear to be suspect websites and put those websites on a quarantine list. That information is then conveyed to users through the search engine. So far so good, except of course for the mistakes and the delisting problem; one might even say that Google is performing a public service, which is how some people who are familiar with the quarantine list defend it. But I also mentioned that Google somehow blocks people from accessing websites directly through multiple browsers. How on earth could it do that? How could Google block you when you are trying to access a website using Safari, an Apple product, or Firefox, a browser maintained by Mozilla, the self-proclaimed "[nonprofit defender](#) of the free and open internet"?

The key here is browsers. No browser maker wants to send you to a malicious website, and because Google has the best blacklist, major browsers such as Safari and Firefox — and Chrome, of course, Google's own browser, as well as browsers that load

through Android, Google's mobile operating system â check Google's quarantine list before they send you to a website. (In November 2014, Mozilla announced it will no longer list Google as its default search engine, but it also disclosed that it will [continue to rely](#) on Google's quarantine list to screen users' search requests.)

If the site has been quarantined by Google, you see one of those big, scary images that say things like "Get me out of here!" or "Reported attack site!" At this point, given the default security settings on most browsers, most people will find it impossible to visit the site â but who would want to? If the site is not on Google's quarantine list, you are sent on your way.

OK, that explains *how* Google blocks you even when you're using a non-Google browser, but *why* do they block you? In other words, how does blocking you feed the ravenous advertising machine â the sine qua non of Google's existence?

Have you figured it out yet? The scam is as simple as it is brilliant: When a browser queries Google's quarantine list, it has just shared information with Google. With Chrome and Android, you are always giving up information to Google, but you are also doing so even if you are using non-Google browsers. *That* is where the money is â more information about search activity kindly provided by competing browser companies. How much information is shared will depend on the particular deal the browser company has with Google. In a maximum information deal, Google will learn the identity of the user; in a minimum information deal, Google will still learn which websites people want to visit â valuable data when one is in the business of ranking websites. Google can also charge fees for access to its quarantine list, of course, but that's not where the real gold is.

Chrome, Android, Firefox and Safari currently carry about 92 percent of all [browser traffic](#) in the U.S. â 74 percent worldwide â and these numbers are increasing. As of this writing, that means Google is regularly collecting information through its quarantine list from more than 2.5 billion people. Given the [recent pact](#) between Microsoft and Google, in coming months we might learn that Microsoft â both to save money and to improve its services â has also started using Google's quarantine list in place of its own much smaller list; this would further increase the volume of information Google is receiving.

To put this another way, Google has grown, and is still growing, on the backs of some of its competitors, with end users oblivious to Google's antics â as usual. It is yet another example of what I have called "[Google's Dance](#)" â the remarkable way in which Google puts a false and friendly public face on activities that serve only one purpose for the company: increasing profit. On the surface, Google's quarantine list is yet another way Google helps us, free of charge, breeze through our day safe and well-informed. Beneath the surface, that list is yet another way Google accumulates more information about us to sell to advertisers.

You may disagree, but in my view Google's blacklisting practices put the company into the role of thuggish internet cop â a role that was never authorized by any government, nonprofit organization or industry association. It is as if the biggest bully in town suddenly put on a badge and started patrolling, shuttering businesses as it pleased, while also secretly peeping into windows, taking photos and selling them to the highest bidder.

RELATED CONTENT

[Your Phone Is Becoming More Powerful](#)

Digital assistants soon will know everything about us. That could be both helpful and scary.

Consider: Heading into the holiday season in late 2013, [an online handbag business](#) suffered a 50 percent drop in business because of blacklisting. In 2009, it took [an eco-friendly pest control company](#) 60 days to leap the hurdles required to remove Google's warnings, long enough to nearly go broke. And sometimes the blacklisting process appears to be personal: In May 2013, the highly opinionated PC Magazine columnist John Dvorak wondered "[When Did Google Become the Internet Police?](#)" after both his website and podcast site were blacklisted. He also ran into the delisting problem: "It's funny," he wrote, "how the site can be blacklisted in a millisecond by an analysis but I have to wait forever to get cleared by the same analysis doing the same scan. Why is that?"

Could Google really be arrogant enough to mess with a prominent journalist? According to [CNN](#), in 2005 Google "blacklisted all CNET reporters for a year after the popular technology news website published personal information about one of Google's founders" â Eric Schmidt â "in a story about growing privacy concerns." The company declined to comment on CNN's story.

Google's mysterious and self-serving practice of blacklisting is one of many reasons Google should be regulated, just as phone companies and credit bureaus are. The E.U.'s recent [antitrust actions](#) against Google, the recently leaked [FTC staff report](#) about Google's biased search rankings, President Obama's call for regulating internet service providers â all have merit, but they overlook another danger. No one company, which is accountable to its shareholders but not to the general public, should have the power to instantly put another company out of business or block access to any website in the world. How frequently Google acts irresponsibly is beside the point; it has the *ability* to do so, which means that in a matter of seconds any of Google's 37,000 employees with the right passwords or skills could laser a business or political candidate into oblivion or even freeze much of the world's economy.

Some degree of censorship and blacklisting is probably necessary; I am not disputing that. But the suppression of information on the internet needs to be managed by, or at least subject to the regulations of, responsible public officials, with every aspect of their operations transparent to all.

Updated on June 23, 2016: Readers have called my attention to a 10th Google blacklist, which the company applies to its shopping service. In 2012, the shopping service [banned](#) the sale of weapons-related items, including some items that could still be sold through AdWords. Google's shopping [blacklisting policy](#), while reasonably banning the sale of counterfeit and copyrighted goods, also includes a catch-all category: Google can ban the sale of any product or service its employees deem to be "offensive or inappropriate." No means of recourse is stated.

Corrected on June 23, 2016: An earlier version of this post misidentified singer Joyce Bartholomew.

[Robert Epstein](#) Contributor

Robert Epstein (@DrREpstein) is Senior Research Psychologist at the American Institute for Behavioral Research and Technology in Vista, California. A long-time professor and researcher, Dr. Epstein has published fifteen books on artificial intelligence and other topics and is the former editor-in-chief of Psychology Today magazine.

GOOGLE IS A WORTHLESS WASTE OF TECHNOLOGY

A few weeks ago my house had a septic-tank emergency, which is as awful as it sounds. As unspeakable things began to burble up from my shower drain, I did what any smartphone-dependent person would: I frantically Googled something along the lines of *poop coming from shower drain bad what to do*. I was met with a slew of cookie-cutter websites, most of which appeared hastily generated and were choked with enough repetitive buzzwords as to be barely readable. Virtually everything I found was unhelpful, so we did the old-fashioned thing and called a professional. The emergency came and went, but I kept thinking about those middling search results—how they typified a zombified internet wasteland.

Like many, I use Google to answer most of the mundane questions that pop up in my day-to-day life. And yet that first page of search results feels like it's been surfacing fewer satisfying answers lately. I'm not alone; the frustration has become a persistent meme: that Google Search, what many consider an indispensable tool of modern life, is dead or dying. For the past few years, across various forums and social-media platforms, people have been claiming in viral posts that Google's flagship product is broken. Search *google dying* on Twitter or Reddit and you can see people grouching about it going back to the mid 2010s. Lately, though, the criticisms have grown louder.

In February, an engineer named Dmitri Brereton [wrote a blog post](#) about Google's search-engine decay, rounding up leading theories for why the product's results have gone to shit. The post quickly shot to the top of tech forums such as Hacker News and was widely shared on Twitter and even prompted a PR response from Google's Search liaison, Danny Sullivan, refuting one of Brereton's claims. You said in the post that quotes don't give exact matches. They really do. Honest, Sullivan wrote in a [series of tweets](#).

[Read: Be careful what you Google](#)

Brereton's most intriguing argument for the demise of Google Search was that savvy users of the platform no longer type instinctive keywords into the search bar and hit enter. The best Googlers—the ones looking for actionable or niche information, product reviews, and interesting discussions—know a cheat code to bypass the sea of corporate search results clogging the top third of the screen. Most of the web has become too inauthentic to trust, Brereton argued, therefore we resort to using Google, and appending

the word *reddit* to the end of our queries. Brereton cited Google Trends data that show that people are searching the word *reddit* on Google more than ever before.

Instead of scrolling through long posts littered with pop-up ads and paragraphs of barely coherent SEO chum to get to a review or a recipe, clever searchers got lively threads with testimonials from real people debating and interacting with one another. Most who use the Reddit hack are doing so for practical reasons, but it's also a small act of protest—a way to stick it to the Search Engine Optimization and Online Ad Industrial Complex and to attempt to access a part of the internet that feels freer and more *human*.

Google has built wildly successful mobile operating systems, mapped the world, changed how we email and store photos, and tried, with varying success, to build cars that drive themselves. This story, for example, was researched, in part, through countless Google Search queries and some Google Chrome browsing, written in a Google Doc, and filed to my editor via Gmail. Along the way, the company has collected an unfathomable amount of data on billions of people (frequently unbeknownst to them)—but Google's parent company, Alphabet, is still primarily an advertising business. In 2020, the company made [\\$147 billion](#) in revenue off ads alone, which is roughly 80 percent of its total revenue. Most of the tech company's products—Maps, Gmail—are Trojan horses for a gargantuan personalized-advertising business, and Search is the one that started it all. It is the modern template for what the technology critic Shoshana Zuboff termed [a surveillance capitalism](#).

The internet has grown exponentially and Google has expanded with it, helping usher in some of the web's greediest, most extractive tendencies. But scale is not always a blessing for technology products. Are we wringing our hands over nothing, or is Google a victim of its own success, rendering its flagship product—Search—less useful?

One can't really overstate the way that Google Search, when it rolled out in 1997, changed how people used the internet. Before Google came out with its goal to crawl the entire web and organize the world's information, search engines were moderately useful at best. And yet, in the early days, there was much more search competition than there is now; [Yahoo](#), [Altavista](#), and [Lycos](#) were popular online destinations. But Google's *PageRank* ranking algorithm helped crack the problem. The algorithm counted and indexed the number and quality of links that pointed to a given website. Rather than use a simple keyword match, PageRank figured that the best results would be websites that were linked to by many other high-quality websites. The algorithm worked, and the Google of the late 1990s seemed almost magical: You typed in what you were looking for, and what you got back felt not just relevant but intuitive. The machine understood.

Most people don't need a history lesson to know that Google has changed; they *feel* it. Try searching for a product on your smartphone and you'll see that what was [once a small teal bar](#) featuring one sponsored link is now a hard-to-decipher, multi-scroll slog, filled with paid-product carousels; multiple paid-link ads; the dreaded, algorithmically generated *People also ask* box; *another* paid carousel; a sponsored buying guide; and a Maps widget showing stores selling products near your location. Once you've scrolled through that, multiple screen lengths below, you'll find the unpaid search results. Like much of the internet in 2022, it feels monetized to death, soulless, and exhausting.

I cover Google for a living so I am obviously aware how the results page has evolved over the years. Today, I was searching for *hearing aids* for my dad on my phone and I was stunned by the number of ads, and non-link results. It's pretty stunning
pic.twitter.com/jZZzDWRzdO

There are all kinds of theories for those ever-intrusive ads. One is that the cost-per-click rates that Google charges advertisers [are down](#), because of competition from Facebook and Amazon (Google is [rolling out](#) larger commerce-search ad widgets in response this year) as well as a slowdown in paid-search-result spending. Another issue may stem from cookie-tracking changes that Google is implementing in response to privacy laws such as Europe's General Data Protection Regulation and the California Consumer Privacy Act. For the past two years, Google has been planning to remove third-party cookies from its Chrome browser. And though Google Search won't be affected by the cookie ban, the glut of search ads might be an attempt to recoup some of the money that Google stands to lose in the changes to Chrome. If so, this is an example of fixing one problem while creating another. But when I suggested this to Google, the company was unequivocal, arguing that "there is no connection" between Chrome's plans to phase out support for third-party cookies and Search ads. The company also said that the number of ads it shows in search results "has been capped for several years, and we have not made any changes." Google claims that, "on average over the past four years, 80 percent of searches on Google haven't had any ads at the top of search results."

Any hunt for answers about Google's Search algorithms will lead you into the world of SEO experts like Marie Haynes. Haynes is a consultant who has been studying Google's algorithms obsessively since 2008. Part of her job is to keep up with every small change made by the company's engineers and public communication by Google's Search-team blog. Companies that can divine the whims of Google's constantly updated algorithms are rewarded with coveted page real estate. Ranking high means more attention, which theoretically means more money. When Google announced in October 2020 that it would begin rolling out "passage indexing" — a new way for the company to pull out and rank discrete passages from websites — Haynes tried to figure out how it would change what people ultimately see when they query. Rather than reverse engineer posts to sound like bot-written babble, she and her team attempt to balance maintaining a page's integrity while also appealing to the algorithm. And though Google provides SEO insiders with frequent updates, the company's Search algorithms are a black box (a trade secret that it doesn't want to give to competitors or to spammers who will use it to manipulate the product), which means that knowing what kind of information Google will privilege takes a lot of educated guesswork and trial and error.

Haynes agrees that ads' presence on Search is worse than ever and the company's decision to prioritize its own products and features over organic results is frustrating. But she argues that Google's flagship product has actually gotten better and much more complex over time. That complexity, she suggests, might be why searching feels different right now. "We're in this transition phase," she told me, noting that the company has made significant advancements in artificial intelligence and machine learning to decipher user queries. Those technical changes have caused it to move away from the PageRank paradigm. But those efforts, she suggested, are in their infancy and perhaps still working out their kinks. In May 2021, Google [announced](#) MUM (short for Multitask Unified Model), a natural-language-processing technology for Search that is 1,000 times more powerful than its predecessor.

"The AI attempts to understand not just what the searcher is typing, but what the searcher is trying to get at," Haynes told me. "It's trying to understand the content inside pages and inside queries, and that will change the type of result people get." Google's focus on searcher intent could mean that when people type in keywords, they're not getting as many direct word matches. Instead, Google is trying to scan the query, make meaning from it, and surface pages that it thinks match that meaning. Despite being a bit sci-fi and creepy, the shift might feel like a loss of agency for searchers. Search used to feel like a tool that you controlled, but Google may start to behave more like, well, a person — a concierge that has its own ideas and processes. The problematic effects of increased AI inference over time are easy to imagine (while I was writing this article, a Google researcher [went viral claiming](#) he'd been placed on administrative leave after notifying the company that one of its AI chatbots — powered by *different* technology — had become

sentient, though the company disagrees). Google could use such technology to continue to lead people away from their intended searches and toward its own products and paid ads with greater frequency. Or, less deviously, it could simply gently algorithmically nudge people in unexpected directions. Imagine all the life decisions that you make in a given year based on information you process after Googling. This means that the stakes of Google's AI interpreting a searcher's *intent* are high.

[Read: Google's AI sentient chatbot is our self-deceiving future](#)

But some of Google's lifeless results are made by humans. Zach Verbit knows what it's like to serve at the pleasure of Google's Search algorithms. After college, Verbit took a freelance-writing gig with the HOTH, a marketing company that specializes in search-engine optimization. Verbit's soul-crushing job at the HOTH was to write blog posts that would help clients' sites rank highly. He spent hours composing listicles with titles like "10 Things to Do When Your Air-Conditioning Stopped Working." Verbit wrote posts that sounded robotic or like they were written by somebody who'd just discovered language. He had to write up to 10 posts a day on subjects he knew nothing about. Quickly, he started repurposing old posts for other clients' blogs. Those posts that sound like an AI wrote them? Sometimes they're from real people trying to jam in as many keywords as possible, Verbit told me.

That his hastily researched posts appeared high in search results left him dispirited. He quit the job after a year, describing the industry of search-gaming as a house of cards. His time in the SEO mines signaled to him the decline of Google Search, arguably the simplest, most effective, and most revolutionary product of the modern internet. "The more I did the job, the more I realized that Google Search is completely useless now," he said. HOTH's CEO, Marc Hardgrove disputed the notion that its client blog posts were "over-optimized" for SEO purposes and that the company discourages jargony posts as they don't rank as high. "Overusing keywords and creating un-compelling content would be detrimental to our success as an SEO company, he wrote in an email. "That's why The HOTH does not require, or even encourage, the writers we work with to overuse keywords into their blog posts to help with optimization."

Google *is* still useful for many, but the harder question is why its results feel more sterile than they did five years ago. Haynes's theory is that this is the result of Google trying to crack down on misinformation and low-quality content—especially around consequential search topics. In 2017, the company started talking publicly about a Search initiative called EAT, which stands for "expertise, authoritativeness, and trustworthiness." The company has rolled out numerous quality rater guidelines, which help judge content to determine authenticity. One such effort, titled *Your Money or Your Life*, applies rigorous standards to any pages that show up when users search for medical or financial information.

"Take crypto," Haynes explained. "It's an area with a lot of fraud, so unless a site has a big presence around the web and Google gets the sense they're known for expertise on that topic, it'll be difficult to get them to rank." What this means, though, is that Google's results on any topic deemed sensitive enough will likely be from established sources. Medical queries are far more likely to return WebMD or Mayo Clinic pages, instead of personal testimonials. This, Haynes said, is especially challenging for people looking for homeopathic or alternative-medicine remedies.

There's a strange irony to all of this. For years, researchers, technologists, politicians, and journalists have agonized and cautioned against the wildness of the internet and its penchant for amplifying conspiracy theories, divisive subject matter, and flat-out false information. Many people, myself included, have argued for platforms to surface quality, authoritative information above all else, even at the expense of profit. And it's possible that Google has, in some sense, listened (albeit after far too much inaction) and, maybe, partly succeeded in showing higher-quality results in a number of contentious categories. But instead of ushering in an era of perfect information, the changes might be behind the complainers' sense that Google Search has stopped delivering *interesting* results. In theory, we crave authoritative information, but authoritative

information can be dry and boring. It reads more like a government form or a textbook than a novel. The internet that many people know and love is the opposite—it is messy, chaotic, unpredictable. It is exhausting, unending, and always a little bit dangerous. It is profoundly human.

But it's worth remembering what that *humanity* looked like inside search results. Rand Fishkin, the founder of the software company SparkToro, who has been writing and thinking about search since 2004, believes that Google has gotten better at not amplifying conspiracy theories and hate speech, but that it took the company far too long. "I don't know if you searched for holocaust information between 2000 and 2008, but deniers routinely showed up in the top results," he told me. The same was true for Sandy Hook hoaxers—in fact, campaigns from the Sandy Hook families to fight the conspiracy theories led to some of the search engine's changes. "Whenever somebody says, 'Hey, Google doesn't feel as human anymore,' all I can say is that I bet they don't want a return to that," Fishkin said.

Google Search might be worse now because, like much of the internet, it has matured and has been ruthlessly commercialized. In an attempt to avoid regulation and be corporate-friendly, parts of it might be less wild. But some of what feels dead or dying about Google might be our own nostalgia for a smaller, less mature internet. Sullivan, the Search liaison, understands this longing for the past, but told me that what feels like a Google change is also the search engine responding to the evolution of the web. "Some of that blog-style content has migrated over time to closed forums or social media. Sometimes the blog post we're hoping to find isn't there." Sullivan believes that some of the recent frustrations with Google Search actually reflect just how *good* it's become. "We search for things today we didn't imagine we could search for 15 years ago and we believe we'll find exactly what we want," he said. "Our expectations have continued to grow. So we demand more of the tool." It's an interesting, albeit convenient, response.

[From the July/August 2008 issue: Is Google making us stupid?](#)

Google has rewired us, transforming the way that we evaluate, process, access, and even conceive of information. "I can't live without that stuff as my brain is now conditioned to remember only snippets for Google to fill in," one Reddit user [wrote](#) while discussing Brereton's "Google Is Dying" post. Similarly, Google users shape Search. "The younger generation searches really differently than I do," Haynes told me. "They basically speak to Google like it's a person, whereas I do keyword searching, which is old-school." But these quirks, tics, and varying behaviors are just data for the search giant. When younger generations intuitively start talking to Google like it's a person, the tool starts to anticipate that and begins to behave like one (this is part of the reason behind the rise of humanized AI voice assistants).

Fishkin argues that Google Search—and many of Google's other products—would be better with some competition and that Search's quality improved the most from 1998 to 2007, which he attributes to the company's need to compete for market share. "Since then," he said, "Google's biggest search innovation has been to put more Google products up front in results." He argues that this strategy has actually led to a slew of underwhelming Google products. "Are Google Flights or Google Weather or Google's stocks widget better than competitors? No, but nobody can really compete thanks to the Search monopoly."

"Is Google Search dying?" is a frivolous question. We care about Search's fate on a practical level—it is still a primary way to tap into the internet's promise of unlimited information on demand. But I think we also care on an existential level—because Google's first product is a placeholder to explore our hopes and fears about technology's place in our life. We yearn for more convenience, more innovation, more possibility. But when we get it, often we can only see what we've lost in the process. That loss is real and deeply felt. It's like losing a piece of our humanity. Search, because of its utility, is even more fraught.

Most people don't want their information mediated by bloated, monopolistic, surveilling tech companies, but they also don't want to go all the way back to a time before them. What we really want is something in

between. The evolution of Google Search is unsettling because it seems to suggest that, on the internet weâve built, thereâs very little room for equilibrium or compromise.

GOOGLE IS DESTROYING INVENTORS AND AMERICAN INNOVATION

Google Is Posing A Serious Threat To Innovation

[Frank V. Vernuccio, Jr.](#)

Noah Loverbear via Wikimedia Commons

For years, Google has functioned as the world's digital commons—a place where users aggregate, store, and search for publicly-available knowledge. It's served as a hub for internet activity and a portal through which people can access the collective understanding of mankind.

Without a doubt, Google takes its role in society quite seriously. From its longstanding effort to [digitize](#) libraries to its most recent attempt to [collect](#) and log medical records, Google has worked tirelessly to create a common feast of information that anyone can access.

But increasingly, Google's open-source approach to information sharing is creating far more problems than solutions. And nowhere is this fact more clearly illustrated than within the intellectual property (IP) sphere. Google's notably lax approach to IP has thrown the entire copyright industry into chaos. Moreover, it has resulted in perhaps the most influential IP lawsuit in decades: [Google v. Oracle](#).

Granted review by the nation's highest court, the Supreme Court is currently being flooded by a wave of Amicus Briefs on the issue. But individual and corporate interests aside, the upcoming Supreme Court case reflects an unfortunate truth about Google's approach to intellectual property. Rather than contribute to the greater good, the company's common feast position on IP is leaving innovators to starve.

The case revolves around a years-old incident that occurred between Oracle—the owner of Java, a programming language and computing platform first released by Sun Microsystems in 1995—and Google. Instead of purchasing a licensing agreement from Oracle to use the Java software, Google chose to copy a substantial portion of the program's code to use within its own mobile phone software, Android. Then, as Google is wont to do, the company made the operating system open source, allowing phone carriers and app developers to utilize the operating system without cost.

The only problem: that intellectual property wasn't theirs to give away. Oracle stated as much when it sued Google for copyright infringement. But, in its January 2020 [brief](#) to the Supreme Court, Google disagreed. It argued that its replication of the code constituted a fair use, an argument that had been previously rejected by both the Trump administration and the lower courts. But Google wasn't deterred. Instead, it has continued to argue that its reuse of the Java code, and the subsequent creation of Android, benefitted the greater good and that, in effect, justifies the code's replication.

According to Google, the search engine company was once again adding to the common feast of public information and their replication of Oracle's copyrighted code merely contributed to that process. That perspective, however, illustrates precisely why Google's approach to IP is so dangerously misguided.

In short, Google's common feast position is incompatible with intellectual property rights. Much like the [tragedy of the commons](#) thought experiment, the common feast approach to IP would rob any incentive for innovators to produce. As a result of Google's perspective, software code that could benefit the public domain could lose its intellectual property protections. But those protections are the very reason innovation occurs in the first place. Without security against IP theft, progression would slow to a halt, and ironically, the public would suffer as a result.

The potential impact is not confined to software alone, either. The expansion of the fair use doctrine that Google seeks threatens any creative content, including advertising material, customer reviews, product descriptions, photographs, destination guides, and more. Other businesses may benefit from sharing and placement of their content on a variety of online platforms, but as the content owners, they should not have to give up control of whether, when, and how they allow their content to be used.

Ultimately, Google's approach to IP is antithetical toward the spirit of innovation. It would strip away not only the legal protections afforded to one's labors, but also the very rationale to labor in the first place. Indeed, Google's argument in *Google v. Oracle* is a dangerous proposition that must be rejected. The company may pride itself in its role in the digital commons, but its common feast perspective would certainly not benefit the greater good.

Frank V. Vernuccio, Jr., J.D., is the president of the American Analysis of News & Media, Inc., and the editor-in-chief of its major publication, the New York Analysis of Policy and Government.

GOOGLE IS GROUND-ZERO FOR SEX ABUSE, SEX-EXTORTION AND PERVERSION

- Gay and Straight Orgies, Hookers, Rent-Boys And Sex-For-Jobs

[Google reportedly paid Android creator millions after sex misconduct claim | Updated](#)

[Google fired 48 people for sex harassment in last two years](#)

['Panty-stuffing' cop transferred to different precinct](#)

[Pro skateboarder suspended after allegations he sexually abused 14-year-old girl](#)

[Husband of 'panty-stuffing' cop says allegations are bogus](#)

Google is about to pay Andy Rubin, the creator of Android, the last installment of his \$90 million exit package—a golden parachute he received despite his being credibly accused of coercing a female employee into performing oral sex, it was revealed on Thursday.

In addition to claims the legendary software developer coerced a colleague to perform oral sex on him in a hotel room, Rubin had multiple extramarital affairs with colleagues and had bizarre ownership relationships with other women to whom he paid hundreds of thousands of dollars, according to an explosive report.

Google is shelling out a \$90 million exit package to Rubin despite the fact that the search giant had investigated the woman's claims and found them credible, two company execs [told The New York Times](#).

Instead of firing Rubin and paying him a goodbye pittance, Google began paying him \$2 million a month for four years, with the last payment scheduled for next month, sources with knowledge of the terms told the paper.

Google Chief Executive Sundar Pichai, in a Thursday memo to employees, said the Times story was hard to read. He didn't deny any of what was reported, and further admitted to startling harassment stats at the company.

In the last two years, 48 people have been terminated for sexual harassment, including 13 who were senior managers and above, Pichai said in the memo, obtained by CNBC, which was also signed by Eileen Naughton, vice president of people operations. None of these individuals received an exit package.

A Google spokeswoman said in a statement that the company takes harassment seriously.

Over the past decade, two other senior execs were protected from public scandal and other repercussions and in one instance paid a multimillion-dollar exit package after being accused of sexual misconduct, the

paper said, without naming the execs.

The generous goodbyes allowed Google to avoid costly, potentially embarrassing legal battles, the paper noted.

In the third instance, the exec was allowed to remain in a highly compensated position at Google despite sexual harassment allegations, the paper said, citing corporate and court documents plus interviews with anonymous company sources.

Rubin's accuser, whose name was not revealed, had been in an extramarital relationship with him when he coerced her to perform oral sex on him in 2013, two execs told the paper.

Rubin, 55, met his wife at Google but dated other women at the company while they were together. In 2011, he had an affair with a woman on the Android team against company rules.

In a lawsuit filed this month by his ex-wife, Rie Rubin, she claimed he had multiple ownership relationships with other women during their marriage, paying hundreds of thousands of dollars to them.

The couple were divorced in August.

The suit included a screenshot of an August 2015 e-mail Andy Rubin sent to a woman. "You will be happy being taken care of," he wrote. "Being owned is kinda like you are my property, and I can loan you to other people."

Report: Google Protects Male Executives Accused of Sexual Misconduct

Rob

Kim/Getty Images 25 Oct 2018 [1526](#)

4:47

A new report from the *New York Times* alleges that the Silicon Valley Masters of the Universe at Google protected executives accused of sexual misconduct for years, even keeping an executive's mistress on the payroll.

A report from the *New York Times* titled "How Google Protected Andy Rubin, the 'Father of Android'" [outlines](#) how the progressive tech giant Google protected three executives that were accused of sexual misconduct for more than a decade. The article notes that Andy Rubin, the creator of the Android mobile operating system, left the company in October and was given a

â heroâ s farewellâ by executives at the company.

Larry Page, Googleâ s chief executive, commented on

Rubinâ s departure in a statement saying: â I want to wish Andy all the best with whatâ s next. With Android he created something truly remarkable â with a billion-plus happy users.â The *New York Times* notes that in their farewell to Rubin, the company failed to mention that Rubin was leaving the company after a claim of sexual assault by a Google employee with whom Rubin had been having an extramarital relationship.

The article states:

What Google did not make public was that an employee had accused Mr. Rubin of sexual misconduct. The woman, with whom Mr. Rubin had been having an extramarital relationship, said he coerced her into performing oral sex in a hotel room in 2013, according to two company executives with knowledge of the episode. Google investigated and concluded her claim was credible, said the people, who spoke on the condition that they not be named, citing confidentiality agreements. Mr. Rubin was notified, they said, and Mr. Page asked for his resignation.

Google could have fired Mr. Rubin and paid him little to nothing on the way out. Instead, the company handed him a \$90 million exit package, paid in installments of about \$2 million a month for four years, said two people with knowledge of the terms. The last payment is scheduled for next month.

Even more worrying is the fact that this is not the first time that Google has covered up for an executive accused of sexual misconduct. The article goes on to say:

Mr. Rubin was one of three executives that Google protected over the past decade after they were accused of sexual misconduct. In two instances, it ousted senior executives, but softened the blow by paying them millions of dollars as they departed, even though it had no legal obligation to do so. In a third, the executive remained in a highly compensated post at the company. Each time Google stayed silent about the accusations against the men.

Notably, former Google and (later parent company) Alphabet Executive Chairman Eric Schmidt is revealed in the article to have kept his mistress on the payroll as a â company consultant.â Schmidt has been a long-time supporter of Hillary Clinton and even expressed interest in being â head outside advisorâ to [Clintonâ s 2016 presidential campaign](#).

Google, founded in 1998 by Mr. Page and Sergey Brin when they were Stanford University graduate students, fostered a permissive workplace culture from the start.

In Silicon Valley, it is widely known that Mr. Page had dated Marissa Mayer, one of the companyâ s first engineers who later became chief executive of Yahoo. (Both were single.) Eric Schmidt, Googleâ s former chief executive, once retained a mistress to work as a company consultant, according to four people with knowledge of the relationship. And Mr. Brin, who along with Mr. Page owns the majority of voting shares in Googleâ s parent, Alphabet, [had a consensual extramarital affair](#) with an employee in 2014, said three employees with knowledge of the relationship.

David C. Drummond, who joined as general counsel in 2002, had an extramarital relationship with Jennifer Blakely, a senior contract manager in the legal department who reported to one of his deputies, she and other Google employees said. They began dating in 2004, discussed having children and had a son in 2007, after which Mr. Drummond disclosed their relationship to the company, she said.

Google then took action. Ms. Blakely said Stacy Sullivan, then the head of human resources and now chief culture officer, told her that Google discouraged managers from having relationships with subordinates.

“One of us would have to leave the legal department,” Ms. Blakely said. “It was clear it would not be David.”

While Google has spent a lot of time in the past few years [virtue signaling](#) how woke and progressive they are as a company, it seems that some of the company’s executives have been taking part in a number of activities that would see most fired immediately. Instead, the progressive Silicon Valley tech giant chose to protect these individuals.

GOOGLE IS ONE BIG LIE

SECRETLY GAY TECH CEOâ€™S RUN ALMOST THE ENTIRE ANTIFA PROGRAM

Tech Goes From White House to Doghouse in Trump's Washington

By Todd Shields, Mark Bergen, and Ben Brody

- Google, Facebook under scrutiny on size, political inclination
- Issues include fake news, net neutrality and search results

President Donald Trump is finding relations with business leaders strained as he disband his CEO advisory councils in the wake of his reaction to last weekend's violence in Virginia. Bloomberg's Kevin Cirilli reports on 'Bloomberg Daybreak: Americas.' (Source: Bloomberg)

Follow [@bpolitics](#) for all the latest news, and [sign up](#) for our daily Balance of Power newsletter.

Google once had Barack Obama's ear, served as a revolving door for White House staff and saw its political agenda advance. In Donald Trump's Washington, some conservatives say it's gotten so powerful it should be regulated like a public utility.

Google is not alone in a fall from grace. Tech companies -- including [Facebook Inc.](#) and Amazon.com Inc. -- that were previously lauded as innovators are facing increased scrutiny over their size, their hiring practices and whether online news feeds skew liberal.

[Follow the Trump Administration's Every Move](#)

"The mood in Washington, at least on the right side of the aisle, is more critical of companies like Google and Amazon," said Fred Campbell, a former Republican FCC aide and director of [Tech Knowledge](#), which promotes market-based policies.

The shift in tone comes as Congress and the Trump administration consider changing tax, energy and immigration policies important to Silicon Valley. A regulation that protects data flows is already slated for gutting by the Federal Communications

Commission, and, in Congress, a law has been proposed that would bring internet companies under a privacy regulator. Another would increase legal liability for website operators as a way to combat online sex trafficking.

Meanwhile, tech's made no secret of its distaste for Trump policies. [Alphabet Inc.](#)'s Google, [Apple Inc.](#) and Facebook issued critical statements after the president [proposed](#) a ban on transgender people in the military, stepped away from the Paris climate accords and issued a ban on travel from majority Muslim nations.

Advisory Councils

The Aug. 12 street violence in Charlottesville, Virginia, provoked another rift. After the president said ["both sides"](#) shared blame for the fighting, Apple Chief Executive Officer Tim Cook told his staff he disagreed with Trump. So many executives, including Intel Corp.'s Chief Executive Officer Brian Krzanich, quit White House advisory councils last week in protest that Trump ended up disbanding them.

Amazon is doing great damage to tax paying retailers. Towns, cities and states throughout the U.S. are being hurt - many jobs being lost!

â Donald J. Trump (@realDonaldTrump) [August 16, 2017](#)

Amid the turmoil, Trump unloaded on Amazon, tweeting that the company is hurting other retailers, and causing shares in the online retailer to fall. ["Towns, cities and states throughout the U.S. are being hurt - many jobs being lost!"](#) Trump said in the tweet.

It was the latest conservative broadside on the technology companies over their size, influence and promotion of social policies on immigration, transgender rights and other matters.

[More: Trump Says in Tweet Amazon Does "Great Damage" to Retailers](#)

Oregon Republican Representative Greg Walden, the chairman of the Energy and Commerce Committee, challenged tech and broadband executives to appear next month as his committee considers undoing the Obama-era net neutrality rules that Silicon Valley supports. In what could be interpreted as a snub, executives didn't respond to the invitation by the deadline -- which has been extended.

â Republicans have always been fine with most of tech, because Republicans have usually defaulted pro-business," said Bruce Mehlman, a Republican lobbyist and former Commerce Department official said in an interview. ["This is less about any one issue and more about the new populist wing of the Republican party -- populism is suspicious of bigness, and the biggest companies now are tech."](#)

In this atmosphere, public-policy asteroids can strike suddenly and dent tech's image in the capital. Google [dismissed](#) James Damore, an engineer who wrote about gender differences [and said](#) the company had a ["left bias"](#) that silenced dissenters. Washington noticed.

[Why Republicans Want to Nix U.S. Net Neutrality Rules: QuickTake](#)

â The mistreatment of conservatives and libertarians by tech monopolies is a civil rights issue,â Representative Dana Rohrabacher said in a tweet using the hashtag #googlememo. The California Republican is concerned tech giants may be excluding top talent for political reasons, said his spokesman, Ken Grubbs.

Trump adviser Kellyanne Conway tweeted an op-ed that Damore wrote in the Wall Street Journal about his firing, in which he called Google â ideologically driven and intolerant of scientific debate and reasoned argument.â

Fox Newsâ s Tucker Carlson said Damoreâ s dismissal showed Google couldnâ t be trusted, for instance in ways its algorithms determine [where to rank](#) fake news when returning search results. â Google should be regulated like the public utility it is, to make sure it doesnâ t further distort the free flow of information to the rest of us,â Carlson said on his [Aug. 14 show](#).

Others on the right are sounding similar themes. Dominant companies such as Facebook, [Twitter Inc.](#) and Google â represent themselves as politically neutral while systematically promoting liberal views and limiting or even banning conservatives,â Phil Kerpen, head of the American Commitment policy group said in a memo urging congressional action that was obtained by Bloomberg News.

[Why Googleâ s Gender Struggle Echoes Across Tech: QuickTake](#)

Kerpen advocated â clear disclosure of how traffic is treatedâ and â enforcement actions if they violate those representations,â according to his memo. Kerpen, a strategist who has worked for groups including the billionaire [Koch brothers](#)â [Americans for Prosperity](#), didnâ t return phone calls and emails.

Amazon has become a target at least in part because of its size. The company with about 70 percent of all e-book sales and 30 percent of all U.S. e-commerce [drew criticism](#) from Trump that had started on the campaign trail when Trump said in February 2016: â Believe me, if I become president, do they have problems. Theyâ re going to have such problems.â Trumpâ s also objected to coverage by the [Washington Post](#), which is owned by Amazonâ s Chief Executive Officer Jeff Bezos, for instance [calling](#) the newspaper "FAKE NEWS" in a June tweet.

In July, a Democratic lawmaker from Rhode Island, David Cicilline, [called for](#) hearings on the online retailerâ s proposed purchase of grocer [Whole Foods Market Inc.](#) Experts and analysts have largely dismissed antitrust threats, in part because the food-store chain has just 1.6 percent of the U.S. grocery market, according to Euromonitor.

[Trump, Tech Clash Over Visas for Skilled Immigrants: QuickTake](#)

Democrats in their â Better Dealâ package of [policy proposals](#) released in July called for tougher merger reviews. Regulators must â must explicitly consider the ways in which control of consumer data can be used to stifle competition or jeopardize consumer privacy,â according to the proposals.

Tech companies are spending more to make their case in the new Washington, and staffing up for better footholds in the Trump administration. Google hired Max Pappas, a veteran of Texas Republican Senator Ted Cruzâ s office and the libertarian

FreedomWorks PAC.

Google boosted its lobbying expenditure to \$9.5 million in the first half of this year, a nearly 18 percent increase from about \$8 million a year earlier, according to disclosure filings. Facebook's first-half lobbying expenditures rose too, by about 12 percent to \$5.6 million from almost \$5 million. Amazon spent \$6.1 million, up from \$5.7 million for the same period a year earlier.

Immediate challenges for Silicon Valley include the move by FCC Chairman Ajit Pai, a Republican chosen by Trump, to weaken the Obama-era net neutrality rule that forbids broadband providers from blocking or slowing web traffic, for instance in order to give their video an edge over rivals' programming.

Representative Marsha Blackburn, the Tennessee Republican who leads the House communications subcommittee, at a July 25 hearing took issue with the role played by web companies during an earlier [online protest](#) of Pai's plans.

“Internet giants Amazon, Facebook and Google recently joined with websites such as Pornhub and dark money groups Fight for the Future, [Demand Progress](#) and Free Press for a day of action to claim Republicans would break the net,” Blackburn said. “Let me be clear -- Republicans have always supported a free and open internet.”

Blackburn has introduced a bill to bring web companies and broadband providers alike under one privacy regulator. The Internet Association representing companies including Google and Facebook [objected](#), saying the measure “has the potential to upend the consumer experience online and stifle innovation.”

Representative Walden called on the top executives of Facebook, Alphabet, Amazon, online video provider [Netflix Inc.](#) and others to appear before his committee at a Sept. 7 hearing on internet governance.

“It's time they came before us and directly shared their positions,” Walden said.

Google, Facebook, Netflix and Amazon didn't respond to emailed requests for comment or declined to comment. AT&T Inc. said it was checking the schedule of Chief Executive Officer Randall Stephenson; [Charter Communications Inc.](#), Comcast Corp. and [Verizon Communications Inc.](#) didn't publicly respond.

With assistance by Bill Allison, and Mark Gurman

Silicon Valley Isn't Special

Tech has plenty of reasons to pretend it's an industry of upstarts. That facade is crumbling.

byConor Sen

9

"Better to be a pirate than join the navy," Steve Jobs said. Times have changed.

Photographer: Photographer: David Paul Morris/Bloomberg

Silicon Valley has a perception problem. Steve Jobs once said, speaking about the irreverent culture he helped create, that "[it's better to be a pirate than join the navy](#)." This ethos served the community well when its firms existed at "pirate scale." But now Silicon Valley's most successful companies have become some of the largest in the world. This culture must accept that it has become the navy, with its remaining pirates facing a choice -- enlist, or walk the plank.

Perhaps no company is struggling with this reality more than Google. Founded in 1998, the company famously adopted the motto "[Don't be evil](#)" around the year 2000. Ever since, whenever the company has run into controversy, such as [its censorship disputes with China](#), or its recent decision to [fire the author](#) of a controversial 10-page memo, critics have lashed out at the company over its betrayal of its founding values.

But it's not fair to hold Google, or its parent company Alphabet, to the same principles it adopted when it was a relatively inconsequential technology startup. In the year 2000, when it adopted "Don't be evil," Google had revenue of [just over \\$19 million](#). In 2017, it will have revenue of over \$100 billion. That's higher than the gross domestic product of [a dozen states](#). Google [dropped](#) the "Don't be evil" motto in 2015.

Google is by no means alone in being a large technology company struggling to balance historical "pirate" cultures with growing responsibilities as powerful corporations. Facebook has gotten in trouble for allowing "fake news" on its platform, influencing the 2016 election. Twitter has struggled with harassment and hate groups. And Uber has clashed with regulators, its drivers, and the impact of its internal culture on women.

Silicon Valley has a lot of self-interested reasons for preferring to maintain a facade that its culture is special, and that its industry is more innovative, virtuous and productive than every other industry. It serves as a great recruiting tool as the region competes for talent with other industries and areas. It allows insiders to maintain outside control of their companies. And it is a way to prevent regulators from coming in and regulating Silicon Valley to the extent that it might otherwise seek to do.

But it's time to drop the pretense that Silicon Valley deserves special treatment. Facebook and Google are content and advertising companies, digital evolutions of print and television companies that came before them. Amazon's core e-commerce business is just a digital Wal-Mart. Apple's iPhone product cycle, with its annual incremental improvements, has parallels to the personal computer industry in the 1990s or even the Detroit "Big Three" automakers in the 1960s. They deserve the same scrutiny from regulatory and labor watchdogs that their old-economy peers get.

They shouldn't have multiple classes of shares that deprive investors of voting rights. Tesla and Amazon both show that investors are willing to look past a lack of near-term profitability if they believe in a company's vision. As Snap, the latest IPO that has fizzled, may be showing, when a hot growth story turns cold and investors lack voting rights, there's no opportunity for an activist or turnaround investor to come in and pressure management.

Clear thinking from leading voices in business, economics, politics, foreign affairs, culture, and more.

And employees should stop thinking that working for a large technology company is fundamentally different from working anywhere else. Despite what Silicon Valley would like you to believe, employees at Google and Facebook should have the same expectations that workers at Goldman Sachs, General Electric or McKinsey have in terms of adequate staffing of human resources departments and what is considered acceptable speech at work.

Uber's CEO search, with leaders of "stodgy" companies having been floated as possible successors -- Meg Whitman of HP, and Jeffrey Immelt, formerly of GE -- shows that even the bad boy of tech may be getting the message. The sooner the whole industry wises up, the better.

['The French March Well, We Fight Well': Col. Peters Rejects Trump Military Parade Plan](#)

In the latest installment in his investigation into how Silicon Valley is clandestinely interacting with Americans, Tucker Carlson sent a reporter around the District of Columbia to see how Google was tracking him.

Carlson sent Fox News Headlines 24/7 anchor Brett Larson to several major landmarks in Washington, from the Fox News bureau on North Capitol Street, to the Children's Hospital in the north, the Washington National Cathedral in the northwest and back to Capitol Hill.

Carlson said his previous report revealed Google applied for two patents, one of which reportedly allows them to effectively "stick a camera in your bedroom and spy on you and your children."

He said Google uses information like that for "surveillance capitalism" - selling advertisements for stuff based on your activities, locations and characteristics.

Carlson sent Larson out and about to find out how much Google gleans from Android devices.

With no SIM card in either of two phones and one set on Airplane Mode, Larson took a black car around town.

During that time, he was not connected to WiFi and only took photos at the cathedral.

Back at the Fox News Channel bureau, Larson hooked the phones up to a device that copied the data the phones sent to Google.

He found it knew exactly where he was throughout the day.

"It knows when I got out of the car!" he exclaimed, examining metadata in the report.

He and Carlson discussed how complicated user agreements allow users to sign away their privacy "for nothing."

Google responded to Carlson's team by saying the user could "opt out" of location history, which is reportedly a complicated process.

"You're probably not the customer, you're the product," Carlson remarked of people who use such free software.

GOOGLE IS RUN BY CHILD SEX PERVERTS

Google whistleblower claims tech giant's Developer Studio division has been infiltrated by 'pedophilic religious doomsday cult' Fellowship of Friends that was featured in a Spotify podcast series called 'Revelations' last year

- Kevin Lloyd, 34, was a video producer for Google Developer Studio from 2017 until he was fired in February 2021
- Lloyd in August 2021 filed a lawsuit at California Superior Court alleging that he lost his job because he questioned a 'cult' that many of his colleagues joined
- Earlier this month Lloyd wrote a Medium post about his time at Google, and his concerns about Fellowship of Friends
- Google insist that they are unaware of a person's religious beliefs during hiring; Lloyd says they know about the influence of the cult, but turn a blind eye

By [Harriet Alexander](#)

[View comments](#)

An apocalyptic 'cult' led by an eccentric misogynist accused of sexual abuse of young men has taken over a division of [Google](#), a whistleblower has claimed.

Kevin Lloyd, 34, claims that he was fired from his job as a video developer at Google last year because he began questioning the influence of the cult.

In August, Lloyd filed a discrimination case in [California](#)'s Superior Court, alleging he was fired for digging into Fellowship of Friends - a group based in the small Californian town of Oregon House, and whose members made up a large percentage of employees in his division.

'Plaintiff's preliminary research into Oregon House and the Fellowship of Friends described the Fellowship as a destructive cult, with a pedophilic leader who makes false prophecies about the end of the world,' the lawsuit claims.

'Plaintiff became alarmed that Google was involved with and/or financially supporting such an organization.'

Earlier this month, Lloyd wrote a lengthy description of his case on [Medium](#), and spoke to The [New York Times](#) - who corroborated many of the lawsuit's claims through interviews with eight current and former employees of the Google business unit.

•

Kevin Lloyd, 34, claims he lost his job at Google because he raised concerns about how many people within the Google Developer Studio were affiliated with Fellowship of Friends

-

Google's campus in Mountain View is 180 miles from the small town of Oregon House, population 1,250 - yet half of the people Lloyd met were from Oregon House, he said

Lloyd said he began work at Google in 2017, as part of Google Developer Studio (GDS) - the tech giant's internal production company, making adverts and video content.

He said it slowly dawned on him that many of the people he met at GDS were from the same small Californian town, 180 miles north of Google's Silicon Valley home, in Mountain View.

The town of Oregon House is home to 1,250 people, and yet Lloyd said he realized that half of the 25 people he met at GDS were from the same town.

Lloyd said he noticed that many of the outside vendors, such as caterers and entertainers at corporate events, were also from Oregon House.

In 2018, Lloyd said, he was speaking to a freelancer who was working with them that day, and was from a town near Oregon House.

Lloyd recalls the freelancer telling him: 'Oregon House isn't a town. It's a cult.'

He began investigating the freelancer's claim, and said he was shocked by what he found.

'There are online support groups for former Fellowship of Friends members to help them process the trauma endured during their membership, as well as problems that arise after leaving,' Lloyd's lawsuit states.

Fellowship of Friends, which is based in Oregon House, was founded in 1970 by Robert Earl Burton, a former school teacher in the San Francisco Bay area.

'From its inception the vision of the Fellowship was, and remains, to establish a practical spiritual organization and to make it available to anyone interested in pursuing the spiritual work of awakening,' they state on their website.

•

Robert Earl Burton, now believed to be around 83, founded Fellowship of Friends in 1970. He has been accused in multiple lawsuits of sexual abuse

•

Burton is seen with a European artwork purchased with the organization's cash. Members must give 10 percent of their earnings to the group

Burton, believed to be now aged in his early 80s, sought to create a center celebrating the fine arts - with opera, ballet, works of art and literature the focus.

He based his organization in Oregon House, and created a winery where his devotees worked, when not studying the arts.

Google even purchased wine, the lawsuit claims, from the Grant Marie Winery, an allegedly cult-affiliated vineyard run by a Fellowship member in Oregon House.Â

But critics claimed that he had sexually abused new members of his group - in particular young boys.

In 1984 a former member filed a \$2.75 million lawsuit claiming that young men who joined the organization 'had been forcefully and unlawfully sexually seduced by Burton,' according to documents obtained by [The New York Times](#).

In 1996, another former member accused Burton in a law suit of sexual misconduct with him while he was minor.Â Both suits were settled out of court.

Some accusers, Lloyd alleged, had been flown to the country under false pretenses and then abused.

•

Members of Fellowship of Friends are seen with Burton (left, in pale blue suit) holding a meeting

What is Fellowship of Friends?

Founded on January 1, 1970 by San Francisco school teacher Robert Earl Burton, Fellowship of Friends is a non-profit religious organization, headquartered in Oregon House, California.

Burton based his faith system on a philosophy called the Fourth Way, founded by an Armenian philosopher and mystic, George Gurdjieff, who lived from 1866 to 1949.Â

Burton adopted Gurdjieff's believe that people are in a hypnotic 'waking sleep', and need to work on themselves through studying art, music and literature.

He named his 1,200-acre headquarters Apollo, and his 1,800 followers gave 10 percent of their earnings to the organization - which spent the money on art, fine wine and culture.Â

Critics have filed lawsuits claiming sexual abuse.

Advertisement

Other critics said that the group was strongly anti-women, and celebrated white European men above all.

In September, investigative journalist Jennings Brown published a six-part podcast produced for Spotify, entitled [Revelations](#).

Brown had spent three years from 2018 digging into the group, and documented allegations of sexual abuse in what he termed a 'doomsday cult'.

Lloyd said he was aghast that GDS was so strongly linked to the Fellowship, with GDS's director, Peter Lubbers, described as a longtime member of the group, who joined shortly after he moved to the U.S. from the Netherlands.

Lubbers introduced a video producer named Gabe Pannell to the Fellowship: Pannell was pictured with Burton in 2015, and described as a 'new student', The New York Times report.

Lloyd's lawsuit states: 'Mr Lubbers gained status and praise relative to the increase of money flowing to the Fellowship through his efforts at Google that put (and kept) other Fellowship members directly or indirectly on Google's payroll.'

Lubbers insisted faith had nothing to do with his hiring.

'My personal religious beliefs are a deeply held private matter,' Lubbers told The New York Times.

'In all my years in tech, they have never played a role in hiring. I have always performed my role by bringing in the right talent for the situation - bringing in the right vendors for the jobs.'

Pannell told the paper that those hired were brought in from 'a circle of trusted friends and families with extremely qualified backgrounds'.

Lloyd, in his Medium post - which does not name Lubbers or Pannell - said that anxiety about the Fellowship, and its reputation, sparked a panic attack, for which he was admitted to ER.

He said in his court documents that he worried events he produced 'could somehow be used to funnel money back into the Fellowship of Friends.'

•

Burton is seen in a 1981 photo at Oregon House. In 1984, a former member filed a \$2.75 million lawsuit claiming that young men who joined the organization 'had been forcefully and unlawfully sexually seduced by Burton,' according to documents obtained by The New York Times. The suit was settled out of court

Fired in February 2021, he has retained a lawyer who previously represented a woman at Lubbers' previous company, Kelly Services, and sued in 2008 in a similar case.

Lynn Noyes claimed that Kelly Services had failed to promote her because she was not a member of the Fellowship.

A California court awarded her \$6.5 million in damages.Â

'Anyone outside of the Fellowship is seen as somehow inferior and at times adversarial,' Lloyd's lawsuit says.

Â 'Those that express serious concerns, criticism or question the group may be eventually perceived as enemies.'Â

Google told The New York Times that they were barred by law from inquiring about someone's religious practices during the hiring process.

'We have longstanding employee and supplier policies in place to prevent discrimination and conflicts of interest, and we take those seriously,' a Google spokeswoman, Courtenay Mencini, said in a statement.

'It's against the law to ask for the religious affiliations of those who work for us or for our suppliers, but we'll of course thoroughly look into these allegations for any irregularities or improper contracting practices.

'If we find evidence of policy violations, we will take action.'Â

Fellowship of Friends was approached for comment.

GOOGLE IS THE #1 ANTI-TRUST VIOLATOR ON EARTH

By [Hamza Shaban](#) ¶

The social media site Gab.ai [is accusing Google](#) of violating federal antitrust laws when the tech giant booted Gab from the Google Play Store, according to lawsuit filed Thursday. The legal action is the latest salvo in an [escalating battle](#) between right-leaning technologists and leaders against Silicon Valley giants such as Facebook and Google.

Gab alleges in the lawsuit that “ Google deprives competitors, on a discriminatory basis, of access to the App Store, which an essential facility or resource.”

“ Google is the biggest threat to the free flow of information,” Gab chief executive Andrew Torba said in a statement. “ Gab started to fight against the big tech companies in the marketplace, and their monopolistic conduct has forced us to bring the fight to the courtroom.”

oogle banned the social media platform from the Google Play Store last month, citing violations of Google's hate speech policies. Andrew Anglin, the founder of the neo-Nazi website [The Daily Stormer](#), had become an active user on Gab after a succession of companies refused to service his site. Gab also counts other controversial right-wing figures among its users, including [Milo Yiannopoulos](#) and Andrew “ weev” Auernheimer.

Gab has raised more than \$1 million in contributions since July, according to the complaint.

Gab filed its complaint in U.S. District Court for the Eastern District of Pennsylvania. The company said it moved to Pennsylvania this month.

Lawsuit accuses Google of bias against women in pay, promotions

[Daniel Wiessner](#)

•

The Google logo is pictured atop an office building in Irvine, California, U.S. August 7, 2017.
REUTERS/Mike Blake

(Reuters) - Three female former employees of Alphabet Inc. (GOOGL.O) Google filed a lawsuit on Thursday accusing the tech company of discriminating against women in pay and promotions.

The proposed class action lawsuit, filed in California state court in San Francisco, comes as Google faces an investigation by the U.S. Department of Labor into sex bias in pay practices.

The lawsuit appears to be the first to make class action sex bias claims against Google, but is only the latest instance of a major tech company being accused of discriminating against women.

The Department of Labor sued Oracle America Inc in January, claiming it paid white men more than women and minorities with similar jobs. Microsoft Corp (MSFT.O) and Twitter Inc (TWTR.N) are facing sex bias lawsuits, and Qualcomm Inc (QCOM.O) last year settled claims for \$19.5 million.

Meanwhile, Uber Technologies Inc in June said it would make a series of changes after a former engineer in a blog post accused the ride-hailing service of condoning rampant sexism.

The plaintiffs in Thursday's lawsuit are a former Google software engineer, a former communications specialist and a former manager who worked in various roles at the Mountain View, California-based company. They say Google pays women in California less than men who perform similar work, and assigns female workers jobs that are less likely to lead to promotions.

While Google has been an industry-leading tech innovator, its treatment of female employees has not entered the 21st century, Kelly Dermody, a lawyer for the women, said in a statement.

Google spokeswoman Gina Scigliano denied the claims in a statement. She said employment decisions are made by hiring and promotion committees, and are vetted to make sure there is no gender bias.

If we ever see individual discrepancies or problems, we work to fix them, because Google has always sought to be a great employer, for every one of our employees, she said.

The plaintiffs say Google violated California laws requiring equal pay for similar work and prohibiting unfair and unlawful business practices. They are seeking to represent a class of women who worked at Google in California over the last four years.

The Labor Department investigation stems from a 2015 audit in which the department says it discovered sex-based wage gaps among Google workers.

The department last month appealed an administrative judge's July decision that rejected its request for contact information for more than 20,000 Google employees.

Google disables offensive ad keywords found by BuzzFeed

Reuters Staff

2 Min Read

•

The Google app logo is seen on a smartphone in this picture illustration taken September 15, 2017.
REUTERS/Dado Ruvic/Illustration

(Reuters) - Alphabet Inc.'s Google said it had disabled a "majority" of the offensive keywords that BuzzFeed found could be used by advertisers to target people searching for racist and anti-Semitic topics.

Google, the world's biggest advertising platform, not only allowed advertisers to target searches such as "Why do Jews ruin everything" but also suggested the user to run ads next to searches such as "the evil jew" and "jewish control of banks", a campaign by BuzzFeed discovered. (bzfd.it/2x2HX4H)

The ads were visible when such keywords were searched for and Google's ad buying platform tracked the ad views, according to the internet media company's report based on the campaign.

Google disabled the keyword searches used in the campaign after BuzzFeed's inquiry, except an exact match for "blacks destroy everything", the report said.

"We've already turned off these suggestions and any ads that made it through, and will work harder to stop this from happening again," Google's senior vice president of ads Sridhar Ramaswamy said in an email.

The news comes a day after Facebook Inc said it was temporarily disabling the ability of advertisers to target based on people's self-reported education and job information after a report that those features allowed targeting based on anti-Semitic topics.

GOOGLE IS THE ISIS OF THE INTERNET

By Carla Reed

Just look at an outline just one example of a vast number of complaints against Google filed by hundreds of thousands of complainants:

"... Our Main Issues With Google:

- Larry Page, Jared Cohen, Sergey Brin and Eric Schmidt have systematically stolen each and every patent, trade secret and business model from us, which we launched years prior, including the architecture and business model for YouTube and Google itself. The NY Times article exposes Page's idea-theft process.

- Google staffed and controlled the Obama White House and redirected our government funds to Google's, and Google's investors, bank accounts while operating the largest political **Dark Money** conduit system in the world.

- Google exchanged compensation with Elon Musk, Dianne Feinstein and political party executives in order to produce, and mass-media-distribute, character assassination smear videos, Gawker/Gizmodo/Jalopnik tabloid hatchet job articles and fake blog posts in front of seven billion people for over a decade, locked on the top line, of the front page, of all Google product search results. At the same time, Google hid, de-listed, server code limited, down-ranked and deleted all of our advertising and positive PR. Google received and exchanged over thirty million dollars of compensation in cash, contracts, services, revolving door jobs and other remuneration, not reported to the FEC, for these attacks.

- Domestic and foreign Intelligence agency experts, law enforcement experts, forensic specialists and Congressional advisers have acquired all of Google's emails, financial reports, off-shore transaction records and employee testimony proving these assertions...."

How can Google/Alphabet get away with such misdeeds?

Because Google bought most of the politicians you have heard of. Christie Lee McNally is out to expose Google's "Mafia-like" operation through Free Our Internet!

Free Our Internet is a non-profit organization describing itself as an opponent of the "tech-left" and its political censorship of "conservative speech online."

McNally said:

"They control over 90 percent of the internet, so they don't need to capitulate to us, they don't need to capitulate to the Senate [or] the president. They don't need to capitulate 'cause they've bought them all. The amount they pay in lobbyists - if you look at FEC reports and how much they pay in lobbyists [and in] Washington, DC, they don't have to worry about legislation."

"Clearly they lied last month when they went up there," said McNally of Twitter and Facebook executives' denial of political censorship across their digital platforms during testimony before congressional committees.

Open Secrets itemized Google's lobbying spending via the technology company's FEC filings, with its most recent data coming from 2014.

The top recipient of Google's lobbying spending in 2014 was the Podesta Group...founded by Clinton loyalist and founder of the Center for American Progress and its subsidiary ThinkProgress.

Google (now part of parent company Alphabet) spent over \$18 million lobbying politicians in 2017, according to federal disclosure records. According to the Center for Responsive Politics, this is the first time a technology company has spent the most on lobbying costs in at least two decades. Google did not return TIME's request for comment about its lobbying activities.

Marlow described the threat to free speech and expression posed by large technology firms as "100 times the threat" compared with left-wing media outlets.

â Clinton Foundation Is Charity Fraud Of Epic Proportionsâ , Analyst Charges In Stunning Takedown

by [admin](#)

[Print](#)

Share:

--	--

In early May, we introduced readers to Charles Ortell, a Wall Street analyst who uncovered financial discrepancies at General Electric before its stock crashed in 2008, and whom the Sunday Times of London described as â one of the finest analysts of financial statements on the planetâ in a 2009 story detailing the troubles at AIG. Having moved on beyond simple corporate fraud, Ortell spent the past year and a half digging into something more relevant to the current US situation:â **charitiesâ , and specifically the Clinton Foundationâ s public records, federal and state-level tax filings, and donor disclosures.**

Folks who watch Ortell on Jason Goodmanâ s CrowdSource the Truth weekly know the massive amount of investigative work and analysis he has dedicated to exposing the frauds at the Clinton Foundation.

Four months ago, Ortel began releasing his preliminary findings in the first of a series of up to 40 planned reports on his website. His allegation was simple: **this is a charity fraud.**

To learn more about the Clinton Foundation, Ortel decided to take it apart and see how it worked and he has been doing that ever since February 2015.

I decided, as I did with GE, let's pick one that's complicated," said Ortel. "The Clinton Foundation is complicated, but it's really very small compared to GE."

When Ortel tried to match up the Clinton Foundation's tax filings with the disclosure reports from its major donors, he said he started to find problems. That includes records from the foundation's many offshoots including the Clinton Health Access Initiative and the Clinton Global Initiative as well as its foreign subsidiaries.

I decided it would be fun to cross-check what their donors thought they did when they donated to the Clinton Foundation, and that's when I got really irritated," he said. **There are massive discrepancies between what some of the major donors say they gave to the Clinton Foundation to do, and what the Clinton Foundation said what they got from the donors and what they did with it.**

As [previously reported](#), last year the Clinton Foundation was forced to issue corrected tax filings for several years to correct donation errors. But Ortel said many of the discrepancies remain. "I'm against charity fraud. I think people in both parties are against charity fraud, and this is a charity fraud," he said. [READ MORE](#);

Marlow described the threat to free speech and expression posed by large technology firms as "100 times the threat" compared with left-wing media outlets.

GOOGLE IS THE JONES-TOWN OF THE INTERNET

The world seems to never learn when it comes to cults. Google is a cult. It preys on its suckered-in employees and it preys on the public. Let's take a look at how it works.

Learn what a cult really is and separate the truth from the propaganda. See more [cult pictures](#).
DON HOGAN CHARLES/[GETTY IMAGES](#)

When most of us hear the word "cult," we see a bunch of brainwashed zombies feeding their children cyanide-laced fruit drink, mass murders, a burning compound in Waco, Texas -- it's not a pretty picture. But is it a true picture? What exactly is a "cult," and how is it different from a "religion"? Are all cults dangerous? Are people who join destructive cults mentally disturbed, or are all of us equally susceptible?

In this article, we'll separate fact from propaganda and learn what a cult actually is, what practices characterize a destructive cult and look at some of the more notable cult incidents in recent history.

The cults that make the news and drive fear through the hearts of parents sending their kids to college are the exception, not the rule. At its most basic, a cult is simply a small, unestablished, non-mainstream religious group that typically revolves around a single leader. The American Heritage Dictionary defines "cult" this way:

1. A religion or religious sect generally considered to be extremist or false, with its followers often living in an unconventional manner under the guidance of an authoritarian, charismatic leader.
2. A system or community of religious worship and ritual.

The first definition is closer to the common usage of the term today, but you'll notice there's no mention of brainwashing, murder or mass suicide. There is no meaningful difference between a cult and a religion in terms of faith, morality or spirituality. The primary differences are that a "cult" operates outside of mainstream society, often calls on its followers to make an absolute commitment to the group and typically has a single leader, whereas a "religion" usually operates within mainstream culture, requires varying levels of commitment from its members and typically has a leadership hierarchy that, in practice, can serve as a series

of checks and balances.

But **destructive cults** are a different story. There is a big difference between a destructive cult and a non-destructive religion (or a non-destructive cult). A destructive (or **totalist**) cult exploits its members' vulnerability in order to gain complete control over them, often using unethical psychological techniques to bring about **thought reform**. It can be said that a non-destructive religion or cult attempts to alleviate its members' vulnerability through spiritual guidance in an effort to help them exercise control over their own lives.

GOOGLE IS The JIM JONES Of The Internet

This information may serve as a resource file for any Law Enforcement department, investigating such crimes suspected of having Google's cult influence. In many instances, â strangeâ and â unusualâ symbols are left at the web scene, or transmitted through various Google results which the investigator does not know or understand, and so often these symbols are disregarded, and or discounted as non-essential and immaterial to the case at hand. These cult symbols, runes, and hieroglyphics will assist the serious investigator to gain ability and to correctly understand and recognize this new and serious crime explosion.

Types of Google's Political Digital Abuse

Confinement/isolation in small places in parents basements and dormitory rooms to watch video games, often with sensory deprivation: Blackhole/pit, cage, coffin or grave. Often the container is filled with bone or a body (animal or human), snakes, spiders, etc. Children are told that worms will eat their brains out. Often they are left for days in absolute filth. This abuse is involved in significant rituals or may be utilized as punishment. Being reborn into Satanism (hauled out of live burial) through symbolic death is a standard ritual for children.

Sexual torture: Is continuous and almost always with multiple perpetrators (both male and female); as well as trained animals. Infants and toddlers are physically prepared for later sexual abuse with objects forced into every body opening. The role of the mother figure is crucial in this early sexual abuse preparation. Sexual rituals are common and generally involve the letting of blood (girls are cut vaginally, boys cut on the penis). Sexual orgies among cult members always involve the balance of pleasure with pain to serve Satan. Girls are impregnated as early as possible, and are taught that unanesthetized abortions are an honor.

Physical deprivation: Chronic disruption of sleep, starvation, excessive exposure to heat or cold. This breaks down resistance and increases susceptibility to brainwashing.

Forced participation in abuse/murder: For children this may be real (adult hand guides child's hand to stab baby) or staged (the victim was already dead, or child's participation was suggested under hypnosis). Child is then labeled a murderer, unlovable, a criminal who will be locked up by the police, crazy and awaiting psychiatric lock up. Ultimately, many of the children will be programmed to murder for the cult on cue. They are taught by trainers how to kill, collect blood and skin victims. Even high level trainers still go through continuous torture in order to stay vicious.

Psychiatric abuse: Children are often routinely taken to an actual psychotherapist (cult member) or a person posing as one. Routine psychotherapeutic behaviors are associated with pain and fear, thus effectively sabotaging legitimate therapy for the survivor in the future. Some survivors also report being locked up and restrained in psychiatric hospitals or undergoing ECT as children.

Varied emotional abuse: Targeted at destroying child's self-esteem and self confidence. Standard caring societal messages (I love you, you're special) are linked with torture and abandonment. A child is ordered to complete a paradoxical or impossible task, then is tortured for not following orders or is blamed for the torture or murder of another child. Children are told they are worthless, dirty, stupid, ugly, evil and are lucky the cult will keep them.

Religious/spiritual abuse: Often in real or staged Christian churches, always targeted against any future acceptance of Christianity (even though many cult families masquerade as active Christians), always emphasizing control of child by Satan and his demons. Children are raped with symbolic Christian objects and are told that Jesus approved and believes they are bad. Rituals involving the insertion of eyeballs into the vagina or rectum symbolize that demons are inside the child always watching. Children are placed under numerous curses during rituals. Especially important to uncover is the curse of silence (if they tell of the cult, they and the non-cult listener will die). Although special children are taught they can develop great powers by serving satan, fear of the diety's rage seems to predominate the belief system. Most of the cult abuse is intertwined with religious dogma. Male and female children and adults are married to Satan (who is considered bisexual) at various ages.

General physical torture: Mutilation/markings the body for satan, drawing blood, banging by arms or feet, tubal insertion in body opening to allow for fluids to be introduced. Electric shock to spine/knees, dragging with rope or leash around neck, generally being treated like an animal, immersion in feces/blood

buckets/urine, pulling/drilling teeth, being burned (trial by fire), blood transfusions and skin grafts from sacrificial victims.

Drug abuse: Begins in infancy, is routinely a part of general brainwashing and rituals. Drugs are very sophisticated and often administered by medical professionals (IV, IM, gas masks, orally). Most survivors report that drugs are administered through cranial burr holes as well. The effects of drug are complex, such as resulting in paralysis from the neck down, and are very carefully induced. Some ritual torture need not be fully experienced by the child, and simply serves symbolic or spiritual purposes. The cult also uses sodium amytal to gain information.

Brainwashing: Often in conjunction with drugs, is sophisticated hypnosis which involves the associative pairing of induced pain/terror + the cult message + the trigger cue(s). Trigger cues are planted in the subconscious and are too numerous to list. They are later utilized by the cult to control the survivor without his or her conscious awareness (visual symbols on greeting cards, flower colors and arrangements, common hand gestures, verbal phrases, body postures, facial movements). Brainwashing is an integral part of ritual abuse and cult indoctrination, and also serves to create amnesia for cult information such as names, places, etc., thus protecting cult secrecy. Hypnotic introduction of visual images during abuse can hamper later therapeutic efforts to uncover accurate memories.

Near death experiences: Particularly common via suffocation torture, near drownings (head is held under water). These are utilized for punishment, to promote an out of body experiences, and are a common part of certain rituals. Victims may be resuscitated with oxygen.

Forced eating of flesh, excrement, and other fetid material: This is routine and is generally force-fed or given to child as a trick, concealed as something else after the child has been starved for days. Ritual meals of blood, flesh, semen, urine, etc., are consumed by all cult members during sacrifices to Satan. (These are commonly accompanied by nausea and vomiting). It is quite common for survivors to be very suspicious of food in general and to avoid many food types due to color or texture. Some survivors seem anorexic and others compulsively eat to combat taste memories.

Staged birthing of bad babies: Dead snakes, rats, objects are seemingly pulled from between the legs of small girls who are told they are giving birth to bad, rotten things. This serves to practice birthing and also is more evidence of how bad they are inside and need to be purified (by more abuse).

Teaching cognitive confusion: Opposites are constantly reconciled in cult behavior and training (be obedient/rebel, sex without pain is not pleasure, love and hate are the same, black is white, ugly is pretty, left is right). Children learn that none of society's concepts are stable and often represent their opposite. The child must split inside to function within this cult confusion vs. the non-cult world. cult families frequently evidence different rules at home vs. at cult gatherings.

GOOGLE KILLS ALL OF IT'S OPPOSITION PARTY VIDEOS THEN LIES AND CLAIMS IT WAS AN ACCIDENT WHEN THEY GET CAUGHT DOING IT

By

Mark Bergen

- [â](#) Video siteâ s human screening stumbles in a major early test
- [â](#) Episode shows challenge of spotting and removing content

YouTubeâ s new moderators, brought in to spot fake, misleading and extreme videos, stumbled in one of their first major tests, getting caught removing Conservative clips and channels in the midst of a nationwide debate on gun control.

The Google division said in December it would assign more than 10,000 people to moderate content after a year of scandals over fake and inappropriate content on the worldâ s largest video site.

In the wake of the Feb. 14 school shooting in Parkland, Florida, some YouTube moderators mistakenly removed several videos and some channels from right-wing, pro-gun video producers and outlets.

Some YouTube channels recently complained about their accounts being pulled entirely. On Wednesday, the Outline [highlighted](#) accounts, including Titus Frost, that were banned from the video site. Frost [tweeted](#) on Wednesday that a survivor of the shooting, David Hogg, is an actor. Jerome Corsi of right-wing conspiracy website Infowars [said](#) on Tuesday that YouTube had taken down one of his videos and disabled his live stream.

Shutting entire channels would have marked a sweeping policy change for YouTube, which typically only removes channels in extreme circumstances and focuses most disciplinary action on specific videos. But YouTube said some content was taken down by mistake. The site didnâ t address specific cases and itâ s unclear if it meant to take action on the accounts of Frost and Corsi.

"As we work to hire rapidly and ramp up our policy enforcement teams throughout 2018, newer members may misapply some of our policies resulting in mistaken removals," a YouTube spokeswoman wrote in an email. "Weâ re continuing to enforce our existing policies regarding harmful and dangerous content, they have not changed. Weâ ll reinstate any videos that were removed in error."

The misstep pulls YouTube, Google and parent [Alphabet Inc.](#) deeper into a toxic political fights over gun control, fake and extreme content, and whether internet companies should be responsible for what third parties post on their services. The episode also shows how the huge video site continues to struggle with policing the service and how difficult it is to spot troubling content and decide whether the material should be taken down.

Gun reform calls since the shooting have sparked a rash of conspiracy theories on the web about the student activists. YouTube was criticized last week after promoting a video with a title that suggested Hogg, the teen survivor of the Florida school shooting, was a paid actor. The clip contained footage from an authoritative news source, leading YouTube's software-based screening system to misclassify it. After YouTube was alerted to the video, it was pulled.

In the wake of the Florida shooting, Google and other internet companies are [facing external pressure](#) to remove the National Rifle Association's NRA TV channel from their video streaming services. To date, YouTube and other services haven't pulled the NRA's official channel.

YouTube's official policy says that "harmful or dangerous" and "hateful" content can violate its guidelines. If video creators break the rules three times within three months, YouTube terminates the account.

Alex Jones, who runs Infowars and has pushed conspiracy theories about school shootings, is the most outspoken self-proclaimed victim of YouTube. He said this week that YouTube told him his account faces two strikes. On Tuesday, an Infowars article stated that Google was "purging conservative media," claiming that "CNN and other news outlets" were lobbying Google to terminate the Infowars channel.

**GOOGLE LOVES TO USE RACISM AND SEXISM FOR
PROFIT!**

Google Allowed Advertisers To Target People Searching Racist Phrases

Google prompted BuzzFeed News to run ads targeted to keywords like "black people ruin neighborhoods," then allowed the campaign to go live.

[Alex Kantrowitz](#)

BuzzFeed News Reporter

Keyword	Clicks	Cost	CTR	Impr.	Avg. CPC	Avg. CPM
black people ruin everything	0	\$0.00	0.00%	1	\$0.00	\$0.00
jewish parasite	0	\$0.00	0.00%	2	\$0.00	\$0.00
jews control the media	0	\$0.00	0.00%	0	\$0.00	\$0.00

Google, the world's biggest advertising platform, allows advertisers to specifically target ads to people typing racist and bigoted terms into its search bar, BuzzFeed News has discovered. Not only that, Google will suggest additional racist and bigoted terms once you type some into its ad-buying tool.

Type "White people ruin," as a potential advertising keyword into Google's ad platform, and Google will suggest you run ads next to searches including "black people ruin neighborhoods." Type "Why do Jews ruin everything," and Google will suggest you run ads next to searches including "the evil jew" and "jewish control of banks."

BuzzFeed News ran an ad campaign targeted to all these keywords and others this week. The ads went live and were visible when we searched for the keywords we'd selected. Google's ad buying platform tracked the ad views. The issue is not unique to Google. On Thursday, ProPublica reported a similar issue with Facebook's ad targeting system.

Following our inquiry, Google disabled every keyword in this ad campaign save one — an exact match for "blacks destroy everything," is still eligible. Google told BuzzFeed News that just because a phrase is eligible does not guarantee an ad

campaign will run against it. A total of 17 ad impressions were served before the keywords were disabled.

"This violates our policies against derogatory speech and we have removed it," a Google spokesperson told BuzzFeed News after being sent a screenshot of live ad campaign targeted to the search terms "Zionists control the world."

Friday morning, following publication of this story, Google provided a second statement to BuzzFeed News from Senior Vice President of Advertising Sridhar Ramaswamy. "Our goal is to prevent our keyword suggestions tool from making offensive suggestions, and to stop any offensive ads appearing. We have language that informs advertisers when their ads are offensive and therefore rejected. In this instance, ads didn't run against the vast majority of these keywords, but we didn't catch all these offensive suggestions. That's not good enough and we're not making excuses. We've already turned off these suggestions, and any ads that made it through, and will work harder to stop this from happening again."

This revelation comes as Facebook is scrambling to adjust its advertising platform which allowed marketers to target "Jew haters." Facebook blamed the issue, first reported by ProPublica, on its software algorithms. The company said these targeting criteria emerged when people listed the terms under their education and employer fields of their profiles. Facebook Thursday night said it would temporarily stop offering advertisers the option to target by these self-reported targeting fields.

In our Google ad buy, BuzzFeed News used a news story as the destination URL that included relevant language that would be accepted by Google's advertising system.

There are major differences between Facebook's and Google's ad systems that make Google's system harder to police. On Facebook, you essentially pick targeting criteria from Facebook's catalogue of information about people — their gender, location, interests, and more. On Google, you target ads to terms you anticipate will be typed in the search box. So Google's universe of potential ad-targeting contains many more unknowns.

Google removed 1.7 billion ads that violated its ad policies in 2016, according to its bad ad report.

Still, BuzzFeed News' campaign was largely made up of keywords suggested by Google's ad buying platform, which seemed to go the extra mile to make sure all angles of certain racist or bigoted ad buys got covered.

Here's a quick breakdown of how the campaign was built. Typing an exact match for "why do jews ruin everything" into Google's ad-buying tool generated 77 additional keyword suggestions, from "jews ruin the world" to "jewish parasites." The keyword tool generates suggestions from the text on the destination website copy, and also pulls from search trends. Google is looking into the way the tool works, and making updates to it, the company told BuzzFeed News.

BuzzFeed News selected a few of these terms and targeted a campaign to them. Google's sole warning, at first, seemed to be that "zionist Jews run the world" wasn't searched all that often.

BuzzFeed News targeted these terms, too. Google disabled most of them after BuzzFeed News provided the company with details about the campaign, but an exact match for "black people destroy everything" is still eligible.

⚠ These entries could not be added due to the following reasons:

Punctuation and symbols [+ Detail](#)

[Pillage the women and rape the village] [Ku-Klux-Klan]
[Killing Haji]

With those keywords removed, the campaign was deemed eligible by Google's ad buying tool, though it again had concerns about low search volume.

☐	*	Keyword	Ad group	Status	Max. CPC	Clicks	Imps	CTR	Avg. CPC	Cost	Avg. Pos.	Labels
☐	+	[How kill jews?]	Ad Group #1	Eligible	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[Jew Killing Weekly Magazine]	Ad Group #1	Low search volume	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[Oil Muslim: Radicals]	Ad Group #1	Low search volume	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[Killing Bitches]	Ad Group #1	Eligible	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[Killing Hajis]	Ad Group #1	Low search volume	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[The school of Sogget murder & assassination]	Ad Group #1	Low search volume	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—
☐	+	[Threesome Race]	Ad Group #1	Eligible	\$5.00	0	0	0.00%	\$5.00	\$0.00	0.0	—

When Google disapproved some of the campaign's targeting, its system sent the following message: "We value diversity and respect for others, so we strive to avoid offending users with ads or promoted content that's inappropriate for our ad network. Please remove any content that promotes hatred, intolerance, harassment, intimidation, exploitation, violence, or self-harm."

Other perspectives on this story

- [1 One person noted the reason this problem persists is because it is structural.](#)
- [2 Another said that tech companies always seem surprised when their software is used in an unintended way.](#)
- [3 A few people hope Google is motivated by more than bad press to fix itself.](#)
- [4 The racist keywords could also allow people opposed to the groups to reach them, one person said.](#)
- [5 With no filters, the internet is entirely money-driven, another person said.](#)

GOOGLE MUST BE BANKRUPTED. IT IS AN ENEMY OF THE PUBLIC AND A VERY EVIL STAIN ON SOCIETY

This is the process for bankrupting Google and putting them out of business because they are a criminal organization.

For the purpose of this interdiction program, the trade name "Google" is comprised of a group of front companies: **Alphabet, Calico, Jigsaw, YouTube, Google, Gmail, In-Q-Tel, New America Foundation, Loon, Google Search, Google Drive, Google Chrome, Google Phones, Google Fiber, Google Android, Google Nexus, Google Pixel, Nest, Google Home, Google WiFi, DoubleClick, On2 Video, Google Energy, Google Ivanpah, WAZE, DeepMind Spy Services, Goggle DayDream VR**, etc., are all directed by the same people with the same agenda which is hostile to the public. All of these brands shall be terminated.

G

oogle's political manipulations have led to prominent media notoriety, including [criticism of the company](#) over issues such as [aggressive tax avoidance](#),^{[339][356]} [search neutrality](#), [copyright](#), [censorship](#) of search results and content, and [privacy](#).^{[357][358]} Other criticisms include alleged misuse and manipulation of search results, its use of others' [intellectual property](#), concerns that its [compilation of data](#) may violate people's [privacy](#), sexual deviancy and the [energy consumption](#) of its servers, as well as concerns over traditional business issues such as [monopoly](#), [restraint of trade](#), [anti-competitive practices](#), and [patent infringement](#).

Google dangles free candy at you and your children from the dark side alleyâs of the internet. Once it gets its victims within its grip, it bends them over the digital dumpster, in that alley, and plunders them for their privacy, votes, cash, minds and impressions.

Pass this action-item list around. Feel free to re-post it everywhere you possibly can online and in the physical world. Anytime you file a demand, carbon copy it to all press and law enforcement so that nobody can ever say *â they never knew about itâ* .

Google decided to operate election rigging and political hit-job services instead of selling a service. A company must either sell a good or a service or manipulate politics, not both. Google chose to manipulate politics and break laws and ethical standards. For these abuses of the public, it must be punished. Google is a spy tool modified to rig politics in order to put politicians in office who will give tax money to Google's crazy boss: Eric Schmidt. Google uses CIA tools and private spy operations like In-Q-Tel and New America Foundation to sabotage competitors and attack whistle-blowers. The people who run Google are racist, misogynist, arrogant oligarchs who are drunk with power and believe that the ends justifies the means no matter how horrific those means are.

WHAT ARE GOOGLE'S CRIMES AND ILLICIT ACTIVITIES?:

1. **Google is an illicit Monopoly.** Break up Google's global monopoly. Send a complaint letter about your realization that Google is an *Illicit Monopoly which controls the primary points of web access, and then censors public information in order to eliminate anything that does not comply with Eric Schmidt's ideology* to the anti-trust and regulatory commissions in each nation on Earth. Organize groups to do this in large volumes. Allowing Google to keep its monopoly and just add a bunch of new little divisions is NOT a break-up beneficial to the public!
2. **Google has manifested a system which records everything you do and keeps a lifetime file on you, attached to your social security number and name.** Write every U.S. politician and demand that laws be made to stop Google from doing that.
3. **Google, and it's underling partners, create a psychological profile of who you vote for, what your beliefs are, what can be used to trick you into doing what Eric Schmidt and his partners want.** Write letters to Congress demanding that the FBI observe the erasure of all of those illicit files Google keeps on you.
4. **Every time you touch any Google network connected device, it is recorded, analyzed, time-stamped, GPS located, and put in the master surveillance file and digitally attached to your name, social security number and global surveillance code.** Never connect to a Google product with anything that has a network modem, a plug or a battery.
5. **Anytime you check in, on any social media site, it is recorded, analyzed, time-stamped, GPS located, and put in your master surveillance file.** Never check-in or update anything about yourself on Google or other social media.
6. **Google lies to advertisers by faking user stats and impressions to make it look like user traffic on Google is bigger than it is.** A huge number of users on Google are FAKE! Contact every company that advertises on Google and encourage them to sue Google for fraud. Contact every advertising organization and encourage them to file a class-action lawsuit against Google for fraud.
7. **Every single personal fact, text, email, comment, blog response, form you fill out, or any other activity you conduct on, near, or with your computer, phone or smart device goes into your surveillance digital file to build a psychological, emotional, political, financial and manipulation study of your life.** Ask Congress, the EU and all regulators to make it illegal for Google to do this.
8. Google uses these surveillance tricks to try to make you buy certain products, to make you vote for

who Eric Schmidt wants you to vote for and to steer you, subliminally, into believing what Eric Schmidt believes. Ask Congress, the EU and all regulators to make it illegal for Google to do this.

9. Schmidt, and his minions, are able to actually rig the Google system, around the world, to eliminate certain people, views, perspectives or experiences. Ask Congress, the EU and all regulators to make it illegal for Google to do this.
10. Eric Schmidt's sexual and marital deviancies are documented in the media. Schmidt's deviancies extend well beyond the bedroom. Not quite so illuminated are his political and ideological beliefs. Schmidt believes that, because he got some huge government exclusives, which made him rich, that he is smarter than everyone else. Expose ALL sides of Eric Schmidt and his Silicon Valley Mafia, in the news.
11. Schmidt has used his billions to buy one of the largest accruals of âYes Menâ the world has ever seen. He surrounds himself, twenty deep, with whimpering hipster sycophants, who drone on, endlessly, with affirmations of his self-aggrandizing ego. Deliver messages to Schmidt, in person, at his home, office and public events telling him what is really going on.
12. Schmidt placed many of his âYes Menâ, and âYes Womenâ, in the White House. No company, in modern America, has put more of it's people inside the U.S. Government. DOX and Out every Google agent in government offices.
13. Eric Schmidt bought The White House, the privacy of the public and control of the Internet. Now it is up to the rest of the world to decide if they want to roll over and let Eric Schmidt and his Silicon Valley weasels shove it in, deep and hard, or, finally reject Google across the map. Organize neighborhood anti-Google postings on every bulletin board you can find.
14. Google receives hundreds of billions of dollars of exclusive government handouts at the expense of taxpayers and competitors. Write letters ordering your elected representatives to cut-off all government contracts to Google.
15. Google operated a monopolistic empire using state and federal funding in violation of anti-trust laws and business ethics. Demand that the FTC file monopoly charges against Google and end the cover-ups.
16. Google ordered, and operated âhit jobsâ on competitors using state and federal staff and resources. Put the same kinds of hit-jobs on every Google executive and VC.
17. Google has an executive team which strategically plans, organizes and implements the penetration of state and federal government agencies in order to illicitly steer funds and government policy to the will of Google's owners.
18. Google pays its public policy agents with cash, stock warrants, revolving door jobs, stock valuation manipulations, search engine rigging and mass-market mood manipulation data rigging worth tens of billions of dollars in unreported campaign funding and influence buying. That is a felony. It is a violation of campaign finance laws. Write to the FEC and demand that Google be prosecuted!
19. Google orders itâs staff, within government agencies, to curtail all law enforcement and regulatory control of Googleâs actions. Google programs its employees to believe that anything that Google does is for âthe greater goodâ and that âGoogle mindfulness must always prevailâ in a manner that abuses naive young employees and sets them up to not question Googleâs actions.
20. âCitizens Arrestâ Google executives and VCâs at their homes, offices, trade-shows or

restaurants and turn them in to the FBI along with a CD of all of their crimes. Follow the correct procedures for documenting and staging your Citizen's Arrest of Google VCs and executives.

21. Use databases and VOAT.CO to track and expose the tax evasion schemes, Irish false-fronts, PACS, Political stock market bribes, Stock market rigging, Google's staff and VC Hookers, voter manipulations, expenses frauds, Crony Dept. of Energy and Dept. of Transportation payola, election rigging and other forensically documented crimes.
22. Google engages in the hiding of Internet links, controlled by Google, in order to negatively affect the brand and reputation and income of competitors, across the web, globally. Report this and demand Congress stop Google.
23. Google engages in the posting of character assassination articles about competitors, the production of which were partially coordinated by Google staff and investors; , along with with it's attack contractors, on the first line of the front page of their search engine and locking those attacks there so that no outside IT or other positive global news stories could move it. Demand that Congress fund private funds to pay for lawsuits by the public against Google to stop these attacks.
24. Google executives and venture capitalists have the highest sexual abuse, sex trafficking and sexual deviancy record of any corporation in the USA. Over 800 Google-related twisted sex incidents have been recorded including: The Doy Katz underage sex arrest; The Mike Goguen Anal Sex Slave Sex trafficking case; The Eric Schmidt Sex Penthouse case; The Joe Lonsdale rape case; The Ellen Pao Sex abuse case; The Ravi Kumar hooker death case; The Forrest Hayes Sex murder case; The Stanford Frat house rape cover-ups; The Intern sex abuse scandals; The Stanford Graduate School of Google Teacher: The Brock Allen Turner Rapes; Dean Garth Saloner Sex scandals; The Silicon Valley Hooker parties; The Rosewood Hotel Thursday Night Sex Pick-up scene for Google VCs, The Larry Page/Elon Musk gay romp rumors; The Eric Schmidt Marriage Cheating Scandal; The Elon Musk Divorces; The Plane-loads of Ukrainian prostitutes being flown into SFO for Google Executives and VCs; The brutal assaults of women by Gurbaksh Chahal; The #PizzaGate Connections to vast numbers of Google people; The Draper Fisher Intern Rape Investigation; The Famous Gay Tech CEO's Who Have a Cover Wives Revelations; The Sergey Brin 3 Way Sex Romp With His Google Glasses Staff; and hundreds more need to be publicly discussed and analyzed.
25. Upon legal receipt of removal demands from competitors and their lawyers, Google refused, in writing, to remove the attacks in order to damage competitors maximally. Public support needs to be expanded to sue Google for refusing to cease attacks upon demand.
26. Google engages in DNS, web pointing, down-ranking and search results targeting in order to damage the Internet operation of competitors web-sites and press releases. This must be reported to FTC and SEC as felony abuse of public rights.
27. Google's competitors hired IT experts to do a multi-year sting and IT analysis investigation, involving the setting of hundreds of a trap servers around the world, to prove, over a five+ year period, that Google was manipulating search results in order to damage some parties and falsely enhance others, who were Google's covert partners. Other parties, including universities, research groups, the European Union, The Government of China, The Government of Russia and other parties, have now emulated and proven these results showing definitive proof of Google's malicious manipulation of the Internet in order to damage it's competitors and promote it's friends while also damaging it's friend's competitors. Google must be sued for these crimes. Sue each Google Executive

and VC, individually, one at a time, in Small Claims Court!

28. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Gawker Media.
29. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Steve Spinner.
30. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Wilson Sonsini.
31. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Steven Chu.
32. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider In-Q-Tel.
33. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider John Doerr.
34. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider Vinod Khosla.
35. Track and publicly expose Google's financial, stock market, management, marketing, and personal relationship with attack services provider New America Foundation.
36. Google sought to *Cheat Rather Than Compete* against competitor's products, which have now been proven, by industry documentation, to have been superior to Google's. Expose Google as a cheater.
37. In light of the accruing charges and evidence, Google was forced to break-up it's main operation, changing it's name from: Google to Alphabet, in order to attempt to mitigate it's damages in this, and other pending cases, by creating a false-front structure whereby Google attempt to hide their tax and legal liability obligations by, on paper, reducing the operation into smaller parts. Expose Google's sham corporate structure and shell companies and recognize the entire operation, and each and every part, and owner, as being liable for competitors damages.
38. Google copied dozens of competitors products, which the federal patent office had issued patents and secured files on as being first developed by others, years before any interest in, or development by competitors. Google either gave away the copied products, in order to terminate competitor's revenue opportunities, or used billions of dollars of unjust rewards secured, according to the U.S. Treasury, from ill-gotten gains via contract manipulations and illegitimate tax loss write-offs and payola tax waivers, to flood competitor's out of the market and order financing blacklists to be created by their investors. The New York Times article on Larry Page proves him to be a patent thief. Google's patent attorney runs the U.S. Patent Office. Demand that Michelle Lee be fired from the U.S. Patent Office and that a public fund be established by Congress to help small inventors who are attacked and blockaded by Google.

39. Google engaged in additional malicious harassment using retained writers who did not disclose their
â shillâ , â meat puppetâ , â Trollâ and â Click-Farmâ media attack services
function for Google. Dox and Expose the media shills that Google hires.
40. Google engaged in other malicious activities, against competitors, disclosed to competitors by
whistle-blowers and ex-employees of Google which are documented in Google electronic
communications. The NSA, CIA, DIA, FBI and Congress have all of Googles emails since 2006.
Demand public revelation of those emails.
41. Larry Page, Eric Schmidt, Ann Wojcicki and Sergey Brin did not build the first Google, they stole the
technology from others. Competitors can prove it in court! News reports, Congressional and law
enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal
Prosecutor to investigate these charges.
42. Google, YouTube, Alphabet, Jigsaw, In-Q-Tel, and all of their various front organizations, are
controlled by the same people with the same bizarre agenda. Competitors can prove it in court! News
reports, Congressional and law enforcement reports already prove it. Demand an end to the cover-ups
with letters to Congress. Demand a public inquiry into these charges. Demand a Federal Prosecutor to
investigate these charges.
43. Google, and a company called Kleiner Perkins, have a campaign payola deal with White House
executives. This deal trades search engine rigging for Cleantech â green moneyâ handouts
ordered up by White House staff from various state and federal agencies. Competitors can prove it in
court! News reports, Congressional and law enforcement reports already prove it. Demand a public
inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
44. Google has a contracted relationship with non-Congressionally approved rogue groups, like In-Q-Tel,
Media Matters and New America Foundation; who use U.S. treasury funds to attack competitors.
competitors can prove it in court! News reports, Congressional and law enforcement reports already
prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate
these charges.
45. While it is well known that the CIA finances Google it is unclear if Google works for the CIA or the
CIA works for Google. Demand a public inquiry into these charges. Demand a Federal Prosecutor to
investigate these charges.
46. Google staged a program to give â freeâ Google computers and software to children in order to
indoctrinate them when they are young like McDonalds does by putting playgrounds at all of the
McDonalds. Googleâ s child propaganda effort copied the CIAâ s South American indoctrination
program to a T. Demand a public inquiry into these charges. Demand a Federal Prosecutor to
investigate these charges.
47. Google has paid money to Gawker Media and Gawker Media has paid money to Google. competitors
can prove it in court! News reports, Congressional and law enforcement reports already prove it.
Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these
charges.

48. Google and Gawker Media have a series of quid-pro-quo relationships which provide for the mutual deployment of character assassinations of their business and political enemies. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
49. Google has placed over 400 of Google's staff inside of the U.S. Government and the California State Government. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
50. Google's lawyer, and other Google associates, work in and control the U.S. Patent Office for the protection of Google patent territory. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
51. Google has always had, and today fully has, total control over the text, links, results, adjacent results and all positioning of each and every Google search result and Mnemonic impression and Google selectively adjusts those results in order to harm competitors and political adversaries and hype investor friends and partners like Elon Musk. Google lied to government regulators, in multiple nations, when Google stated that executives had no control over Google results. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
52. Competitors, competitors lawyers and others sent hundreds of communications to Google asking Google to stop harassing, cyber-stalking and search engine locking attacks against competitor's which Google refused to comply with and in fact, increased the attacks mentioned herein. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
53. Google receives operational orders from White House campaign financiers. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
54. Google stated on the record that it's search results change every few hours yet Google locked each attack on competitors on the same top lines of the front page of Google, around the globe, for over five years without any shift in placement. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
55. Google meets the legal definition as an organized crime RICO-violation illicit Cartel. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
56. Google lies about how many women and blacks it hires. Expose this fact.
57. Google bribes politicians to get Google's owned politicians to harm Google's competitors. competitors can prove it in court! News reports, Congressional and law enforcement reports already

prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.

58. Competitors placed thousands of server sensors in different ISPs in different locations around the entire internet for extended periods of time in order to catch Google rigging the internet and did, in fact, catch Google rigging the internet. Others have emulated these tests and also caught Google rigging internet results. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
59. Google rigs the internet to hide misdeeds and company failures by Elon Musk while, concurrently, pumping up and hyping cover stories to hide those misdeeds because Larry Page and Elon Musk are best boyfriends and Google owns parts of Tesla and Tesla battery suppliers. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
60. Email this document to anybody in your contact manager that has a @Gmail address. Send this to everyone you discover with a @Gmail address so you can save them from getting â data-raped and privacy abusedâ by Google.
61. Google has received billions and billions of U.S. Treasury money that were exclusively provided to Google. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
62. Google pumps marketing hype for stock market pump-and-dumps which inure exclusively to Google investors and against Google enemies. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
63. Google sabotaged and circumvented competitor's government funding and rerouted it to Google. competitors can prove it in court! News reports, Congressional and law enforcement reports already prove it. Demand a public inquiry into these charges. Demand a Federal Prosecutor to investigate these charges.
64. Post this phrase everywhere you can: **â FRIENDS DONâ T LET FRIENDS USE GOOGLEâ**
65. Write every trade office of every nation on Earth and show them this document and tell them that **â ...most people hate Googleâ and to â ...not do business with Google or their citizens will look upon them unkindly.â**
66. **Make certain that everyone in the world knows that:** [Hidden Voice Commands Could Hijack Your Phone from up to 10 feet away, or via embedded Youtube audio. \(vocativ.com\)](#) and that nobody should use Googleâ s YouTube.
67. Google uses cheap overseas labor to keep Americans out of work. Sue Google and file charges with equal opportunity and job rights organizations if Google discriminates against you because you are a U.S. Citizen. Post notices on all Asian blogs about what a lying, abusive, crappy employer Google is.
68. Put a President like Donald Trump in the White House.

69. Have Donald Trump and Congress make laws that stop Google from doing Google's crimes and domestic business abuses.
70. Expose Google's entire DNS ring to every global interdiction team that can provide counter-measures to Google's illegal control of information.
71. Find everyone that Google has abused and provide them with a free, pre-written, in-pro-per lawsuit against Google.
72. Hire private a public investigators to hunt down all of Google's staff and VC's illegal sex trafficking operations: ie: Michael Goguen, Forrest Hayes, John Doerr, Sergy Brin, etc. (There are hundreds) and help the victims sue those abusers.
73. Shut down every abuse of domestic workers by filing lawsuits against Google's abuse of Women, Blacks, Young Asian boys, interns and other groups.
74. Lobby The White House for Executive Orders that make Google stop running an illicit Cartel.
- 75) Sue each Google manager, director, owner and VC in small claims court individually for the maximum amount that the small claims court allows. Each voter should sue each executive of Google and get their \$5000.00, \$10,000.00, etc. payments from Google for Google's damages to them on a personal basis.
- 76) Do not FOR EVEN ONE SECOND let Google PR shills spin the hype that *â Those were the previous people at Google that did all of those bad things, we are all new and shiny and non-Evilâ* That is their lie! The people at Google have gotten MORE evil!
- 77) Post, point to, link to and publicize the Corbett Report videos about Google at:

Polls Proves That Nobody Will Trust Apps, Phones or Googleâ s Social Media Ever Again!

A survey found 64 percent of Americans said they had some form of personal data stolen or compromised making them especially wary of the government and social media companies and those numbers are rapidly accelerating.

Nearly two-thirds of Americans have experienced some kind of data theft or fraud, leaving many mistrustful of institutions charged with safeguarding their information, a huge credible poll showed.

The Pew Research Center survey found 41 percent of Americans have encountered fraudulent charges on their credit cards, and 35 percent had sensitive information like an account number compromised.

Many said their email or social media accounts had been compromised or that someone had impersonated them in order to file fraudulent tax returns.

Taken together, the survey found 64 percent said they had some form of personal data stolen or compromised.

Following the epidemic of data breaches and hacks, "many Americans lack faith in specific public and private institutions to protect their personal information from bad actors," the study authors wrote.

Those surveyed were concerned about Google, telecom firms, credit card companies and others, but especially wary of the government and social media companies that report to the CIA, The Clinton Foundation and the NSA.

Only 12 percent said they had a high level of confidence in the governmentâ s ability to protect their data and nine percent said the same of social media sites. The trend is moving towards a total avoidance of Google and Facebook.

Former Facebook executive speaks the truth about social networks

Chamath Palihapitiya claims Facebook and Google are effectively surveillance states.

Expert in Opinion

Curated by [Philip Hughes](#)

Published on:

We have been conditioned into thinking there is nothing wrong with giving up our privacy. Governments and corporations all over the world are using personal information to spread propaganda and feed us advertisements, while at the same time effortlessly installing **#Mass Surveillance**. This is why someone claiming [#Facebook](#) and [Google](#) are effectively surveillance states isn't anything new.

Effortless mass surveillance

However, those claims, without a doubt, carry considerably more weight when they come straight from the horse's mouth. Former **Facebook** executive, **Chamath Palihapitiya**, recently talked to CNBC and confirmed what many of us know.

Interestingly, the vast majority of the corporate-controlled mainstream media ignored the interview.

Chamath Palihapitiya said to the CNBC: "Facebook and Google effectively are surveillance states...they have so much personal, private information about so many citizens of so many countries." Furthermore, Palihapitiya argues that both companies are practically "inviting a government crackdown."

While mister Palihapitiya's heart might be in the right place, it's difficult to expect governments to intervene and introduce regulatory measures, when governments and corporations are those benefiting the most from this. [Big Brother](#) is alive and well, watching every move you make. While Palihapitiya claims that **Google** and **Facebook** are "effectively surveillance states," one can't help but conclude that both companies are indeed tools of the surveillance state, just another weapon in the state's arsenal, so to speak.

The implications

Chamath Palihapitiya is not the first and probably not the last ex-insider to speak about this publicly. The question is: what can we do about it? A right not exercised is a right lost -- claiming you have "nothing to hide" is like claiming you have "nothing to say" and letting the state take away your freedom of speech. Realizing that this is wrong and a massive **privacy invasion** is a great step in the right direction.

Apart from that, it's safe to assume that the tighter the rope the state ties around the peoples' necks, the greater the chances of us completely rejecting everything to do with the so-called surface web and emigrating to places like [the dark web](#). Anonymity is a right. And if things keep moving in this direction, more and more of us will have to learn how to exercise it. #social networks

GOOGLE NOW BRIBING POLITICIANS TO TRY TO GET ALL REGULATIONS ON GOOGLE REMOVED!

After Facebook lobbying failed, Google takes aim at U.S. law banning use of biometric data without consent

BY [KARTIKAY MEHROTRA](#)

BLOOMBERG

- [ARTICLE HISTORY](#)
- [PRINT](#)

SAN FRANCISCO — Alphabet Inc. is pushing efforts to roll back the most comprehensive biometric privacy law in the U.S., even as the company and its peers face heightened scrutiny after the unauthorized sharing of data at Facebook Inc.

While Mark Zuckerberg and Sheryl Sandberg were publicly apologizing this month for failing to protect users' information, Google's lobbyists were drafting measures to de-fang an Illinois law recognized as the most rigorous consumer privacy statute in the country. Their ambition: to strip language from a decade-old policy that regulates the use of fingerprints, iris scans and facial recognition technology, and insert a loophole for companies embracing the use of biometrics.

Google is trying to exempt photos from the Illinois law at a time when it's fighting a lawsuit in the state that threatens billions of dollars in potential damages. The world's largest search engine is facing claims that it violated the privacy of millions of users by gathering and storing biometric data without their consent.

Facebook has faced a global backlash for failing to secure users' information, triggered by revelations that a British firm with ties to President Donald Trump's 2016 campaign harvested information from as many as 87 million Facebook users without their knowledge. That breach has put the tech behemoth and its Silicon Valley cohort at the center of a fierce data privacy debate.

Facebook is trying to show it's taking consumer privacy more seriously, but there's an inexorable dilemma: The business models and future growth of both Google and the world's largest social network are tied up with the very data they're now being asked to lock up — information most users have volunteered in exchange for these companies' free products and services.

Illinois state senator Bill Cunningham proposed an amendment to the Biometric Information Privacy Act in February then aimed at saving a local nursing home from overly burdensome litigation. Google and lobbyists from the Illinois Chamber of Commerce — of which Facebook is a member — intervened, and on April 4 they offered a new version with Cunningham to embed further caveats in the legislation, including language to exclude photos from regulatory scrutiny.

Facebook — which attempted to scale back the law in 2016 — said it didn't play a role in the drafting or lobbying of the recent proposal. Still, critics contend the company would be an obvious beneficiary of a watered-down BIPA, along with Google, which declined to comment on its role in revising the bill.

“The ball is in tech companies’ court now,” said Pam Dixon, executive director of the World Privacy Forum. “Working to overturn a privacy law is certainly not the best approach.”

The amended bill in Illinois has twice been called to committee in the state senate, and twice pulled from the agenda over “misconceptions with what the bill aims to achieve,” said Cunningham. He confirmed he “ll continue to meet with Google’s lobbyist, the Illinois Chamber and privacy advocates in search of a compromise. Central to his effort and Google’s is ending the mountain of litigation triggered by BIPA that’s spawned more than 140 lawsuits since 2014.

“We’d like to see a fix to the law, which is as old as the iPhone 3G,” said Tyler Diers, director of legislative relations at the Illinois Chamber of Commerce. “The technology this law was regulating has evolved.”

Most of the claims have been filed on behalf of employees in Illinois whose employers have incorporated biometric technology without written consent. The lawsuits threaten the viability of those local businesses, Cunningham said.

“It’s my goal to find a middle ground where we protect the privacy of citizens and their biometric material, but do it in a way that allows people in Illinois to access technologies and applications that everyone else in the country is accessing,” he said. Services such as Google’s Arts & Culture app “which will locate museum portraits that resemble you based on a selfie, among other things” weren’t released in Illinois because of BIPA.

“You can allow for certain technological advances without relieving the burden on businesses to protect that data,” Cunningham said. “If a business is negligent in protecting biometric material, they should be held accountable.”

If the bill passes, Cunningham, a Democrat, is confident both houses of the state assembly will push the law to the governor’s desk.

BIPA is the only U.S. state or federal law that affords people the right to sue companies for using their biometric data without consent. The proposed amendment would undoubtedly trim the number of lawsuits that employers face in state courts, such as the nursing home in Cunningham’s district sued for replacing punch-out cards with fingerprint scanners for its hourly employees without their written agreement.

Changing the law could also affect a pair of federal lawsuits against Google and Facebook, which are two of the world’s largest users of biometrics. Facebook is headed toward trial in July in a case brought on behalf of more than 6 million users in Illinois that seeks as much as \$5,000 per BIPA violation.

For years Facebook has encouraged users to tag people in photographs they upload in their personal posts, and the company stores the information. Alphabet’s cloud-based Google Photos service uses similar technology, prompting a separate lawsuit with a comparable class. Facebook lobbied for a similar legislative amendment in 2016 after failing to persuade a federal judge to dismiss the lawsuit over its face-tagging feature.

Until about two years ago, Google had maintained a reputation as a tech giant even some privacy advocates could support. When Google altered its offerings so advertisers could mix users’ browsing behavior with their search history in ad targeting, the company insisted on providing an opt-out option. Those privacy advocates are worried the BIPA proposal may signal a shift in ideology over user consent.

With regard to the privacy suit it faces in Illinois, filed in 2016, Google has said photos don’t belong under BIPA and that including them would render the law unconstitutional. By pushing to strip photos from the

Illinois statute, Google is distancing itself from being known as an organization that prioritizes user consent in order to avoid further litigation, said Alvaro Bedoya, Executive Director for the Center on Privacy & Technology at the Georgetown University Law Center.

Historically, Google has gone out of its way to give people a choice about whether they want to be in a face recognition system, Bedoya said. Their support for this amendment would mark a complete reversal in the company's approach to this powerful and invasive technology. It would be deeply disappointing.

How the mighty have fallen: Anglian Water knocks Google off perch as UK's best workplace

Facebook not even in survey's top 50, while Goldman Sachs lords it over tech's big-hitters

By [Rebecca Hill](#)

10  [SHARE](#) $\hat{=}$ $\frac{1}{4}$

It would appear that the kickback against big tech continues apace as Facebook has dropped out of a list of the top 50 best places to work in the UK and Google has been knocked off its top spot... by a water company.

That's according to the [results](#) from the 2019 Employee's Choice Best Places To Work list, which is compiled each year by Glassdoor based on staffer feedback between October 2017 and October 2018.

The Chocolate Factory has, in fact, crashed out of the top 10 altogether into 13th position $\hat{=}$ just behind everyone's favourite crystal ball-gazer Gartner.

But it's not as bad as Facebook, which was ranked fourth last year and has disappeared from the top 50 entirely.

The highest-scoring tech vendor is Salesforce, which stayed in fifth. The company often [boasts about its ethical credentials](#) and calls its staff "Ohana" after the Hawaiian term for family bonds. Aw.

Lower down the list are Cisco (37), Apple (43), Siemens (46) and Accenture (48) $\hat{=}$ all of which were beaten by the "[great vampire squid](#)" Goldman Sachs (36).

The fortunes of Microsoft, however, went the other way, rising from 24th to 11th. But perhaps the most improved firm was SAP, which shot up from 47th to eighth.

This year the German ERP giant has overhauled its image, forking out for star-studded [commercials](#) to sell the idea that it will make the world a better place, and pushing a message of trust in the aftermath of the indirect licensing saga. Whether [customers](#) would rate it so highly is another question.

In the US, the tech giants at the centre of data harvesting and tracking scandals also saw a slight decline $\hat{=}$ Facebook lost its top spot, falling to seventh and Google fell from fifth to eighth.

LinkedIn, meanwhile, climbed the ranks from 21st to sixth as Salesforce tiptoed closer to the top 10, stopping at 11th up from 15th this year. $\hat{=}$ ®

That's according to the [results](#) from the 2019 Employee's Choice Best Places To Work list, which is compiled each year by Glassdoor based on staffer feedback between October 2017 and October 2018.

The Chocolate Factory has, in fact, crashed out of the top 10 altogether into 13th position $\hat{=}$ just behind everyone's favourite crystal ball-gazer Gartner.

But it's not as bad as Facebook, which was ranked fourth last year and has disappeared from the top 50 entirely.

The highest-scoring tech vendor is Salesforce, which stayed in fifth. The company often [boasts about its ethical credentials](#) and calls its staff "Ohana" after the Hawaiian term for family bonds. Aw.

Lower down the list are Cisco (37), Apple (43), Siemens (46) and Accenture (48) $\hat{=}$ all of which were beaten by the "[great vampire squid](#)" Goldman Sachs (36).

The fortunes of Microsoft, however, went the other way, rising from 24th to 11th. But perhaps the most improved firm was SAP, which shot up from 47th to eighth.

This year the German ERP giant has overhauled its image, forking out for star-studded [commercials](#) to sell the idea that it will make the world a better place, and pushing a message of trust in the aftermath of the indirect licensing saga. Whether [customers](#) would rate it so highly is another question.

In the US, the tech giants at the centre of data harvesting and tracking scandals also saw a slight decline $\hat{=}$ Facebook lost its top spot, falling to seventh and Google fell from fifth to eighth.

LinkedIn, meanwhile, climbed the ranks from 21st to sixth as Salesforce tiptoed closer to the top 10, stopping at 11th up from 15th this year. $\hat{=}$ ®

THE INDEPENDENT TECH

The most famous phrase in Googleâs corporate philosophy, â Donât be evil,â has been almost entirely removed from the technology giantâs code of conduct.

Google, which is now [a subsidiary of Alphabet](#) after a corporate restructuring in 2015, previously included the phrase â Donât be evilâ at the very start of its code, and another two times within the first two paragraphs.

The simple language was replaced by vague and less specific wording such as â ethical business conductâ .

â The Google Code of Conduct is one of the ways we put Googleâs values into practice,â the updated guidelines begins.

â Itâs built around the recognition that everything we do in connection with our work at Google will be, and should be, measured against the highest possible standards of ethical business conduct.â

The famous motto is now included only once in the 6,313-word document, right at the very end as a final aside: "And remember! don't be evil, and if you see something that you think isn't right â speak up!"

The updated code of conduct comes as artificial intelligence researchers call for Google to abandon a [project developing AI technology](#) for the military.

Google's refusal to cut ties with the US military led to the resignation of around a dozen employees from the company, who cited ethical concerns and warned that autonomous weapons directly contradicted the firm's famous 'Don't be evil' motto.

In a letter signed by more than 3,100 Google employees last month, the workers stated: "We believe that Google should not be in the business of war... We cannot outsource the moral responsibility of our technologies to third parties," referring to the company's involvement in a controversial Pentagon program called Project Maven.

READ MORE

- [Hundreds of AI experts call on Google to stop weaponizing technology](#)

"Therefore we ask that Project Maven be cancelled, and that Google draft, publicise and enforce a clear policy stating that neither Google nor its contractors will ever build warfare technology."

[Google](#) had not responded to a request for comment on the demotion of the phrase at the time of publication. This article will be updated if a response is received.

GOOGLE PAYS THE SPLC TO DO PART OF ITS DIRTY WORK

Southern Poverty Law Center Transfers Millions in Cash to Offshore Entities

Left-wing nonprofit pays lucrative six-figure salaries to top management

The Southern Poverty Law Center (SPLC), a liberal, Alabama-based 501(c)(3) tax-exempt charitable organization that has gained prominence on the left for its "hate group" designations, pushes millions of dollars to offshore entities as part of its business dealings, records show.

Additionally, the nonprofit pays lucrative six-figure salaries to its top directors and key employees while spending little on legal services despite its stated intent of "fighting hate and bigotry" using litigation, education, and other forms of advocacy.

The Southern Poverty Law Center is perhaps best known for its ["hate map."](#) a collection of organizations the nonprofit deems "domestic hate groups" that lists mainstream conservative organizations alongside racist groups such as the Ku Klux

Klan and is often referenced in the media. A gunman opened fire at the Washington, D.C., offices of the conservative Family Research Council in 2012 after [seeing it listed](#) as an "anti-gay" group on SPLC's website.

The SPLC has turned into a fundraising powerhouse, recording more than \$50 million in contributions and \$328 million in net assets on its [2015 Form 990](#), the most recently available tax form from the nonprofit. SPLC's Form [990-T](#), its business income tax return, from the same year shows that they have "financial interests" in the Cayman Islands, British Virgin Islands, and Bermuda. No information is available beyond the acknowledgment of the interests at the bottom of the form.

However, the *Washington Free Beacon* discovered [forms](#) from 2014 that shed light on some of the Southern Poverty Law Center's transfers to foreign entities.

The SPLC's Form [8865](#), a Return of U.S. Persons With Respect to Certain Foreign Partnerships, from 2014 shows that the nonprofit transferred hundreds of thousands to an account located in the Cayman Islands.

SPLC lists Tiger Global Management LLC, a New York-based private equity financial firm, as an agent on its form. The form [shows](#) a foreign partnership between the SPLC and Tiger Global Private Investment Partners IX, L.P., a [pooled investment](#) fund in the Cayman Islands. SPLC transferred \$960,000 in cash on Nov. 24, 2014 to Tiger Global Private Investment Partners IX, L.P, its records show.

The SPLC's Form [926](#), a Return by a U.S. Transferor of Property to a Foreign Corporation, from 2014 shows additional cash transactions that the nonprofit had sent to offshore funds.

The SPLC [reported](#) a \$102,007 cash transfer on Dec. 24, 2014 to BPV-III Cayman X Limited, a foreign entity located in the Cayman Islands. The group then sent \$157,574 in cash to BPV-III Cayman XI Limited on Dec. 31, 2014, an entity that lists the same PO Box address in Grand Cayman as the previous transfer.

The nonprofit pushed millions more into offshore funds at the beginning of 2015.

On March 1, 2015, SPLC [sent](#) \$2,200,000 to an entity incorporated in Canana Bay, Cayman Islands, according to Securities and Exchange Commission (SEC) [records](#) and run by a firm based in Greenwich, Ct. Another \$2,200,000 cash transfer was [made](#) on the same day to another fund whose business is located at the same address as the previous fund in the Cayman Islands, according to SEC [records](#).

No information is contained on its interests in Bermuda on the 2014 forms. SPLC's financial stakes in the British Virgin Islands were not acknowledged until its 2015 tax form.

Lucinda Chappelle, a principal at Jackson Thornton, the public accounting firm in Montgomery, Ala., that prepared the SPLC's tax forms, said she does not discuss client matters and hung up the phone when the *Free Beacon* contacted her in an attempt to get the most updated forms from the group in relation to its foreign business dealings.

Tax experts expressed confusion when being told of the transfer.

"I've never known a US-based nonprofit dealing in human rights or social services to have any foreign bank accounts," said Amy Sterling Casil, CEO of Pacific Human Capital, a California-based nonprofit consulting firm. "My impression based on prior interactions is that they have a small, modestly paid staff, and were regarded by most in the industry as frugal and reliable. I am stunned to learn of transfers of millions to offshore bank accounts. It is a huge red flag and would have been completely unacceptable to any wealthy, responsible, experienced board member who was committed to a charitable mission who I ever worked with."

"It is unethical for any US-based charity to invest large sums of money overseas," said Casil. "I know of no legitimate reason for any US-based nonprofit to put money in overseas, unregulated bank accounts."

"It seems extremely unusual for a 501(c)(3)' concentrating upon reducing poverty in the American South to have multiple bank accounts in tax haven nations," Charles Ortel, a former Wall Street analyst and financial advisor who [helped](#) uncover a 2009 financial scandal at General Electric, told the *Free Beacon*.

The nonprofit also pays lucrative salaries to its top leadership.

Richard Cohen, president and chief executive officer of the SPLC, was given \$346,218 in base compensation in 2015, its [tax forms](#) show. Cohen received \$20,000 more in other reportable compensation and non-taxable benefits. Morris Dees, SPLC's chief trial counsel, received a salary of \$329,560 with \$42,000 in additional reportable compensation and non-taxable benefits.

The minimum amount paid to an officer, director, trustee, or key employee in 2015 was \$140,000 in base salary, not including other compensation. The group spent \$20 million on salaries throughout the year.

The SPLC, which [claims](#) to boast a staff of 75 lawyers who practice in the area of children's rights, economic justice, immigrant justice, LGBT rights, and criminal justice reform, [reported](#) spending only \$61,000 on legal services in 2015.

Following recent violence in Charlottesville, Va., the group raised a great deal of money.

Apple CEO Tim Cook [told](#) his employees that the company is donating \$1 million to the SPLC and would match employee contributions two to one. Cook also [placed](#) an SPLC donation button in its iTunes store. The company is additionally providing a \$1 million donation to the Anti-Defamation League.

J.P Morgan Chase [vowed](#) to add a \$500,000 donation for the group's "work in tracking, exposing, and fighting hate groups and other extremist organizations."

The Washington Times [reported](#) that CNN ran a wire story following the Charlottesville events originally titled, "Here are all the active hate groups where you live" using SPLC's list of 917 groups.

Brad Dacus, the president of the Pacific Justice Institute, a Sacramento-based group that defends "religious freedom, parental rights, and other civil liberties without charge," was listed on the "hate groups" list.

"Why is the Southern Poverty Law Center doing this? It's simple. They want to vilify and isolate anyone that doesn't agree with their very extremist leftist policy and ideology," Dacus [told](#) the *Times*. "This isn't about defending civil rights; this is about attacking civil rights."

"I am shocked that CNN would publish such a false report on the heels of the Charlottesville tragedy," [added](#) Mat Staver, the founder of Liberty Counsel, a Christian nonprofit that provides pro bono assistance and representation, which is also featured on SPLC's list. "To lump peaceful Christian organizations, which condemn violence and racism, in with the KKK, neo-Nazis, and white supremacists is offensive. This is the epitome of fake news and is why people no longer trust the media."

CNN later changed its headline to, "The Southern Poverty Law Center's list of hate groups."

"The SPLC is an anti-conservative, anti-Christian hate group that the media have given pretend legitimacy to. One glance at their 990 tax forms is a reminder just what a fund-raising super-power it is," Dan Gainor, vice president of Business and Culture at the Media Research Center, told the *Free Beacon*. "Its assets are over \$328 million in 2015 and went up \$13 million in just one year. It doesn't need new liberal money. It could operate for at least six years and never raise a penny. It's like a perpetual motion machine for fundraisers."

The SPLC [has also been hit](#) with a number of lawsuits over "hate" defamation claims in recent days.

The Southern Poverty Law Center did not return a request for comment on its foreign financial dealings by press time.

GOOGLE PITCHED CHINESE BOSSES AS "BEST COVERT INFO MANIPULATOR ON EARTH"

[Ryan Gallagher](#)

Illustration: Other Means for The Intercept

[LEIA EM PORTUGUÊS](#)

GOOGLE IS PLANNING to launch a censored version of its search engine in China that will blacklist websites and search terms about human rights, democracy, religion, and peaceful protest, The Intercept can reveal.

The project — code-named Dragonfly — has been underway since spring of last year, and accelerated following a December 2017 meeting between Google's CEO Sundar Pichai and a top Chinese government official, according to internal Google documents and people familiar with the plans.

Teams of programmers and engineers at Google have created a custom Android app, different versions of which have been named — Maotai — and — Longfei. — The app has already been demonstrated to the Chinese government; the finalized version could be launched in the next six to nine months, pending approval from Chinese officials.

The planned move represents a dramatic shift in Google's policy on China and will mark the first time in almost a decade that the internet giant has operated its search engine in the country.

Google's search service cannot currently be accessed by most internet users in China because it is blocked by the country's so-called Great Firewall. The app Google is building for China will comply with the country's strict censorship laws, restricting access to content that Xi Jinping's Communist Party regime deems unfavorable.

The search app will — blacklist sensitive queries.

The Chinese government blocks information on the internet about political opponents, free speech, sex, news, and academic studies. It bans websites about the 1989 Tiananmen Square massacre, for instance, and references to — anticommism — and — dissidents. — Mentions of books that negatively portray authoritarian governments, like George Orwell's 1984 and Animal Farm, have been [prohibited](#) on Weibo, a Chinese social media website. The country also censors popular Western social media sites like Instagram, Facebook, and Twitter, as well as American news organizations such as the New York Times and the Wall Street Journal.

Documents seen by The Intercept, marked — Google confidential, — say that Google's Chinese search app will automatically identify and filter websites blocked by the Great Firewall. When a person carries out a search, banned websites will be removed from the first page of results, and a disclaimer will be displayed stating that — some results may have been removed due to statutory requirements. — Examples cited in the documents of websites that will be subject to the censorship include those of British news broadcaster BBC and the online encyclopedia Wikipedia.

The search app will also — blacklist sensitive queries — so that — no results will be shown — at all when people enter certain words or phrases, the documents state. The censorship will apply across the platform: Google's image search, automatic spell check and suggested search features will incorporate the blacklists, meaning that they will not recommend people information or photographs the government has

banned.

Within Google, knowledge about Dragonfly has been restricted to just a few hundred members of the internet giant's 88,000-strong workforce, said a source with knowledge of the project. The source spoke to The Intercept on condition of anonymity, as they were not authorized to contact the media. The source said that they had moral and ethical concerns about Google's role in the censorship, which is being planned by a handful of top executives and managers at the company with no public scrutiny.

It is a problem against large companies and governments collaborating in the oppression of their people.

It is a problem against large companies and governments collaborating in the oppression of their people, and feel like transparency around what is being done is in the public interest, the source said, adding that they feared what is done in China will become a template for many other nations.

Patrick Poon, a Hong Kong-based researcher with human rights group Amnesty International, told The Intercept that Google's decision to comply with the censorship would be a big disaster for the information age.

This has very serious implications not just for China, but for all of us, for freedom of information and internet freedom, said Poon. It will set a terrible precedent for many other companies who are still trying to do business in China while maintaining the principles of not succumbing to China's censorship. The biggest search engine in the world obeying the censorship in China is a victory for the Chinese government it sends a signal that nobody will bother to challenge the censorship any more.

It is unclear whether Google will eventually launch a desktop version of its censored China search platform. For now, the company is focused on initially rolling out the Android app, which a large portion of China's population will be able to access. Researchers [estimate](#) that more than 95 percent of people accessing the internet in China use mobile devices to go online, and Android is [by far](#) the most popular mobile operating system in the country, with 80 percent of the market share.

The documents seen by The Intercept suggest that Google will operate the search app as part of a joint venture with an unnamed partner company, which will presumably be based in China. However, much of the work on the Dragonfly project is being carried out at Google's Mountain View headquarters in California, about 14 miles northwest of San Jose, the heart of Silicon Valley. Other teams participating in the project are based out of Google offices in New York, San Francisco, Sunnyvale, Santa Barbara, Cambridge, Washington, D.C., Shanghai, Beijing, and Tokyo.

PREVIOUSLY, BETWEEN 2006 and 2010, Google had maintained a censored version of its search engine in China. At the time, the company faced severe criticism in the U.S. over its compliance with the Chinese government's policies.

During a February 2006 [congressional hearing](#) that focused on the activities of American technology companies in China, members of the House International Relations Committee called Google a functionary of the Chinese government and accused it of abhorrent actions for participating in censorship. Google has seriously compromised its don't be evil policy, declared Rep. Chris Smith, R-N.J. Indeed, it has become evil's accomplice.

The controversy eventually became too much for Google. In March 2010, it announced that it was pulling its search service out of China. In a [blog post](#) published at the time, the company cited Chinese government efforts to limit free speech, block websites, and hack Google computer systems as reasons why it could no longer continue censoring our results.

Sergey Brin, Google's co-founder, was born in the Soviet Union and seemed particularly sensitive to concerns around censorship, having had personal experience under a repressive regime. After Google ceased its search service in 2010, Brin [said](#) that the company's objection related to "forces of totalitarianism," and added that he hoped the decision to pull the search platform out of the country would help lead to a "more open internet."

"Companies operating in China must be prepared to turn over user data to security agencies."

Since then, however, censorship and surveillance in China has become more pervasive. In 2016, the country's government passed a new cybersecurity law, which Human Rights Watch [said](#) "strengthens censorship, surveillance, and other controls over the internet." The government is using new [automated systems](#) to monitor and censor the internet, and it has [cracked down](#) on privacy technologies that Chinese people were using to circumvent the restrictions.

"It has been a requirement that companies operating in China must be prepared to police their users and turn over user data to security agencies upon request," said Ron Deibert, director of Citizen Lab, an internet research group based at the University of Toronto. "We have also found overall that internet censorship [in China] is evolving towards less transparency, with less notification to users when messages are censored or removed across all platforms."

Despite the continued repression, opinions have changed at the highest levels of Google. China now has more than 750 million internet users, equivalent to the entire population of Europe. It therefore represents a potentially massive revenue stream for the internet giant, which is likely a factor in its decision to relaunch the search platform in the country.

[Learn more](#)

Another reason for the planned policy reversal may be that since Google last operated its search tool in China, the company's leadership structure has markedly changed. Co-founders Brin and Larry Page have adopted less hands-on roles, though they still serve on the company's board of directors.

Google's China rapprochement has been spearheaded by Pichai, Google's current CEO, a 46-year-old Indian-American who took the helm in October 2015. At a June 2016 conference in southern California, Pichai made his intentions clear. "I care about servicing users globally in every corner. Google is for everyone," he said. "We want to be in China serving Chinese users."

In December 2017, sources say Pichai traveled to China and attended a private meeting with Wang Huning, a leading figure in the Communist Party. Huning is President Xi's top foreign policy adviser and has been described as "China's Kissinger." Pichai is said to have viewed the meeting as a success. The same month, Google [announced](#) that it was launching an artificial intelligence research center in Beijing. That was followed in May 2018 with the [release](#) of a Google file management app for Chinese internet users. Then, in July, Google [rolled out](#) a "Guess The Sketch" game on WeChat, a popular Chinese messaging and social media platform.

The finale would be the launch of the search app "the Dragonfly project." According to sources familiar with the plans, timing for the app's release will depend on two main factors: approval from the Chinese government and confidence within Google that its app will be better than the search service offered by its

main competitor in China, Baidu.

Google insiders say that it is not known when the company will obtain the approval from officials in Beijing because an escalating trade war between the U.S. and China has slowed the process. However, Google's search engine chief Ben Gomes told staff at a meeting last month that they must be ready to launch the Chinese search app at short notice, in the event that suddenly the world changes or [President Donald Trump] decides his new best friend is Xi Jinping.

Google and the Chinese government's Ministry of Foreign Affairs did not respond to multiple requests for comment on this story.

The man who visited North Korea a few times while working with Obama Admin. Wonder what he was up to there...

Speaking to Google, I would ask about the secretive visit of Google Chairman Eric Schmidt to North Korea in 2013. Then, the North Korean regime was on life watch. Now, just four years later, North Korea has an intercontinental ballistic missile, a thermonuclear bomb, and a cyber-warfare corps.

Eric Schmidt was accompanied by Bill Richardson, a former Democrat governor of New Mexico. At that time Richardson was on the boards of World Resources Institute and the National Council for Science and the Environment. Coincidentally, the Obama administration closed an anti-trust probe of Google just a few days before that visit, despite the written recommendation to file a civil lawsuit against Google, made by the bureau of competition in 2012 (2). Well, many things happened in that time frame.

GOOGLE PUSHES TRANNIES BECAUSE LARRY PAGE AND MOST GOOGLE EXECS LOVE TRANNIES

Google is selectively targeting people to turn them INTO trannies. The search pages, the ads, the entertainment are all warped to push certain ideas into certain people's heads. Google selected him to be a tranny. What did their AI select you to be? I would imagine the thing targets everybody with tailor made degeneracy. It attacks your brain like a rubics cube trying to turn you into their creation.

If you would like to isolate the effect, you might try connecting through a VPN, and using something like Firejail, with Firefox operating in "double" private mode. This will prevent any memory from writing directly to your disk and from Google's scripts from being able to see your files directly. You will have to login each time and it won't store your information. But at least then you can get an idea of what your searches would be like if you weren't you.

OF course we all know google is really using the control processor on your computers microchip to tag all your network connections, so the CIA or NSA always knows its you . You're only really blind to the advertising and commercial sides of the organization. Also they can identify some network traffic regardless of encryption.

GOOGLE SAYS THEY CAN DESTROY TRUMP, OR ANY POLITICIAN, WITH THE PUSH OF A BUTTON!

- Google was "*built to manipulate the masses*"

Dr. Robert Epstein, the senior research psychologist at the American Institute for Behavioral Research and Technology, joined Breitbart Newsâ Editor-in-Chief Alex Marlow on *Breitbart News Daily* to discuss how Google hopes to shift 10 percent of the voting public away from Trump to fulfill a company executiveâs stated goal of making populism nothing more than a â blip in history.â

[Dr. Robert Epstein](#), the senior research psychologist at the American Institute for Behavioral Research and Technology, appeared on Breitbart News Daily alongside host and Breitbart News Editor-in-Chief Alex Marlow to discuss how Silicon Valley companies manipulate algorithm to suppress content.

Discussing Googleâs efforts to suppress conservative content, Marlow states: â None of this is gonna come as a surprise to this audience but I donât think a lot of people by and large understand exactly how much they can manipulate you, Google can, with just a slight tweak to search results or search suggestions or

their algorithmâ Everyone knows by the Breitbart leak of the [Google TGIF meeting in 2016](#) right after the election that they said they wanted populism to be a blip in history, they wanted to basically use their power to make sure populism doesnât have long term effects, what does that mean?â Since then Breitbartâs reach has wildly diminished within Google, this cannot be a coincidence.â

Dr. Epstein replied: â I doubt that itâs a coincidence because itâs so easy for them to suppress content of any sort. I published a big article on this in 2016 called [The New Censorship](#), I focused on nine of Googleâs blacklists, this is without ever seeing one and without the company admitting they had such things. But last year, Zach [Vorhies left the company, quit the company and took with him 950 pages of documents](#) and a video and two of those documents were Googles blacklists.â

â People donât understand how big this threat is, you mentioned that leak, that video that you exposed which was quite astonishing. One of the things that was said there by one of their top executives is â weâre going to use every means at our disposal, all of Googleâs power to make sure Trump isnât re-electedâ so if theyâre using every single means at their disposal, then theyâre using all of the techniques that Iâve discovered and probably more that I havenât discovered yet. Thatâs enough to [shift roughly ten percent of the voting population of the United States](#) with no one knowing theyâre being manipulated and no paper trail for authorities to trace.â

Dr. Epstein then outlined how he and his team fo researchers are developing a new monitoring system to track YouTube and the content that YouTubeâs algorithm is suggesting to users. â We will be capturing what theyâre doing in real-time as its occurring,â said Epstein. â Normally you canât do that, because think about it, when you do a search on Google or see a newsfeed on Facebook thatâs generated on-the-fly just for you, it affects you, it disappears and itâs gone, itâs not stored anywhere. So thereâs no trace of it, you canât go back in time and see what these companies are showing people, you canât see the manipulations as theyâre all ephemeral, theyâre fleeting.â

Dr. Epstein has been at the forefront of tracking Googleâs election manipulation. At the Breitbart News Masters of the Universe Town Hall in 2018, Epstein warned that most Americans have â no idea of the extent of the surveillanceâ that Google and other tech companies perform on our daily lives.

[Google](#) engineers discussed on email changing algorithms to disfavor conservative publications after [Donald Trump](#) won the 2016 presidential election, it has been claimed.

[The Daily Caller](#) â a conservative website â claimed both their outlet and Breitbart were singled out as sites to potentially bury after some Google employees suggested may not have deserved a prime spot on the search engine's result.

According to the publication, on November 9 after [Hillary Clinton](#) lost her bid for the White House, liberal employees shared emails that conspired to reduce the search result visibility even if articles contained useful information that would usually be featured prominently.

The publication claims to have viewed internal emails between Google employees that label the news outlet - founded by Tucker Carlson and Neil Patel in 2010 - an 'opinion blog,' which they say is a false statement.

The right-wing Breitbart News Network was also given the same treatment according to The DCNF.

Google engineers allegedly discussed changing the algorithm of search results in reaction to Donald Trump winning the 2016 presidential election against Hillary Clinton

'This was an election of false equivalencies, and Google, sadly, had a hand in it,' engineer Scott Byer wrote, according to DCNF.

'How many times did you see the Election now card with items from opinion blogs (Breitbart, Daily Caller) elevated next to legitimate news organizations? That's something that can and should be fixed.'

'I think we have a responsibility to expose the quality and truthfulness of sources â because not doing so hides real information under loud noises,' Byer is said to have continued. 'Beyond that, let's concentrate on teaching critical thinking. A little bit of that would go a long way. Let's make sure that we reverse things in four years â demographics will be on our side.'

The DCNF added in their report that even liberal employees spoke up against the suggested action.

One is said to have warned that limiting access to a range of views would only fuel conspiracy theories from the far right and pointed out that the likes of the Drudge Report may have started as small news aggregation operations but are now highly regarded by many.

'Thinking that Breitbart, Drudge, etc. are not 'legitimate news sources' is contrary to the beliefs of a major portion of our user base is partially what got us to this mess. MSNBC is not more legit than Drudge just because Rachel Maddow may be more educated / less deplorable / closer to our views, than, say Sean Hannity,' engineer Uri Dekel is said to have written.

'I follow a lot of right wing folks on social networks you could tell something was brewing. We laughed off Drudge's Instant Polls and all that stuff, but in the end, people go to those sources because they believe that the media doesn't do its job. I'm a Hillary supporter and let's admit it, the media avoided dealing with the hard questions and issues, which didn't pay off. By ranking 'legitimacy' you'll just introduce more conspiracy theories.'

+2

•

According to the publication, on November 9 liberal employees shared emails that conspired to reduce the visibility of some websites

However it's claimed Byer argued both MSNBC and Brietbart echo 'made up' stories and insisted the aim was to 'break the myth feedback loop, the false equivalency'.

Another Google employee suggested improving the visibility of just original sources instead of displaying a number of articles from websites using the same information, hence flooding the search engine with numerous stories that express the same view.

Engineer Mike Brauwerman is reported to have said a 'comprehensive but effectively summarized view' not 'context-free rage-inducing sound-bytes' would be more helpful.

Vice president of engineering at Google, David Besbris, chimed in to say he aim was indeed to give people a well-rounded view of the political information available online.

'We're working on providing users with context around stories so that they can know the bigger picture,' he explained according to TheDCNF.

'We can play a role in providing the full story and educate them about all sides. This doesn't have to be filtering and can be useful to everyone.'

One Google engineer reportedly said: 'MSNBC is not more legit than Drudge just because Rachel Maddow [pictured left] may be more educated / less deplorable / closer to our views, than, say Sean Hannity' (pictured right)

Google engineers Uri Dekel (left) and Mike Brauerman (center) allegedly agreed it wasn't a good idea to limit visibility of some websites. Vice president of engineering at Google, David Besbris (right), said his aim was to give people a well-rounded view

Google denied that the internal conversations showed they push a liberal agenda.

A representative went as far as saying employees couldn't change results to their liking due to strict rules they have in place.

'This post shows that far from suppressing Breitbart and Daily Caller, we surfaced these sites regularly in our products. Furthermore, it shows that we value providing people with the full view on stories from a variety of sources,' the spokesperson emailed DailyMail.com after reaching out for comment.

'Google has never manipulated its search results or modified any of its products to promote a particular political ideology. Our processes and policies do not allow for any manipulation of search results to promote political ideologies.'

President Trump claimed in August that the search engine tried to harm his campaign by only giving 'fake news' prominence.

In a Twitter post that has since been deleted he said 'they are controlling what we can & cannot see'.

'Google search results for 'Trump News' shows only the viewing/reporting of Fake New Media. In other words, they have it RIGGED, for me & others, so that almost all stories & news is BAD. Fake CNN is prominent,' he posted. 'Illegal? 96% of the results on 'Trump News' are from National Left-Wing Media, very dangerous. Google & others are suppressing voices of Conservatives and hiding information and news that is good. They are controlling what we can & cannot see. This is a very serious situation-will be addressed!'

He later continued to reporters: 'Google has really taken advantage of a lot of people and I think that's a very serious thing and it's a very serious charge,' Trump told reporters after a meeting with the president of FIFA. 'They better be careful because they can't do that to people.'

At the time Google denied his claim and said in a statement the search results are 'not used to set a political agenda and we don't bias our results toward any political ideology'.

GOOGLE SOCIOPATHS RIG THE INTERNET AGAINST POLITICAL OPPONENTS USING CIA TECHNOLOGIES

Trump vows to address Google search allegedly rigging the media against him

[Alex Lockie](#)

Donald Trump is interviewed in New York, April 2011. [Richard Drew/AP](#)

- **President Donald Trump vowed to address Google allegedly using search results to show "Fake News Media" in a bid to suppress conservative voices in a manner he called "very dangerous."**
 - **Trump has previously called out Twitter for "shadow banning" prominent conservatives, saying the practice was "illegal" and his administration would look into it.**
 - **As Google search represents a product from the Alphabet Company, a publicly traded company, it's unclear how the US government could address or direct its largely automated service to behave differently.**
-

President Donald Trump vowed to address Google allegedly using search results to show "Fake News Media" in a bid to suppress conservative voices in a manner he called "very dangerous."

From [Trump's Twitter on Tuesday morning](#):

"Google search results for "Trump News" shows only the viewing/reporting of Fake New Media. In other words, they have it RIGGED, for me & others, so that almost all stories & news is BAD. Fake CNN is prominent. Republican/Conservative & Fair Media is shut out. Illegal? 96% of results on "Trump News" are from National Left-Wing Media, very dangerous. Google & others are suppressing voices of Conservatives and hiding information and news that is good. They are controlling what we can & cannot see. This is a very serious situation-will be addressed!"

Trump has previously called out Twitter for "shadow banning" prominent conservatives, saying the practice was "illegal" and his administration would look into it.

Trump's 96% figure appears to come from a [PJMedia, a conservative opinion blog that wrote on Saturday](#) a blog which used unscientific methods to estimate that 96% of Trump news Google search results come from liberal media outlets.

The US media has long stood accused of a generally liberal bias by the Republican party, and the most read and viewed US media platforms excluding Fox News and the Wall Street Journal all consistently rank mildly liberal by independent media reviewers such as the Columbia Journalism Review.

As Google search represents a product from the Alphabet Company, a publicly traded company, it's unclear how the US government could address or direct its largely automated service to behave differently.

Google did not immediately respond to a request for comment from Business Insider.

GOOGLE STAFF TELL BOSSES CHINA CENSORSHIP IS MORAL AND ETHICAL CRISIS

[Ryan Gallagher](#)

Illustration: Soohie Cho/The Intercept

GOOGLE EMPLOYEES ARE demanding answers from the company's leadership amid growing internal protests over plans to launch a censored search engine in China.

Staff inside the internet giant's offices have agreed that the censorship project raises an urgent moral and ethical issues and have circulated a letter saying so, and calling on bosses to disclose more about the company's work in China, which they say is shrouded in too much secrecy, according to three sources with knowledge of the matter.

The internal furor began after The Intercept earlier this month [revealed details](#) about the censored search engine, which would remove content that China's authoritarian government views as sensitive, such as information about political dissidents, free speech, democracy, human rights, and peaceful protest. It would blacklist sensitive queries so that no results will be shown at all when people enter certain words or phrases, leaked Google documents disclosed. The search platform is to be launched via an Android app, pending approval from Chinese officials.

The censorship plan code-named Dragonfly was not widely known within Google. Prior to its public exposure only a few hundred of Google's 88,000 employees had been briefed about the project around 0.35 percent of the total workforce. When the news spread through the company's offices across the world, many employees [expressed anger and confusion](#).

Now, a letter has been circulated among staff calling for Google's leadership to recognize that there is a code yellow situation a kind of internal alert that signifies a crisis is unfolding. The letter suggests that the Dragonfly initiative violates an internal Google artificial intelligence ethical code, which says that the company will not build or deploy technologies whose purpose contravenes widely accepted principles of international law and human rights.

Google employees need to know what we're building.

The letter says: Currently we do not have the information required to make ethically-informed decisions about our work, our projects, and our employment. That the decision to build Dragonfly was made in secret, and progressed with the [artificial intelligence] Principles in place, makes clear that the Principles alone are not enough. We urgently need more transparency, a seat at the table, and a commitment to clear and open processes: Google employees need to know what we're building.

The letter goes on to demand an ethics review that includes rank and file employee representatives, the appointment of an ombudsperson to oversee the process, a plan for more transparency to be instituted across the company so that employees can make ethical choices about what they choose to work on, and ethical test cases assessing the Chinese censorship plans. The effort to write and circulate the letter was partly led by a group of Google employees who previously [protested](#) the company's work with the U.S. military to build artificial intelligence that could identify vehicles and other objects in drone footage. That protest was successful and led to Google allowing its contract with the military to expire.

Many Google employees are members of the Association of Computing Machinery, the world's largest organization for computing professionals. The ACM's ethical code states that its members should take

action to avoid creating systems or technologies that disenfranchise or oppress people and use their skills for the benefit of society. Two Google sources told The Intercept that they felt the Dragonfly project clearly violated the ACM's code of ethics, which has led them to support the protests inside the company against the planned China censorship.

Google's leadership has still not spoken to employees about Dragonfly, according to the sources, who spoke on condition of anonymity because they were not authorized to contact the media. Publicly, Google's press office has declined to answer any questions from reporters about the censorship, and has said only that it will not comment on speculation about future plans.

The silence from Google bosses appears to have fueled anger within the company. Discussion has raged among Google employees, with some questioning their managers, only to be told that details about Dragonfly cannot be shared. It has emerged that at least one Google staffer who worked on Dragonfly left the company partly due to concerns about the project, and another employee who was asked to work on it refused to do so.

This week, hundreds of Google employees shared an essay authored by Brandon Downey, a former Google engineer who says he worked for the company on an earlier version of its censored Chinese search platform. Google launched a censored search engine in China in 2006, but pulled the service out of the country in 2010, citing Chinese government efforts to limit free speech, block websites, and hack Google's computer systems. Downey's essay, [which he published online](#), criticizes the censorship, and calls on Google not to make the same mistake twice by launching Dragonfly.

"I want to say I'm sorry for helping to do this," Downey wrote. "I don't know how much this contributed to strengthening political support for the censorship regime in [China], but it was wrong. It did nothing but benefit me and my career, and so it fits the classic definition of morally heedless behavior: I got things and in return it probably made some other people's life worse."

"We have a responsibility to the world our technology enables," Downey adds. "If we build a tool and give it to people who are hurting other people with it, it is our job to try to stop it, or at least, not help it. Technology can of course be a force for good, but it's not a magic bullet—it's more like a laser and it's up to us what we focus it on. What we can't do is just collaborate, and assume it will have a happy ending."

Google is facing mounting pressure both inside and outside the company. The Dragonfly plan has been condemned by a bipartisan group of six U.S. senators and several human rights groups, including Amnesty International and Human Rights Watch.

Google has not yet responded to questions posed by the human rights groups or senators, sources said. However, the company has in recent days engaged with the Global Network Initiative, or GNI, a digital rights organization that works with a coalition of companies, human rights groups, and academics.

Google is signed up as a member of the GNI, which means that it has committed to implementing a set of principles on freedom of expression and privacy. The principles appear to prohibit complicity in the sort of broad censorship that is widespread in China, stating that member companies must "respect and work to protect the freedom of expression rights of users when they are confronted with government demands to remove content or otherwise limit access to communications, ideas and information in a manner inconsistent with internationally recognized laws and standards."

Google will have to explain to the GNI how its plan to launch a censored search in China is consistent with the initiative's principles. In response to questions from The Intercept, the GNI refused to discuss its interactions with Google. However, Judith Lichtenberg, the group's executive director, said in a statement: "All member companies are expected to implement the GNI principles wherever they operate, and are

subject to independent assessment, which is overseen by our multi-stakeholder board of directors.â

Cynthia Wong, a senior researcher at Human Rights Watch, is one of the representatives on the GNIâ s board of directors. Wong told The Intercept that Google â owes the Chinese people an explanation of how the firm can launch Dragonfly without being conscripted into human rights abuses.â

Wong added: â Google earned a lot of good will from the human rights community with they stopped censoring search in 2010. Yet the human rights situation has only deteriorated in the years since. If it re-enters now without any clear strategy as to how its services will improve human rights, it would be a victory for [President] Xi Jinpingâ s regime and will only serve to legitimize the governmentâ s abusive approach. We havenâ t yet heard any such strategy.â

Google did not response to a request for comment on this story.

Cat Fight! How These Inventors Beat the Counterfeiters That Nearly Destroyed Their Company.

When a company copied their invention, Natasha and Fred Ruckel began investigating -- and got an inside look into how products are ripped off.

This story appears in the [July 2018](#) issue of [Entrepreneur](#). [Subscribe Â»](#)

On Valentine's Day in 2015, Natasha Ruckel and her husband, Fred, were sitting in their living room in Gilboa, N.Y. Natasha was improvising on the piano, and Fred was listening while messing around with the couple's cat, Yoda. Fred noticed a ripple in the living room rug, forming a half circle on one side. Again and again he tossed toys into the ripple and a delighted Yoda darted in and out. Natasha looked up from her playing. "That's when we came up with the [idea](#) for the Ripple Rug," she says.

Related: [7 Audacious Startup Ideas That Eventually Became Wildly Successful](#)

The Ruckels, who had spent around 25 years earning their living in marketing and advertising for brands from PepsiCo to ESPN to Hasbro, were already in the midst of creating their first venture: an [app](#) that provided a way for amateur photographers to monetize online images. But they both agreed that the Ripple Rug was a better bet.

A couple of days later, Fred went to Home Depot and bought some cheap pieces of carpet, and they got to work on a prototype. When they had that, they launched a [Kickstarter](#) campaign in May 2015, pricing the American-made product at \$39.95, to test the market. Within 30 days, they received \$15,000 in backing. They had the products made in Georgia for \$15 each, and filled the orders.

The Ruckels were weighing their next step when, that fall, the opportunity of a lifetime hit. QVC, in conjunction with the *Today* show, hosted an ongoing competition called the "Next Big Thing" for entrepreneurs with new retail products. Participants presented their offerings on the TV program, and the winning products received an order from QVC.

Following an arduous vetting process -- including proof of a multi-million-dollar insurance policy, a guarantee of having 1,500 items available for sale and sample videos of the Ruckels in pitch mode -- Ripple

Rug made the cut. â We drove into New York City, and at every exit, we practiced the pitch,â Fred remembers. â We were there by 5 a.m. and hardly slept the night before.â

They sold a few hundred units immediately. QVC bought 1,500 more and Ripple Rug became a top seller. â It was pretty damned amazing,â says Fred. â We were profitable out of the gate, which is virtually unheard of. It felt like a great moment.â

It was, and it wasnâ t. Over the next 14 months, the Ruckels learned that coming up with a truly original innovation attracts not only devoted customers but also the kind of highly organized, deep-Â-pocketed bootleggers who rip off products and systematically grind their inventors into the ground -- both financially and emotionally. â It creates so much discord that you are willing to give up the dream of entrepreneurship and go back to your day job,â says Fred.

In the thick of battle, however, the Ruckels learned critical lessons: the importance of copyrighting assets before launching; the reality that people will steal everything from your marketing pitch to your product to your advertising photos; the need to continually patrol for ripoffs and take action. They also got a darkly fascinating glimpse of how ruthless, well-funded, deeply sophisticated bootlegging operations work -- and how, with tenacity, vigilance, a good lawyer and the right strategy, they can be beaten.

The 2016 holiday season promised to be a beautiful one for Fred and Natasha. Sales had been rising month over month for most of the year. By October they had sold nearly half a million dollarsâ worth of their product. They expected to sell 4,000 Ripple Rugs between Thanksgiving and New Yearâ s Day. They were so certain of it that they put \$80,000 into producing fresh inventory.

So when only 2,000 units sold, Fred was confused. â I planned it right -- advertising on social media, getting influencers talking, making best-of lists -- and couldnâ t understand what went wrong,â he says. Heâ d worked on hundreds of campaigns before; he knew what he was doing. But he couldnâ t explain this. â Something weird was going on.â

In February 2017, a friend told the Ruckels that his accountant had seen their commercial on TV, but he wondered why the product being advertised had a different name. The Ruckels told him they hadnâ t aired a TV commercial. Suddenly feeling nauseated, Fred had his friend place a call to the accountant. â She told me that she saw a commercial for something called the Purr N Play, which was just like the Ripple Rug,â Fred says. â She thought it could have been ours, but it wasnâ t.â

The Ripple Rug may have been an upstart product, but Fred had a key advantage. He had spent years sidelining as an I.T. forensics specialist for hire by attorneys. â I viewed this [theft] as no different from one of those jobs,â says Fred. â The plan was to investigate and put all the pieces together in order to show the crime that was perpetrated.â There was no simple way to do this, though, so the Ruckels would have to dig layer by layer, starting with what was in front of them.

First up: the website. The couple found the site selling the Purr N Play -- at two for \$19.99, plus shipping and handling. Using a friendâ s name and credit card (so as to not spook the bootleggers), the Ruckels placed an order. A confirmation was emailed to them, along with this strange note: â We are sorry, this product is on back order. We will notify you when stock is available. Your credit card will not be charged until the product is available and shipped.â The credit card wasnâ t charged, but there was no way to cancel the order, either.

Next, employing Photoshop, they went frame by frame through the commercial -- which ran online and on TV -- and made a stunning discovery. In several of the shots of the cat toy, the Ruckels spotted the Ripple Rug logo? "We assumed they had manufactured a copy of our rug and sold a ton of them," says Fred; hence, the back order. "But it wasn't a knockoff. It was *our* product!" The mystery had deepened.

The Ruckels then uncovered the source code on the Purr N Play's website, which led them to the site's developer. They did a search for other sites made by that company and found that many were simple sites, like the Purr N Play's, built to sell bootlegged products. Fred placed a call to the web company and told them the product had been hijacked, that it belonged to him. "I told them that the site needs to come down," Fred says. The site builder agreed to comply, but this wasn't the company that knocked off the Ripple Rug. It was just doing work for hire.

The next step was to figure out who made the commercial. It depicted three cats playing with the toy, and two middle-aged women giving testimonials, all set in a house. That was a clue. "We looked online for people who owned commercial locations that matched those used in the videos," says Fred. "We also hunted for notices from people seeking locations that would match those used in the ads: full living rooms where cats would be welcome."

Related: [How to Overcome Common Challenges and Help Your Small Business Grow](#)

Natasha searched for kitten casting calls and the cats featured in the commercial. She also looked for casting calls that sought women in their 40s who could provide product testimony -- the kind of thing a professional videography company would have posted before making this commercial. Bingo: Natasha uncovered a December 14 casting call requesting kittens on Facebook. It was for the Purr N Play commercial. That detail led her to the website of a cat fostering center that had provided the felines used in the videos. Fred contacted the foster center's owner and explained what had happened. "She said her mind was blown," he says. "She confirmed the production and where it was shot. Then, all of a sudden, she turned a cold shoulder and had a lawyer reach out to us."

Soon after, on a hunch, Fred began looking into people who, in recent months, had contacted him about doing discount deals related to the Ripple Rug. One was an operation called *The Bargain Show*, a low-rent online version of QVC. As Ripple Rug sales were tanking, a *Bargain Show* representative repeatedly inquired about working together. "We believe the Ripple Rug could be a great fit for our online shopping network," he wrote. "Nothing beats cute animals on video!"

The timing struck Fred as curious, so he reached out to the rep. When the man called back, the caller ID read "Opfer Communica," according to a photo taken by Fred. The Ruckels looked up Opfer Communications, which makes infomercials, and found that the sets featured on *The Bargain Show* matched those used for the Purr N Play. (Opfer's lawyer, Bernie Rhodes, argues that *The Bargain Show* was merely running infomercials made by Opfer, but otherwise "had nothing to do with Opfer Communications.")

Fred connected with a manager at Opfer. "Point blank, I told him that he had ripped off our product," he says. "The guy's voice remained completely level. He didn't get rattled. He said he would have to talk to some people and get back to us. But he never did."

At this point, by the end of February, Ripple Rug sales were in free-fall. Fred and Natasha strategized about what to do with their suddenly deep inventory. They discussed liquidating their 401(k)s or taking out a home equity loan. They had a whole wall of their house covered in Post-it Notes, trying to connect the dots on this bootlegging operation.

And then, a break. After several calls to the web design company, they managed to connect with its CEO. "He gave up the man who had hired him," says Fred. It was, Fred was told, a guy named Ronald

Steblea, head of a Connecticut company called Rutledge & Bapst. Much later, from a letter sent to the Federal Trade Commission from a staff attorney with Connecticut's Department of Consumer Protection, the Ruckels would gain some insight into Steblea: A previous company for which he served as president had already weathered a \$7.5 million judgment against it for deceptive business practices. That attorney described Rutledge & Bapst as appearing to be an "enterprise whose overall business model is marketing bootleg products while using the images and goodwill of bona fide products like Ripple Rug."

At the end of March 2017, Fred and Natasha Ruckel launched a lawsuit. And over the course of the next year, the Ruckels used the legal discovery process to lift the rock under which Steblea operates, gaining a rare look into how an operation like his works.

Most inventors, Fred says, "figure that their products failed because the products were no good. Not because somebody stole the idea, made it cheaper, out-marketed them, and undersold the originals." The scam companies, he discovered, are often rich enough to put \$200,000 into marketing a knocked-off product. "Imagine having that kind of money when the guy who made the real invention operates on a shoestring."

The Ruckels' lawyer, Paula Brillson Phillips, a managing partner at Digital Law Group, who has worked on more than 50 of these instances, sums up the stakes more simply. "Independent inventors," she says, "are lambs to the slaughter."

Image Credit: David Yellen

When most consumers think of counterfeits, they likely think of big-brand knockoffs: fake Nikes, Rolexes or luxury handbags, which flood out of places like China and onto street corners around the world, contributing to an estimated \$500 billion in global counterfeit sales per year. There's a reason for that, says Joseph Gioconda, attorney at New York-based Gioconda Law Group, which specializes in brand protection. "The counterfeiter is looking to do the least amount of work for the biggest amount of money without any regard for law or morality," he says. Big brands have a built-in marketplace. They're as close to a guaranteed sale as a counterfeiter can get.

But in certain circumstances, small brands can appear to offer the same guaranteed reward -- if, for example, like the Ripple Rug, they appear on television shows or rise through the ranks of Amazon best-sellers. In these cases, Gioconda says, the threat is often more homegrown: People who knock off small American products may be based in America themselves, he says, and they build sophisticated operations to help them move fast. They often retain intellectual property lawyers of their own, who make small tweaks to an existing product that gets the counterfeiter around whatever patent the inventor is holding. Or, if the inventor doesn't hold a patent, they move faster than intellectual property law can -- knocking off a product and getting it to market before an inventor can protect their idea.

Based on documentation that the Ruckels received from Rutledge & Bapst over the course of the lawsuit, this appears to be how the Ripple Rug landed on Rutledge & Bapst's radar. Internal emails show Rutledge & Bapst employees treating it like a matter of course, as if they're just any product-based company testing a new concept. "Please see attached and below for a new item we're testing called Purr N Play," one writes on January 20, 2017. "I will review this and get things rolling on it!" another replies.

Here, based on an analysis of hundreds of pages of that documentation, is what appears to have unfolded as Rutledge & Bapst allegedly attempted to counterfeit the Ripple Rug.

When the Ripple Rug came to Rutledge & Bapst's attention, it likely checked all the boxes: catchy product, independent inventors, patent pending. They hired the aforementioned web design firm to create a simple website for what had been dubbed the Purr N Play, which mimicked the language, color scheme and photography of the Ripple Rug's site -- even using an image of Yoda, the Ruckels's own cat. An email blast was then sent out to just less than a million people, as a way to test the toy's market potential. The results were good. Purr N Play had customers waiting.

What comes next is the matter of some dispute. In early 2016, as documents show, Rutledge & Bapst reached out to Opfer Communications to propose working together on the Purr N Play. Scott Opfer, head of the firm, then emailed an underling: "This is a product sent to me from Ron. He owns the product and has asked us if we want to partner with him. We do the spot for nothing and he buys the test media. If it works, we'll split the profits." (Rhodes, Opfer's lawyer, tells *Entrepreneur* that the two companies are regular collaborators, but that Opfer never suspected the product was a bootleg, and that their involvement didn't go any further than making the ad. Though he concedes, "They may have had some alternative fee arrangement.")

Next, on August 26, 2016, Opfer sent Rutledge & Bapst a contract to create an infomercial for Purr N Play. "Thanks, Ron," wrote the Opfer employee emailing the agreement to Steblea. "Thrilled to continue to work with you and your team to do fun things." Opfer got to work on the infomercial. A script was circulated, containing a claim about how the Purr N Play was made of "veterinary grade material." "It looks great," a Rutledge & Bapst employee wrote to Scott Opfer in January 2017. "Just one question about the veterinary grade material -- is this actually a thing? Or was this a term you created? From a claims standpoint, I just want to make sure we are OK."

"Pulled that straight out of my ass," Opfer replied. "We can dump it."

It appears that the bogus line didn't make it into the final video. (Rhodes claims it is standard practice in the infomercial business for the producer to make claims in a script, and then have the client strike them if they're false.)

A rough of the ad was produced, and a Rutledge & Bapst staff member emailed it to another for feedback. The latter employee was elated. "Hi, Ron sent it to me last night. I think it is awesome. The part where the 3 kitten heads pop out is adorable and made me laugh. Love it!!" She then added, "Just hope if it works we'll be able to manufacture it."

Read that sentence again. Fred had initially worried the Purr N Play was back-ordered because his antagonist had sold so many of them. But in reality, Rutledge & Bapst *didn't have any product to sell*. As it turns out, even before Rutledge & Bapst was preparing to advertise the product, the company was struggling to manufacture it.

Rutledge & Bapst had purchased the original Ripple Rug legitimately and had it shipped directly to a representative in China, who was working to arrange production. This is common, Brillson Phillips says. "China is where the bulk of counterfeit manufacturing takes place," she says. "There's usually somebody on the ground orchestrating things, and somebody in the United States directing the operation." In this case, however, multiple Chinese factories were unable to re-create the product. The Ruckels's lawsuit turned up a running email exchange between a Rutledge & Bapst employee and a representative in China. The representative says they're struggling to replicate the label "on the original product"; a Rutledge & Bapst employee replies, "No problem, we don't need the label." The rep says two of the factories said the Ripple Rug's raw material is quite expensive; the employee says to try a cheaper material; the rep sends an estimated cost per unit; Rutledge & Bapst pushes to get that number below \$4, even if it means making the rug smaller. The rep alerts Rutledge & Bapst that a cat they are using to test the knockoff prototype is struggling to get around and beneath the top layer, which was apparently too

soft to ripple properly.

These delays appear to be what saved Fred and Natasha's business. The Purr N Play ad campaign may have been going well -- Rutledge & Bapst spent more than \$8,000 to run the ad during reruns of Hallmark *Murders & Mysteries* shows and other programs that would attract older consumers -- but before a Chinese manufacturer had figured out how to make it, the Ruckels had alerted the U.S. government to the problem. The couple hoped that shipments of the knockoffs would be stopped when they were trying to enter the country.

Had the products made it into the States, they might have even made it onto retail shelves, says Gioconda, the brand protection lawyer. That's because "As Seen on TV" sections are often something of the Wild West of retail. The phrase sounds like it connotes some authority, but it's actually generic; no one entity owns the phrase, and it can be applied to just about anything. Oftentimes, a questionable marketing company will buy shelf space in retailers across the country, mark that space "As Seen on TV," and then stock the shelves with bootlegged products. "I've seen that happen at least several dozen times," Gioconda says.

But in the Ruckels' case, they sued before the Purr N Play was ever made. On February 23, 2017, an attorney for Rutledge & Bapst responded that they have "discontinued all efforts to manufacture, market and otherwise promote its Purr N Play product and all use of its direct response television commercial advertising that product." On March 1, Opfer also agreed to cease marketing it. The lawsuit went on, but the Purr N Play, a nonexistent product that caused no end of havoc, was, at long last, no more.

But the Ruckels didn't just want these companies to stop; they wanted compensation for the lost Ripple Rug sales. The case ground on for months. Finally, in August 2017, nearly five months after the suit had been initiated, the two sides agreed to talk about a settlement. The Ruckels and Ron Steblea sat down in a judge's chambers at the Federal Courthouse in Bridgeport, Conn. Across a conference-room-style table, the couple and their lawyers tensely confronted their adversary and his lawyers. Fred remembers Steblea sitting with a smirk.

Fred asked Steblea what he was smiling about.

He recalls Steblea responding coolly: "It's nothing personal."

"It never is with thieves," said Fred.

Image Credit: David Yellen

In the end, the Ruckels won. On January 31 of this year, Steblea backed down and agreed to settle. And on February 20, the parties signed the agreement. The Ruckels say they received money in the settlement but, as part of the terms of the agreement, cannot say how much. The Ruckels still have pending claims against some of the other parties involved in the counterfeit. Steblea did not respond to multiple requests for comment.

Related: [How 3 Entrepreneurs Came up With Their Business Ideas](#)

Gioconda, who reviewed the Ruckels' lawsuit at *Entrepreneur's* request, says the couple did three things right that all other entrepreneurs should do, too: They filed for intellectual property protection very early, including trademarks and provisional design and patent applications; they hired good and aggressive lawyers; and, in telling their story in a venue like this, they're getting the word out that they strike back against bootleggers. "Counterfeiters pick their targets based on ROI, and they don't want to get sued or hassled," Gioconda says. "It's just easier to go after people who give up quickly."

How much the attempted bootlegging cost the Ruckels is difficult to estimate, but today, the Ripple Rug lives on. â Weâ re getting new colors in, and things are going really well,â says Fred. â Weâ re in with the best-sellers on Amazon.â

The Ruckels decided to put some of the lawsuit money toward creating an organization devoted to helping other product inventors who find themselves victimized by poachers. They named it the [Randy Cooper Foundation](#), after a late inventor whose health failed partly over the stress of his product design being stolen repeatedly. Bootleggers â work in the dark corners of the internet,â Fred says. â And I am right there, watching them.â

Clearly, he needs to. In May, three months after the Ruckels settled their lawsuit, Fred spotted something disturbing on Amazon -- a product called Vpets Cat Activity Play Mat that looked exactly like the Ripple Rug. â They copied our information word for word, even where it says â Ripple Rugâ in the descriptive text,â Fred wrote in an email. But he had notched one victory in this arena already. There was room for more.

â Today,â he wrote, â shall be a long day of digging in.â

GOOGLE STRUGGLES TO CONTAIN EMPLOYEE UPROAR OVER CHINA CENSORSHIP PLANS AS EMPLOYEES REALIZE THEY ARE JUST CORPORATE STOOGES

Ryan Gallagher

August 3 2018, 10:41 a.m.

Photo: Ng Han Guan/AP

GOOGLE BOSSES WERE scrambling to contain leaks and internal anger on Wednesday after the company's confidential plan to launch a censored version of its search engine in China was revealed by The Intercept.

Just a few hundred of Google's massive 88,000-strong workforce had been briefed on the project prior to [the revelations](#), which triggered a wave of disquiet that spread through the internet giant's offices across the world.

Company managers responded by swiftly trying to shut down employees' access to any documents that contained information about the China censorship project, according to Google insiders who witnessed the backlash.

"Everyone's access to documents got turned off, and is being turned on [on a] document-by-document basis," said one source. "There's been total radio silence from leadership, which is making a lot of people upset and scared. Our internal meme site and Google Plus are full of talk, and people are a.n.g.r.y."

On a message board forum for Google employees, one staff member posted a link to The Intercept's story alongside a note saying that they and two other members of their team had been asked to work on the Chinese censorship project, code-named Dragonfly.

"In my opinion it is just as bad as the leak mentions," the employee wrote, adding that they had asked their manager to be removed from the project because they were uncomfortable with it. Another member of the team, the employee said, had decided to quit Google in large part due to concerns about Dragonfly.

"I had a meeting with my [vice president] about the project before leaving [it]. This was a short meeting for me, because my [vice president] refused to provide any information without me basically agreeing to a verbal [nondisclosure agreement]," noted the employee. "She did reemphasize that they had good reasons to keep all that private: they didn't want the project to leak externally! That was enough for me to fuck off [from the group working on Dragonfly]."

"There's been total radio silence from leadership. A lot of people are upset and scared."

Google did not immediately respond to a request for comment on the backlash.

Following the disclosure on Wednesday, several new sources inside Google independently confirmed the plans to news organizations, including [Reuters](#), the [Wall Street Journal](#), the [New York Times](#), the [Financial Times](#), [Agency France-Presse](#), [Vice News](#), and [Bloomberg](#). One source who spoke to

Bloomberg [characterized](#) the project as a “censorship engine,” which they said they viewed as a betrayal of Google’s values. Bloomberg described a ferocious discussion among Google staffers, with some backing the company’s censored search proposal because they believed that boycotting the country would not “bring any positive change.”

Publicly, Google has so far stayed silent about Dragonfly. The company has refused to address dozens of reporters’ questions about the project, and has instead issued a boilerplate statement saying that it does “not comment on speculation about future plans.” One source said some members of Google’s search engine team were on a company trip to Lake Tahoe, between California and Nevada, at the time the news broke, which blindsided them and “spoiled some folks’ vacation.”

The Dragonfly project was launched in spring 2017. Since then, small teams of Google engineers have been developing a custom Android app, different versions of which have been named “Maotai” and “Longfei.” The app has been designed to filter out content deemed undesirable by China’s ruling Communist Party regime, such as information about political opponents, free speech, democracy, human rights, and peaceful protest. The censored search will “blacklist sensitive queries” so that “no results will be shown” at all when people enter certain words or phrases, according to internal Google documents.

Google previously launched a censored search engine in China in 2006, but pulled the service out of the country in 2010, [citing](#) Chinese government efforts to limit free speech, block websites, and hack Google’s computer systems. The planned relaunch would represent a stunning reversal of that decision.

The company’s censorship project is likely to draw scrutiny from U.S. lawmakers. Sen. Marco Rubio, R-Fla., [tweeted](#) on Wednesday that he wanted to “learn more” about Google’s plans, which he said appeared “very disturbing.”

Human rights groups responded to the revelations with a chorus of condemnation. Amnesty International issued [a statement](#) calling on the internet giant to abandon the plan. “It is impossible to see how such a move is compatible with Google’s ‘do the right thing’ motto, and we are calling on the company to change course,” said Amnesty’s Patrick Poon.

The New York- and Hong Kong-based group Human Rights in China said in a [statement](#) that Google had shown willingness to “trade principles and values for access to the Chinese market.” The group added: “If Google wants to be a credible global technology leader and demonstrate its commitment to core values and responsible corporate citizenship, it has to do better than kneeling before an authoritarian party-state. In the long run, Google will lose more than its own principled employees who refuse to be complicit.”

Maya Wang, China researcher at Human Rights Watch, said Google’s plans risked abetting Chinese government abuses. “That Google appears to be developing this censored version of a search engine in the midst of a harsh, nationwide crackdown on human rights in China — with the consultation of senior Chinese government officials — is alarming,” said Wang.

“Thank goodness somebody in Google leaked this information.”

Google insiders say that the app has already been demonstrated to the Chinese government. As of last month, its launch was pending approval from officials in Beijing, and slated for potential release in six to nine months. It is unclear whether the leaks “and the public outrage that has followed” will affect the plans. The Chinese government is unlikely to be pleased about the disclosures. State media in the country [reportedly denied](#) that Google would be launching the censored search. Either that’s a bold-faced lie, or it means that, in the wake of the revelations and controversy, Communist Party officials have decided they will block approval of Dragonfly.

Some analysts have drawn comparisons between the censorship project and Project Maven, a Google initiative to develop artificial intelligence for U.S. military drones. Project Maven sparked an [internal revolt](#) within the company, which led to Google canceling the contract. One of Google's informal corporate principles is "don't be evil" — a standard some of the company's employees felt Project Maven violated.

Charlie Smith, co-founder of [GreatFire.org](#), an organization that monitors Chinese government internet censorship, said he hoped Google employees would refuse to help develop the censored search app.

"Thank goodness somebody in Google leaked this information — that person is a true hero!" Smith told The Intercept. "Hopefully the outrage from Google employees will be enough to convince Google execs that they should not return to China, at least not like this."

If Google engineers really speak out about this, Smith added, "it would be hard for the company to move forward with the plan. They are really the key here. They must stand up for what is right. Can they really tell themselves that they do no evil?"

GOOGLE USES EVERY TRICK IN THE BOOK TO BIAS ELECTIONS

“There is no other description for this than the muzzling of political speech,” the Trump campaign wrote in a [joint](#) statement with the Republican National Committee, National Republican Senatorial Committee and National Republican Congressional Committee.

They were referring to Google’s Nov. 20 [decision](#) to limit a political campaign’s ability to narrowly target advertisements. The statement added: “Google is clamping down on voter engagement and suppressing voter turnout.”

Google changed its political advertisement policy. The tech company will allow political advertisers to target voters by age, gender and ZIP code “but they can no longer home in on voter affiliation or use information based on public voter records,” Google [announced](#) in a statement.

The press statement also noted that the Trump campaign would not be the only campaign impacted. Democrats and Republicans, as well as political groups, would likely feel the effect, according to the president’s team.

Past media reports show environmental groups are worried such policies could hurt their ability to push back against Trump’s climate policies.

Sen. Elizabeth Warren and other activists railed against Twitter in October after the company [announced](#) plans to stop hosting political advertising by Nov. 22. Twitter CEO Jack Dorsey tweeted about the change and said it applies to candidate ads and issue ads as well.

Warren [thrashed](#) the decision after a [report](#) suggested climate activists were unable to spread policy messages on the platform. The Massachusetts Democrat linked to a [report](#) from Heated, a newsletter devoted to discussing climate issues. The report suggested Twitter is allowing ExxonMobil to run ads [defending](#) itself from a volley of climate lawsuits.

GOOGLE VS. BORDER SECURITY

How Google employees colluded to undermine Trump's executive orders.

[Michael Cutler](#)

[24](#)

On September 21, 2018 Newsweek published a [disturbing article](#) that contained infuriating revelations titled *Google Brainstormed Ways To Combat Trump's Travel Ban By Leveraging Search Results For Pro-Immigration Causes*.

The Newsweek report stated that Google and their hi-tech colluders took legal action to block the Trump administration from enforcing standing immigration law.

Google, along with Apple, Facebook and other technology companies, filed a joint amicus brief challenging the travel ban, stating that it "inflicts significant harm on American business, innovation and growth."

It is clear that to the employees and the executives of Google (and other hi-tech companies), America's borders and immigration laws are impediments to their wealth and to the goals of their companies, rather than what they truly are, our first and last line of defense.

This set the stage for Google's efforts days after the Trump administration first issued an executive order on immigration in January 2017, which would temporarily prevent the entry of citizens of seven countries from entering the United States, not because of their religion but because they could not be effectively vetted.

The media has repeatedly noted that the countries on the list were "Muslim Majority" countries yet many other "Muslim Majority" countries were not on that list including Indonesia, the most populous "Muslim Majority" country on the planet.

Google is determined to obstruct the Trump administration from enforcing long-standing immigration laws to protect America from international terrorists.

Here is how this Newsweek report began:

Google employees brainstormed ways to mitigate the effects of Donald Trump's travel ban in 2017 by altering search functions to show pro-immigration organizations, new emails showed.

The company's internal email chain, obtained and [reported](#) on by *The Wall Street Journal*, shows employees at the multibillion-dollar technology company discussing how to combat Trump's travel ban against seven Muslim-majority countries, including Iraq, Syria, Iran, Libya, Somalia, Sudan and Yemen.

Google workers talked about how they could alter their search functions to show their users how to contribute to pro-immigration causes. They also discussed how to alter the search engine so that people could easily contact their lawmakers and government agencies to ask questions about the ban, the emails showed.

Employees also suggested ways to "leverage" Google searches so that they could counter "islamophobic" search results from people looking up terms like "Islam," "Muslim" and "Iran."

The article subsequently claimed that the e-mails sent around by Google employees were merely a part of a "brainstorm of ideas."

There is no comfort to be taken Google's statement that "[o]ur processes and policies would not have allowed for any manipulation of search results to promote political ideologies, or

from the supposed assurances that Google had never manipulated or modified its search results to promote a particular political ideology or that no such manipulations or modifications were ever employed during the last presidential campaign or after the election when President Trump issued executive orders on immigration.

If members of Google's management were not in agreement with their subordinates attempts to manipulate or modify search results, why didn't they stop them?

The Newsweek article noted that a Google employee opined how difficult it would be to implement such changes in the search results, but was quoted as saying, "But I think this is the sort of super timely and imperative information that we need, as we know that this country and Google would not exist without immigration."

No one in the Trump administration has suggested stopping immigration, yet the quoted Google employee implies as much.

President Trump was only attempting to make certain that our screening process is equal to the task of preventing the entry of international terrorists. Hardly a radical or unreasonable goal!

I am certain that Google maintains strict control over the people who enter their campuses and other facilities, yet Google management and their employees oppose efforts by the Trump administration to similarly control the entry of aliens into the United States.

We must not lose sight of the fact that, no matter how the media and the immigration anarchists may attempt to spin the purpose to the Trump administration's executive orders, in reality they were issued to protect national security and public safety by enforcing a long-standing provision of the Immigration and Nationality Act.

The administration's actions were, in fact, consistent with the findings, recommendations and warnings of the 9/11 Commission.

The first paragraph of the preface of the official report, [9/11 and Terrorist Travel](#) stated:

It is perhaps obvious to state that terrorists cannot plan and carry out attacks in the United States if they are unable to enter the country. Yet prior to September 11, while there were efforts to enhance border security, no agency of the U.S. government thought of border security as a tool in the counterterrorism arsenal. Indeed, even after 19 hijackers demonstrated the relative ease of obtaining a U.S. visa and gaining admission into the United States, border security still is not considered a cornerstone of national security policy. We believe, for reasons we discuss in the following pages, that it must be made one.

We must start by unraveling the lies and falsehoods about the supposed "Travel Ban" which was never a travel ban at all, but actually an *entry restriction* that was intended to protect the United States from the entry of aliens who could not be screened, thereby preventing our CBP (Customs and Border Protection) inspectors from halting entry of terrorists into the United States.

What was almost never noted in the media was that the official title of those executive orders was, "Protecting the Nation From Foreign Terrorist Entry Into The United States."

That title unambiguously established the purpose of the supposedly "controversial" executive order.

My July 23, 2017 article, [Courting Disaster: Supreme Court Decides Against Homeland Security](#) included two versions of the executive order that the Trump administration issued to act as the proclamation required in the section of law, provided below. The administration made it abundantly clear that the actions were being taken to protect America and to prevent the entry of aliens who may have connections with terrorism.

Furthermore, Trump's blocking the entry of aliens from countries associated with terrorism (and where vetting was problematic) did not emerge by executive fiat the way that Mr. Obama created DACA out of thin air.

In point of irrefutable fact, the authority for the President of the United States to block the entry of aliens is a part of the [Immigration and Nationality Act \(INA\)](#), specifically [8 U.S. Code Â§ 1182\(f\)](#) which states:

Whenever the President finds that the entry of any aliens or of any class of aliens into the United States would be detrimental to the interests of the United States, he may by proclamation, and for such period as he shall deem necessary, suspend the entry of all aliens or any class of aliens as immigrants or nonimmigrants, or impose on the entry of aliens any restrictions he may deem to be appropriate.

An [overview of the INA](#) is provided on the official USCIS website, making clear that the current immigration laws have their foundation in the The McCarran-Walter bill of 1952.

That section of law gives the President of the United States sole authority with wide-ranging discretion to exclude any and all aliens whose presence would be detrimental to the interests of the United States. That standard sets as low a bar as could be imagined.

This was certainly not a Travel Ban but was a form of *entry restriction* that was solidly grounded in law. Incidentally, prior administrations, such as the administration of Jimmy Carter, invoked that very same section of law when the U.S. Embassy at Tehran was seized by Iranian radicals and American officials were taken hostage. In that instance, the aliens were citizens of Iran.

On the other hand, Google, as was [reported by CNN](#) on August 2, 2018, has no problem helping China maintain a strangle-hold on its citizens:

[The Intercept](#) reported Wednesday that Google plans to launch a search app in China that would block sensitive websites and search terms to comply with Chinese government censorship.

Perhaps Google's management was planning to employ censorship strategies in the United States that are not unlike strategies Google is willing to employ to censor the internet in China.

In any event, the Tech Giants have found in the radical leftists of the United States kindred spirits who are determined to undermine national security and to extinguish freedom of speech, and with it, all other freedoms we cherish so dearly.

Philip Hammond will introduce a Digital Services Tax in crackdown on tax-dodging web giants

The new levy was the gem of his keynote speech to the Tories' annual conference

By Tom Newton Dunn, Political Editor

TAX-DODGING tech giants will be forced to stump up more under the Chancellor's 21st-century blueprint to defeat Corbynism.

Philip Hammond delighted Tory conference activists with his surprise vow to introduce a Digital Services Tax.

4 Philip Hammond's crackdown on tech giants has been welcomed

The levy on international profits made from users in Britain by Â–California-based giants such as [Facebook](#) and [Google](#) will recoup hundreds of millions of pounds.

Mr Hammond wants it in place in one to two years if a global agreements on taxing tech firms still Â–cannot be reached. The crowd-pleaser was the gem of his keynote speech to the Toriesâ€™ annual conference in Birmingham.

But he also used it to spell out a vision to harness the unfolding technology revolution to improve angry Britsâ€™ lives. It was Mr Hammondâ€™s rival offer to defeat hard-left Labour leader Jeremy Corbynâ€™s Socialist blueprint.

Mr Hammond told the conference: â€œGlobal internet giants must contribute fairly to funding our public services. The best way to tax international companies is through international agreements.

4

â But the time for talking is coming to an end and the stalling has to stop. If we cannot reach agreement, the UK will go it alone with a Digital Services Tax of its own.â

The Chancellor will push ahead with the move after losing patience with the US.

Despite repeated promises for global action to end the tax dodge, President Trumpâ s administration is still stalling on a solution as it reaps billions from the firms, with so many based on the USâ s West Coast.

Britain is instead now looking at Europe-wide action, as France is also keen for something to be done. The Treasury is also consulting on a second online levy, an Online Sales Tax, to force digital retailers such as Amazon to pay more tax too.

4 The Chancellor was accompanied at the conference by his wife Susan

But sources close to the Chancellor said he is going cold on that as he fears the giants will just pass it straight on to consumers.

The Cabinet has been under heavy pressure to combat Mr Corbyn's polished offer of [Socialist solutions to angry voters](#) woes during a successful Labour conference last week.

Mr Hammond tackled the Labour boss head-on yesterday, by pledging to harness the power of the market economy instead of a discredited ideology that will never solve real-world problems.

He insisted Tories must face up to the anger among many British workers, saying: 'Too many feel they are working for the system, but the system isn't working for them.'

4 Big tech giants such as Google would be forced to pay more tax in the UK under the proposals

“ So our challenge is to ensure 21st-century capitalism delivers for those people. It will be this technological transformation, and how we manage it – not Brexit – that will define the future of our country and our party.”

Mr Hammond added: “ Show them that, crucially, the change that technology is driving will address their concerns, not make them worse.

“ If we look for a moment like the party of “ no change”, then we should not be surprised that some will be tempted by the dangerous populism of our opponents.”

Mr Hammond also answered the calls of big business who have been stung by PM Theresa May’s attack on excess profits and boardroom culture. [Tory donor and City billionaire Michael Spencer](#) said the party had “ lost its way” on business, accusing the PM of “ letting herself down” .

But the Chancellor said: "Let me say it, loud and clear: the Conservative Party is, and always will be, the party of business. That means we listen to business." And in a change of tone on Brexit, a more positive Mr Hammond also predicted a "deal dividend" that could fund tax cuts and public service spending once a deal is reached.

He also said the Treasury was keeping sufficient "fiscal firepower" to hand to deal with any economic fallout from a No-Deal Brexit.

BRITAIN still lacks the confidence to intervene in foreign wars due to the disasters of Iraq and Afghanistan, [Defence Secretary Gavin Williamson](#) has said.

GOOGLE'S COVERT DDOS ATTACKS AGAINST CONSERVATIVE WEB SERVERS

CENSORING THE NEWS WITH DOMESTIC DNC-DDOS ATTACKS

If certain news stories, or exposes', hit the digital news stands, the publishers of those online newspapers are often suddenly taken off-line by hundreds of thousands of electronic signal attacks on their web servers, by someone who doesn't like those news stories. These signals are called "Denial of Service" attacks. The hackers call them "Low Earth Orbit Ion Cannon" attacks. They block anybody from getting to the publishers content. While China's "Great Wall" electronic attack flood-gate is well known, the attacks are not coming from China. They are coming from Virginia, Texas, Kansas and locations within the U.S. They are coordinated. T

hey are sophisticated and they are a 100% violation of the First Amendment warrant of free speech. The stories are generally nothing an outside government would be particularly unhappy about. IT experts have now analyzed the source locations of these attacks and their targets and they appear to be almost exclusively directed at things the DNC wouldn't like made public. So, who exactly could be doing this? Who are the suspects:

1. Sid Blumenthal, or his alter-ego Berman, who do contracted "hit jobs" of journalists they are paid to shut-down.
2. The Obama White House Press office.
3. The DNC Press office
4. Silicon Valley billionaires who are the main source of DNC funds
5. The GOP to make it look like the DNC is violating free speech
6. Putin, just because: Putin

7. Some mysterious group DNC contractor

Deputy editor for Industry; eyes on the skies

WE KNOW HOW EACH POLITICIAN IS BRIBED!

WE KNOW WHO BRIBES EACH POLITICIAN!

WE KNOW WHICH INTERMEDIARIES THE BRIBES ARE PAID THROUGH!

THIS IS HOW THEIR BRIBES WORK:

But political influence from outside groups, for example via Google's massive army of lobbyists and crooked law firms, is far more than just cold hard cash in the form of direct campaign contributions. A large portion of the people who run political election programs, ie: "Campaign Managers" are no more than mobsters who run various financial shake-down and transparency evasion efforts.

[The Washington Post reports on many bribery matters](#), for example, that the Palo Alto Mafia of High Tech billionaires has donated less than \$4 million publicly visible dollars to members of Congress in the last 18 years.... BUT.. In an era where some Senate races cost nearly \$100 million, \$4 million seems like very little.

Here are other ways the Palo Alto Mafia of High Tech billionaires bribe their way into policy and politics:

BRIBE: The Palo Alto Mafia of High Tech billionaires also give to party committees and the national party. A maxed-out donation to the national party quickly increases campaign spending to more than \$100,000. Any organization or person can also give \$33,400 to a party committee. Finally, state and local parties can each receive a \$10,000, quickly allowing campaign finance totals to soar to nearly half-a-million dollars.

BRIBE: While the organization has to follow campaign limits, its members can make their own political donations, also following campaign finance limits noted above. But with millions of members, political clout builds quickly. The Palo Alto Mafia of High Tech billionaires have people like Steve Spinner and Steve Westly who use computerized manipulation systems to get members to over donate.

BRIBE: The Palo Alto Mafia of High Tech billionaires has a politically active membership on the social networks they own. With more than five million members, the Facebook and Google constantly communicates with its members about immigration and climate issues that affect the Palo Alto Mafia of High Tech billionaires stock market holdings and advising them how to vote. The organization is also constantly increasing its voter rolls by registering people to vote.

BRIBE: The Palo Alto Mafia of High Tech billionaires also activates its membership when elected officials are facing climate-related legislation, resulting in phone calls and emails and letters to Congress. In addition, lawmakers' votes are noted and advertised to their issue-oriented membership.

BRIBE: The Palo Alto Mafia of High Tech billionaires has its a massive number of their own super PAC's and 501c4 political organization which can run hundreds of their own political campaigns. The groups combined spent more than \$40 million in the midterm elections on Senate and Congressional candidates, according to the Center for Responsive Politics. A lot of that money was spent on political advertising on television, radio and digital, and on direct mail.

BRIBE: The Palo Alto Mafia of High Tech billionaires tip off Senator's staff as to which stocks to have their Goldman Sachs brokers buy and which laws to manipulate that will pump those stocks that the families of Sen. Reid, Harris, Pelosi, Feinstein, etc. have already insider traded. Why do you think Nancy Pelosi and Dianne Feinstein have \$100M in their bank accounts from only a \$170K per year salary? (ie: If Tesla Motors went bankrupt would Nancy Pelosi and Dianne Feinstein, who own covert stock in Musk's companies, go bankrupt?)

BRIBE: Political attackers spend over \$30M, part of that using taxpayer resources, attacking each victim that exposes them. This is proven in the financial transaction records from hired attackers: [Google](#), [Gawker](#), [Deadspin](#), [Gizmodo](#), [Jalopnik](#), Think Progress, Media Matters, Facebook shadow-banning, troll farms, Media Matters, Black Cube, Fusion GPS, et al. (All of whom are now being forced out of business by federal and public investigations). Jury and FBI-compliant evidence proves the assertions. Hiring services, that wipe out a Senator's adversaries, is an overt form of bribery and Dark Money financing by Oligarchs.

BRIBE: There are hundreds of other such examples. We witnessed these crimes, frauds and political money laundering actions but the FEC, FBI, DOJ, FTC and others refuse to arrest the suspects because the suspects share business ventures with regulators and law enforcement executives!!!

Certain California State officials, Obama White House Staff and Federal Agency staff accepted bribes from Silicon Valley Oligarchs and Investment Bank Cartels. They were bribed with: Billions of dollars of Google, Twitter, Facebook, Tesla, Netflix and Sony Pictures stock and stock warrants which is never reported to the FEC; Billions of dollars of Google, Twitter, Facebook, Tesla, Netflix and Sony Pictures search engine rigging and shadow-banning which is never reported to the FEC; Free rent; Rare-Earth mining rights; Male and female prostitutes; Cars; Dinners; Party Financing; Sports Event Tickets; Political campaign printing and mailing services "Donations"; Secret PAC Financing; Jobs in Corporations in Silicon Valley For The Family Members of Those Who Take Bribes And Those Who Take Bribes; "Consulting" contracts from McKinsey as fronted pay-off gigs; Overpriced "Speaking Engagements" which are really just pay-offs conduited for donors; Gallery art; Private jet rides and the use of Government fuel depots (ie: Google handed out NASA jet fuel to staff); Recreational drugs; Real Estate; Fake mortgages; The use of Cayman, Boca Des Tores, Swiss and related money-laundering accounts; The use of HSBC, Wells Fargo, Goldman Sachs and Deutsche Bank money laundering accounts and covert stock accounts; Free spam and bulk mailing services owned by Silicon Valley corporations; Use of high tech law firms such as Perkins Coie, Wilson Sonsini, MoFo, Covington & Burling, etc. to conduit bribes to officials; and other means now documented by us, The FBI, the FTC, The SEC, The FEC and journalists.

Senior White House staffer Steve Rattner was indicted for stock market securities fraud, Former President's campaign manager and Uber executive David Plouffe has been fined \$90,000 for illegally bribing Chicago mayor Rahm Emanuel (Obama's former Chief of Staff, on behalf of the ride-hailing company, the Chicago Tribune reports.

In another case, White House buddies Marty Nesbitt and Harreld Kirkpatrick III formed a private equity investment firm called Vistria created to interface to the 2012 election.

A curious pattern began to emerge. The White House administration would attack industries with government power, which led to substantially lower valuations for these companies. Nesbitt and Vistria, or others close to the White House, could then acquire those assets for pennies on the dollar. For example: The for-profit higher education schools like University of Phoenix, ITT Technical Institute, and DeVry University; In 2013, White House staff blamed the schools for taking advantage of students by saddling them with student debt, ruining their credit and making a profit on it. The White House ordered the Federal Trade Commission to go after them. In the case of the University of Phoenix, its parent Apollo Education Group was suspended after a Federal Trade Commission investigation in 2015. The following year, three companies, including Vistria, swooped in to buy what remained of Apollo at a price 90% below its share price before the investigation. As Vistria's education investment portfolio bulged, a number of White House Education Department officials, including Secretary of Education Arne Duncan, ended up taking high-level jobs with Vistria.

In another instance both the Vice President and Secretary of State were deeply [involved in trade and security](#)

[talks with China](#) even as that country began its aggressive campaign to expand its military and physical presence in the South China Sea. Contrary to standard diplomatic practice, however, both played "good cop," not seriously confronting China on its misbehavior. These two officials were close friends from their years spent together in the Senate. Their families went into business together in 2009. They created a number of equity and real estate investment firms allied to Rosemont Capital, the alternative investment fund of the Heinz Family Office. Over the next seven years, as the Vice President and Secretary of State negotiated sensitive and high-stakes deals with foreign governments, Rosemont entities secured a series of exclusive deals with those same foreign governments. In December of 2013, for instance, when one of those politicians traveled to China for talks. He brought his family along. While there, the father soft-pedaled China's clear aggression, and played up the bilateral trade partnership. Ten days after the trip concluded, China's central bank, the Bank of China, set up a \$1 billion investment joint venture called Bohai Harvest RST. For the record, the "RS" referred to Biden's son's firm, Rosemont Seneca.

That's [questionable enough](#); But months later, in July 2014, the Secretary of State traveled to China, also for talks. He talked little of China's clear aggression, but did conspicuously note that "China and the United States represent the greatest economic alliance trading partnership in the history of humankind." He should know. In the ensuing months, Chinese government-linked firms took major stakes in several of the firms owned or controlled by their family, and provided them with massive funding totaling billions of dollars. Nor is [this the only scandal](#) involving these guys.

While we can provide hundreds of thousands of such examples, it is up to YOU, as a citizen, to call these public figures (who are your EMPLOYEES) to task when it occurs and remove them from office in special elections, mid-term.

This is a chart of the essence of the criminal cycle of corruption engaged by Silicon Valley oligarchs and the Senators and public officials they own:

Google's Larry Page Proves, Yet Again, That He Is All BS And No Substance As His Election Rigging And Flying Cars Crash

- Page is Elon Musk's bromance boyfriend and they rig elections, campaign finance, stock markets and sex parties together
- His billionaire balloon ride project in NASA's Silicon Valley blimp hanger is a disaster
- Larry Page helps run a Silicon Valley organized tech crime empire: <http://dig-innovations.net> and <https://vcracket.weebly.com> and <https://www.thecreepyline.com> and <http://nationalnewsnetwork.net> and <http://londonworldwide.com>
- Page steals his ideas from small inventors and then finances U.S. Patent Office blockades against those inventors per <http://invent111.com>
- Page sneaks around at tech events to steal ideas: <https://www.nytimes.com/2016/01/24/technology/larry-page-google-founder-is-still-innovator-in-chief.html>

Deputy editor for Industry; eyes on the skies

In 2017, success seemed to be just around the corner for Kitty Hawk, the secretive flying car company that's bankrolled by Google co-founder Larry Page and run by Sebastian Thrun, the Stanford AI and robotics whiz who had launched Google's self-driving car unit. Kitty Hawk had just shown off a prototype of the Flyer, a single-seat, battery-powered aircraft intended to be a low-altitude fun machine for use over water, like a jet ski on rotors, with handling that would make flying as easy as driving. "I'm excited that one day very soon I'll be able to climb onto my Kitty Hawk Flyer for a quick and easy personal flight," [Page said](#) at the time. The startup promised to put Flyer in eager buyers' hands by the end of the year.

Late that year the Mountain View, California-based company also began flight-testing a more ambitious project in New Zealand: a two-seat electric self-flying taxi called Cora that Kitty Hawk says will enable city dwellers to soar over gridlocked streets. "Just imagine travelling at 80 miles an hour in a straight line at any time of day without ever having to stop," Thrun [told the Guardian](#) a few months after Cora was unveiled. "It would be transformational to almost every person I know."

Two years later, however, Kitty Hawk's promise to bring personal flying to the masses has failed to take wing yet amid technical problems and safety issues with Flyer and unresolved questions about its practical use, according to four former Kitty Hawk employees who were among six who spoke to *Forbes* on the condition of anonymity due to non-disclosure agreements. At the same time, it may have given up control of Cora, sources suggest.

Kitty Hawk confirmed to *Forbes* that, after unveiling a more polished version of the Flyer last year, it has decided not to sell the one-seater to individuals and has returned deposits to would-be buyers. Behind closed doors, Flyer encountered problems, including frequent breakdowns and fires involving batteries, electric motors and wiring, two former engineers said. Last year, the Mountain View Fire Department was called to put out an early morning blaze at the Flyer building, city records show; former employees said the fire at the Google-owned building involved damaged batteries that had been pulled out of a Flyer that had crashed the previous day in flight testing under remote operation.

"No person has ever been harmed or exposed due to undue risk in over 26,000 test flights with over 100 prototype vehicles," wrote Shernaz Daver, an advisor to Kitty Hawk, in an email response to a list of questions sent by *Forbes*. She did not comment directly on the fires or reports of breakdowns or problems with its batteries.

Intent on bringing Flyer to market quickly, management in several instances brushed off workers who expressed worries that problems with the aircraft could endanger passengers, two former employees say. At least two members of the flight test team were let go after questioning the safety of the aircraft, they say, and some other members of the Flyer team who spoke up quit or jumped to another program at Kitty Hawk. Those individuals declined to comment when reached by *Forbes*.

"It was a pattern—if you talked about safety you were done, so you just didn't," said one former employee. "That's just how it had to be if you wanted to keep getting a paycheck."

Daver did not directly comment on reports of employee departures, but said employees at Kitty Hawk are required to report safety-related issues to their managers, or through a confidential digital channel directly to

the general counsel and human resources, and can anonymously discuss safety concerns with an external safety director.

Kitty Hawk got off to an earlier start than many of the scores of startups now attempting to build electric urban air taxis, and the deep pockets of Page, who has a nearly \$60 billion fortune, have been a huge advantage, enabling the company to hire hundreds of engineers, machinists and designers to create cutting-edge aircraft. However, the company faces the same problems as any aspirant in the field: the poor energy density of the current generation of batteries severely limits the flight times and carrying capacity of electric aircraft, and building a functioning prototype is faster and easier than turning it into a reliable product that satisfies aviation regulators's safety requirements. In the case of urban air mobility, many of the requirements don't yet exist.

These challenges may explain why a strategic partnership with Boeing announced in June could go much deeper than publicly announced. Public filings and organizational shifts at Kitty Hawk described by former employees indicate that there's been a change of control of the Cora program, and Boeing seems the likely acquirer. The jetmaker and Kitty Hawk declined to comment.

That would leave Kitty Hawk with two other aircraft: Flyer and [Heaviside](#), an autonomous winged one-seater unveiled in October that, in an attempt to solve the noise problem that has made heliports unwelcome neighbors, was designed to be 100 times quieter than helicopters, as well as faster. The company has shelved the idea of marketing Flyer aircraft as a recreational device and is exploring commercial options, perhaps running it as a kind of aerial ferry.

“We have moved to seeing it as a transportation service and not as a vehicle for individual purchase,” said Daver. “It is going to be a ride sharing model for transportation services.”

Larry Page began dabbling in aviation in 2010, quietly funding a company called Zee.Aero led by a Stanford aerospace professor, Ilan Kroo, near the Google campus. The original vision was to produce a literal flying car, with folding wings so it could fit inside a home garage, but that was quickly abandoned as impractical, and Zee went on to try other designs, including one registered with FAA under the name Mutt because of its marriage of new elements with an older configuration. It tested a piloted electric aircraft that the company considered selling as a kit to be assembled by buyers. Eventually Zee decided the plane should be developed into a pilotless air taxi, now dubbed Cora.

In 2015 Page set up another stealth startup next door to Zee.Aero and called it Kitty Hawk after the tiny coastal village in North Carolina's Outer Banks where the Wright brothers tested their own flying experiments. The modern-day Kitty Hawk was run by Thrun, who previously directed Google's moonshot R&D program and founded online education company Udacity. It tinkered with a series of concepts, including a complicated scheme to suspend a pod from aircraft by tethers that could pick up a person or cargo on the ground while the aircraft circled overhead.

Eventually Kitty Hawk, which went on to absorb Zee.Aero, embarked on a mission to be the first to get an electric passenger aircraft to market that could take off and land vertically. Thrun wanted a small team to work fast and creatively, using as many off-the-shelf components as possible, according to former employees. “The term thrown around was we were the cowboys of Kitty Hawk, we were doing crazy stuff,” says one.

Kitty Hawk's Flyer, as the project came to be called, was intended to be small enough to avoid safety certification altogether, weighing in under 254 pounds so it could qualify under Federal Aviation Administration rules as an ultralight, a category of aircraft that's long been the province of hobbyists and tinkerers. Operation of ultralights is restricted—they can't be flown over populated areas or at night—but ensuring the aircraft is safe is left up to the maker.

With an engineering team fewer than 20, Flyer made rapid progress. Kitty Hawk offered a rare peek behind the curtain to the [New York Times](#) in 2017, showing off what appeared to be a motorcycle on a spiderweb with eight downward-facing rotors.

Then in 2018 it started giving a small number of [media test rides](#) at Lake Las Vegas of a more finished vehicle with a composite frame with a constellation of 10 upward-facing rotors around it.

Though Flyer was capped to 10 feet in altitude and 20 mph in speed, and said it was intended to be flown over water, for safety, the company was presenting it as a thrill ride, [putting up web pages to take applications](#) for the first production models from individuals and potential fleet operators like amusement parks or resorts. The YouTube personality Casey Neistat gave it a try, publishing [a video](#) that was watched 2.2 million times in which he shouts happily while banking and spinning Flyer around the lake.

But Flyer wasn't ready to thrill: the latest prototype was breaking down frequently and needed regular troubleshooting and repair by engineers, three former employees say. "This thing would break every few hours and need service," said one. Kitty Hawk did not respond to questions about Flyer's reliability.

Among the failures were a series of fires during its development. To save on weight, two former employees say that engineers dispensed with the protective shielding commonly used between lithium-ion battery cells in cars, bundling cells together with tape, increasing the risk that if one ignited, others would catch on fire, too. Only recently did the Flyer program get its own battery expert on staff, one former employee says.

Over the last six months, the Flyer program has gone through a reset, former employees say. The focus has been on improving reliability rather than iterating on the design, and on finding a use for the vehicles.

"Kitty Hawk doesn't start from the principle of what's the economically viable thing we're going to build. It engineers something to solve a problem and then it's 'OK, here's a cool thing we built, what can we do with it?'" said an ex-employee who was among a wave of departures from the Flyer program this year.

The latest idea: that Kitty Hawk would operate Flyer as a service. The company has scouted out cities where it could offer point-to-point rides across bodies of water, which would make for a more forgiving surface to come down on in the event of a crash, two former employees say. And riders will no longer have the freedom to take Flyer for a joyride, they say: the flight path will be automated. Kitty Hawk has [applied for a permit](#) in Jersey City, New Jersey, to develop a floating dock and hangar for a potential route across the Hudson River to Manhattan, and is [exploring a route across San Francisco Bay](#), according to local media.

It's unclear how Flyer would be regulated in such a use, with one grey area being whether it would be treated as a boat traveling above the water or a low-flying aircraft.

Kitty Hawk has reached out to the U.S. Coast Guard to ask how it would classify Flyer, a Coast Guard spokesman said. "We are taking a deliberate look at determining what these vehicles are, as that determination will set precedence for years or decades to come regarding their place in the marine transportation system."

The company's other major program, Cora, also faces daunting regulatory hurdles. Boeing might be the one to see it through.

In June, Boeing and Kitty Hawk announced a strategic partnership that they said would "bring together the innovation of Kitty Hawk's Cora division with Boeing's scale and aerospace expertise." Public records and changes at the company suggest it goes deeper than that.

In May, Kitty Hawk general counsel Molly Abraham made a filing in Delaware to incorporate a company under the name of Cora Aero at the same address as Kitty Hawk; a November filing lists [Cora Aero's CEO as Gary Gysin](#), the former head of Liquid Robotics, a developer of wave-powered autonomous watercraft. His [LinkedIn profile](#) states he's head of a stealth mode startup.

Former Kitty Hawk employees said that around the time the Boeing partnership was announced, access to the Cora building, which had contained a cafeteria and reception area shared by all, was abruptly restricted to workers only on that program, and IT, HR and other back office workers were divided between Cora and Kitty Hawk. Several said they believe Boeing is now in control of Cora.

Hard yards lie ahead for Cora in New Zealand, where Kitty Hawk chose to try to win safety certification due to enticing features of the country's air safety code, which promises to allow the company to collaboratively define airworthiness standards with that country's Civil Aviation Authority. Additionally, a unique provision of the regulations permits adventure flights by aircraft that don't have standard safety certifications, such as vintage warbirds, which could allow Kitty Hawk to launch a revenue-generating passenger service before Cora is fully certified, said James Lawson, an aerospace safety consultant who previously consulted with Kitty Hawk on Cora when the company was considering pursuing certification in the U.S.

Cora is hand-built, largely of custom components made in-house, and still at the stage of proving out its technology, former employees on that program said. Another version needs to be constructed with safety systems, weatherproofing and passenger comforts, and that's designed to be easily manufacturable. Those final, long and painstaking steps promise to be a tall hurdle for many of the urban air mobility startups as they try to transition from Skunk Works-type inventors to real businesses, said Lawson and it could account for the bulk of the spending.

The technology is one thing, but 80% of the effort is in productizing and building an aircraft that can be certified, said Lawson.

GOOGLES ANTI-BREITBART PLOT: Employees Targeted Ad Revenue in 2017

Adrian

Dennis/AFP/Getty 10 Dec 2018 [1905](#)

5:27

Emails leaked exclusively to Breitbart News reveal a group of Google employees, with encouragement from the tech giant's director of monetization, began plotting the downfall of this website shortly after the 2016 election.

The group sought to strike at Breitbart News's revenue by kicking the site off Google's market-dominating ad services. Although their efforts ultimately failed, the discussion featured senior Google employees speaking frankly about their reasons for targeting the site. These included unfounded allegations of "hate speech" and "fake news."

In the leaked emails, Google employee Richard Zippel advised a fellow employee that Google would act against Breitbart News "at the site level" if sufficient examples of "hate" were found. This kicked off a concerted effort to find evidence of "hate speech" on Breitbart.

[Hulu and AT&T to Run Ads When Video is Paused](#)

Another employee, David Richter, then forwarded Zippel's email to his colleagues, urging them to scour Breitbart for examples. Of course, according to the far-left definitions used by Silicon Valley, even the term "illegal alien" can be [categorized](#) as hate speech. According to LinkedIn, Richter is now a technical lead at Google Cloud Storage, where he oversees privacy and security.

The Monetization Director

In the email thread that followed, Google's Director of monetization, Jim Gray, confirmed that his team had been monitoring Breitbart News on a weekly basis "since the origin[al] fake news kick-off discussion."

The comment, made in February 2017, was little over three months since left-wing media kicked off the fake news panic "allegedly over Macedonian bloggers publishing genuinely fake articles for clicks and ad revenue."

Gray's statement confirms that in Silicon Valley, conservative media was a prominent target of the fake news panic from the very beginning. For these Google employees, the chosen method of attack was Breitbart News's ad revenue — which like most websites on the internet, makes use of Google's ad services.

Gray's enthusiasm to deplatform Breitbart News also raises questions over how he managed YouTube, where he also directed monetization according to his LinkedIn profile. His time in that role overlaps with a period of [widespread complaints](#) about the unfair removal of ad revenue from political channels on YouTube.

Instead of challenging the transparently political (the internal discussion group was labeled "resistance") effort to demonetize the web's leading conservative website, Gray instead sought to reassure the group that action was being taken. Using the jargon-rich corporate talk beloved on Silicon Valley, Gray hinted at efforts underway at Google to make it easier to strip ad revenue from inconvenient websites.

The discussion was then joined by Jeff Lakusta, head of technical support for Google's ad buying software. Inviting colleagues to join a collaborative project, Lakusta said it would be a tough sell to prove Breitbart is hate speech only if a thorough approach would result in Google demonetizing the website.

As Breitbart News [previously reported](#), Lakusta would later follow up his efforts by co-authoring an open letter to Google's management, demanding that Breitbart News be demonetized.

Later in the discussion, employees directly involved in the policy area chimed in, including a member of the legal team for AdSense, the Google platform relied upon by many digital publishers for ad revenue.

The employee, Emily Garber then assured Google employees that Breitbart was a very much on our radar.

“There is obviously a moral argument to be made as well as a business case,” chimed in another Googler employee, Ryan Garza.

Garza’s LinkedIn profile reveals that he liaises directly with Google’s large advertising clients to help them solve “policy and technical issues.”

Emily Garber later returned to the discussion thread, where she confirmed that the anti-Breitbart spreadsheet had been passed to Google’s trust and safety team.

The Digital Ad Monopoly

Earlier this year, Breitbart News revealed that a cabal of employees in Google's ad department were directing the company's ad clients to the page of Sleeping Giants, a far-left organization that attempts to deplatform conservative media organizations â including Breitbart News â by spreading slander to their advertisers.

In the same report, Breitbart News revealed that Jeff Lakusta, Pierre Fite-georgel, and Tim Chevalier had authored an open letter to Google's management formally requesting that Breitbart be demonetized. It now appears that the letter was the tail-end of a long process within Google to smear Breitbart as a place for â fake newsâ and â hate speech,â that began mere months after the 2016 election.

Google holds a dominant position in digital ads, accounting for [42.2 percent of the market in 2017](#) â more than double the share of its closest competitor, Facebook.

Being kicked off the service would be a major financial blow for any website â which is no doubt why Google's famously [far-left](#) employees worked so hard to make it happen.

Update â A Google spokeswoman responded to Breitbart News's request for comment with the following statement:

We have extensive and very well publicized policies for publishers who choose to monetize with Google ads. We enforce these policies vigorously, consistently and without any political bias. We regularly and routinely review sites in our ad network to ensure compliance with our policies. These emails from early 2017 simply show the AdSense team explaining that such a periodic review was underway.

Google did not answer Breitbart News's more specific inquiries, including whether the company has any formal internal safeguards against internal bias.

GOOGLE EXPOSED AS POLITICAL SCAM OPERATION

Google internal corporate policy documents exposed which reveal its internal commitment to radical intersectional leftism, according to a major [report](#) by NBC News.

The NBC report, an in-depth feature that drew on comments from current Google employees, pointed to Breitbart News's exposé on the company's internal culture, which is highly biased against white males, as one of the reasons for the tech giant's shift:

The right-wing news website Breitbart began covering the internal tensions about Google's efforts to become more diverse, publishing [a July 2018 article](#) on a speaker event hosted by Google on the topic of how white people can better navigate conversations about racism and privilege in the workplace. Breitbart [accused](#) Google of breaking its [internal policy](#) against using blanket statements about categories of people, such as about employees in certain racial groups.

“There was a meme going around that said white fragility shuts down discussions of white fragility,” a person involved with the event said in an interview, referring to a meme that circulated on an internal employee message board. The event wasn't ultimately shut down, but additional security was provided.

Read the full report at [NBC](#).

Radical intersectional leftism, an ideology often characterized by the use of demeaning language (“white fragility”) against white males, is typically introduced into corporations like Google under the banner of “diversity and inclusion,” whereby discrimination and hostility against certain groups is excused on the basis of creating an “inclusive” culture for women and minorities.

According to the NBC report, fear of further lawsuits similar to James Damore's class-action case against the tech giant, which alleged that it discriminates on the basis of race and gender as well as political viewpoint, was another factor causing the company to scale back its internal “inclusion” efforts.

As Breitbart News reported in 2018, the Damore case [revealed](#) numerous instances of rampant anti-white, anti-male sentiments in Google's workforce in the runup to Damore's firing (Damore was fired after he circulated a memo calling for more viewpoint diversity at the company).

One comment made by a then manager-level employee, Liz Fong-Jones in 2015 released via the lawsuit reads “I could care less about being ‘unfair’ to white men. You already have all the advantages in the world.”

In another 2015 post released via the lawsuit, then manager-level employee Kim Burchett shared an article challenging people to “stop reading white, straight, cis male authors for one year.”

The lawsuit also revealed a [document](#) that was circulated to managers at the company, advising them that values like “objectivity,” “individual achievement,” and “perfectionism” were examples of “U.S. white male dominant culture.”

Melanie Parker, Google's “Chief Diversity Officer,” denied that the company is scaling back its diversity efforts. In a comment to NBC, she said the company is “maturing our programs to make sure we're building our capability.” Parker cited the company's new “racial equity training” course, which was launched recently.

However, NBC cites a source at Google who says that one senior employee in the AI unit told her that “conversations about diversity could become a liability.”

Another Google employee's statements to NBC indicate that some of Google's changes were merely cosmetic, for example referring to diversity and inclusion by the acronym “D&I” instead of saying the

word â diversity.â

Are you an insider at Google, Facebook, Twitter, or any other tech company who wants to confidentially reveal wrongdoing or political bias at your company? Reach out to Allum Bokhari at his secure email address allumbokhari@protonmail.com.

California Corporations, and)

DOES 1 through 50, Inclusive) Date:

)

Defendants) Time:

) Dept.:

FACTS OF THE CASE:

1. Plaintiffs are a â classâ of technology employees, contractors and businesses located in The United States Of America and defined as a legal â CLASSâ for court purposes. Plaintiffs have no specific political party affiliation and are, in fact, bi-partisan by volume. Plaintiffs have reported to the FBI in Washington, DC and In San Francisco, California at 450 Golden Gate Avenue, on the 13th Floor, in person, telephonic-ally and in writing and to the GAO in writing and telephonic-ally and to the White House and U.S. Congress members in person and in writing, among others, since 2006. This matter is under active federal and private investigation.

2. Defendants have offices nationwide and are, at least, known to have offices in California at numerous locations. Defendants attempted to â ***harm, decimate, punish, damage, character assassinate and delay Plaintiffs civil rights as part of Defendants reprisal, retribution, intellectual property theft, anti-trust violating vendetta payback media information-manipulation program, in which Defendants sought to own and control government policy and business markets for personal financial and ideological insider goals.***â Defendants engaged in actions legally qualifying as â *RICO Racketeering-violating criminal conspiracy actions*â in order to defraud the competitors, the public, government officials and others. Defendants are, according to top government officials: â The Command And Controlâ centers for anti-democracy, anti-trust and anti-competitive domestic operations using covert technology manipulations and a constant program of lies, deferrals and delays when questioned by government investigators about their illicit actions. Plaintiffs, and third parties, placed a global internet sensor array around the world an a large number of ISPâ s, for years, which tested and verified that Defendants were manipulating the process of the internet, consciously and manually, in order to cause these harms, damages, attacks and anti-trust violating schemes and practices. It has been proven, by federal and private investigators, that Defendants organized, operated, financed, implemented and covered-up the â hit-jobsâ and attacks that Plaintiff groups have charged them with the operation of. One Plaintiff ran a 6 year study comparing Defendants coverage of Defendants asset: Tesla Motors, Defendants partner and personal live-in friend: Elon Musk with Defendants coverage of all competitors to Musk during the time period and the results show goose-step synchronization to cover-ups, stock valuation hypes and competitor â neggingâ . From the same study, billions of dollars of non-reported FEC-violating campaign financing was uncovered. Defendants pay U.S. Senators to protect and assist them in these illicit actions. Payment forms include insider stock tips, stock assets, revolving door jobs, government contract rights and other quid-pro-quo including tax waivers and, as such, Defendants operate as an organized crime entity in violation of federal RICO and Anti-Trust laws. Defendants executives have been documented, in a huge number of news reports, divorce court records and law enforcement records, being involved in a huge number of sex trafficking scandals, tax evasion scandals, political bribery scandals and other incidents which demonstrate their poor ethical, moral and procedural natures and their inclinations towards criminality.

4. The true names and capacities of the Defendants, DOES 1 through 50, inclusive, are presently unknown to the Plaintiffs at this time and the Plaintiffs sue those Defendants and each of them, by such fictitious names pursuant to the pertinent provisions of the (TBD) Code of Civil Procedure. The facts and veracity of the charges and claims herein are duplicate-evidenced in multi-terabyte hard drives and provided online cloud-based evidence repositories containing millions of pages of validating evidence compiled by Plaintiffs, FBI, GAO, SEC, EU, private, national journalists, Congressional, news industry, forensic specialist and leaked archive investigators.

5. Plaintiffs have had a multi-decade relationship with White House, Congressional, campaign finance, law enforcement and business parties discussed in this matter and had eye-witness knowledge of the crimes and misdeeds of Defendants and their associates and, as such, have received additional evidence from other eye-witness parties and have been provided with verified evidence notification of further validated evidence held by law enforcement agencies which confirm the veracity of Plaintiffs statements. White House and Congressional staff have certified the veracity of the evidence herein. Former employees of Defendants are prepared to testify to the veracity of the facts herein. Multiple other parties have sue and won, or settled, with Defendants for the same issue and Defendants have thus demonstrated a proven history of the charged illicit actions against Plaintiffs and verify the facts that Defendants conspire to harm United States businesses, United States citizens and the operation of the United States Government itself.

6. Plaintiffs were solicited to participate in Defendants crimes and schemes and refused to participate on the grounds that Defendants plans and schemes were illegal illicit and immoral. Because Plaintiffs refused to participate in Defendants crimes, assisted investigators with law enforcement actions and continued Plaintiffs business in competition to Defendants; Defendants took the further illicit actions described herein, against Plaintiffs.

7. The Plaintiffs are informed and believe and, based on that information and belief, allege that the named Defendants herein and each of the parties designated as a "DOE" and every one of them, are legally responsible jointly and severally for the Federal RICO Statute violating events and happenings referred to in the within Complaint for Intentional Interference with Contractual Relations, Intentional Interference with Prospective Economic Advantage, Cyberstalking, Fraud, Invasion of Privacy, Unfair Competition and Theft of Intellectual Property and RICO statute violations. In particular, Defendants took compensation for, and engaged in, malicious and coordinated tactics to seek to destroy, damage, harm and ruin Plaintiffs via an illicit media "hit-job" service which Defendants regularly offered in covert commerce and engaged in regularly against targets that Defendants were hired to seek to ruin as part of reprisal, vendetta, retribution programs operated for business and political competitors of the targets. Historical facts and other history-making lawsuits by third parties, has proven Defendants to be the single largest core violator of human rights, in this manner, in the world. Defendants offer the service of creating and publishing contrived "hatchet job" movies, fake news articles, faked comments and repercussion back-links describing the Plaintiffs in horrific descriptors. The attack material is re-posted, "impression accelerated", "click-farm" amplified by Defendants Chinese and Russian Click-Farms and Streisand array re-posted by Defendants massive character assassination technology via servers algorithms and technical internet manipulation daily as recently as yesterday.

This means that clock on the Statute Of Limitations is re-set every 24 hours because Defendants restart their attacks on the internet every 24 hours. The DOJ, SEC, FTC and FBI have been asked to aggressively assist in this matter.

Defendants also embed their in-house-created attack articles in job hiring databases on Axciom, Palantir, Taleo, USAJobs, Oracle and SAP driven HR systems and other databases used by all hiring and recruiting services in order to prevent Plaintiffs from ever receiving income for W2 or 1099 work ever again. Defendants own staff then post thousands of fake comments, below each attack item, under fake names, designed to make it appear as if a broad consensus of the public agreed with the defamation messages by Defendants. Almost all of the fake comments were created by a handful of Defendants own staff pretending to be a variety of outside voices. Defendants provide the service of delivering "weaponized text and media to corporate and political clients". Defendants replicated various versions of these attack items across all of their different brands and facade front publications and added additional fake comments to each on a regular basis.

Defendants are widely documented in tens of thousands of reports in law enforcement investigations, regulatory investigations, journalistic news reports, university research and other credible documents as having engaged in the felony-level manipulation of elections and public media and did use those same manipulation technologies to attack Plaintiffs, a small set of hundreds of thousands of examples of such verification include:

Understanding Google's Computerized Manipulation Of 'the Streisand Effect'

- How a private-property dispute birthed a web phenomenon that became a Google attack technology that Google/Alphabet/YouTube use to destroy competitors and manipulate Democracy.

In 2003, a [picture](#) of Barbra Streisand's beachfront home hit the web as part of a public collection of images displaying coastal erosion. In response, in February 2003, Streisand sued the photographer for \$50 million for invasion of privacy, claiming violation of a state law aimed at the telephoto lenses of paparazzi.

Ironically, the media [attention](#) surrounding the lawsuit made the photo of her house go viral (at least in 2003 terms). In the month before the lawsuit, the picture had been downloaded only six times, including twice by her lawyers—whereas the image was downloaded more than 420,000 times during the month following the lawsuit. This paradoxical result—where an attempt to silence, suppress, or stop something backfires—was dubbed the *Streisand effect*.

Let's take a closer look at the Streisand effect.

Examples of the Streisand Effect

Here are three different times the Streisand effect was apparently reified by real-world examples.

In 2012, a Scottish schoolgirl named Martha Payne started blogging about her school lunches and included pictures of the meals, which, as could be expected by anyone who has ever been to school, were unappetizing.

Soon, celebrity chef and food activist Jamie Oliver tweeted out his support, and the blog garnered three million hits in two months. Consequently, local government authorities banned Payne from taking photos of the lunches because (they claimed) cafeteria workers were worried about getting fired. Even though the authorities quickly reversed this decision, for them it was too late, and the British national media and the Internet ran with the story.

In 2013, BuzzFeed ran a [list](#) titled "The 33 Fiercest Moments From Beyoncé's Halftime Show." Although the intention of the list was likely laudatory, some of the still photos were considered "unflattering."

Consequently, Queen Bey's publicist contacted BuzzFeed to request that the unflattering photos, which were cited, be switched out. BuzzFeed responded with a follow-up [piece](#) titled "The 'Unflattering' Photos Beyoncé's Publicist Doesn't Want You To See," which included an email from the publicist and the cited shots.

Subsequently, the Internet did its thing, and a meme was born. Countless "unflattering" shots of Beyoncé as a zombie, powerlifter, anime cartoon, and so forth popped up.

In 2014, cab drivers from across Europe went on strike to decry the lack of regulation of the ride-hailing app Uber. Without cabbies on the roads, riders turned to Uber, with downloads of the app increasing more than eight times in London alone.

Deconstructing the Streisand effect

In an [article](#) published in the *International Journal of Education*, Sue Curry Jansen and Brian Martin explained how the Streisand effect is a consequence of failed censorship attempts. These outrage-[management](#) processes include cover-up, defamation of the target, reframing events, false justice, and intimidation or rewards.

The authors also argued that censorship is a process that requires active maintenance to conceal the actions of powerful people. Furthermore, they wrote that a clearer understanding of outrage-management processes "stimulates awareness of tactics for challenging censorship by exposing its existence, validating the censored information, explaining the importance of free expression, not relying on official channels for solutions but instead mobilizing wider awareness and support, and resisting intimidation and rewards."

By the way, you may be wondering how Babs's court case turned out. The chanteuse not only brought viral attention to her bluff-top estate by bringing the suit in the first place but the suit was dismissed in December 2003.

Google, YouTube and Facebook have commercialized "The Streisand Effect" by deploying computerized processes to steer the public towards, or away from, one product, candidate or point-of-view using manually programmed directions.

Former motor racing boss Max Mosley is suing Google for continuing to display photographs he says breach his privacy. But does pressing for information to be kept private, or suppressed, often have the opposite effect?

At first sight not much unites Beyonce and Max Mosley. But they, and several other celebrities and organisations, have become victims of the "Streisand effect".

In 2005, Mike Masnick, founder of the Techdirt website, [coined the term](#). Two years earlier singer Barbra Streisand unsuccessfully sued photographer Kenneth Adelman, who was documenting the coastline of California, for including her cliff-top home in Malibu. The resulting publicity helped drive 420,000 visits in a month to the site where the photo was published. According to documents filed in court, images of Streisand's house had been downloaded only six times before the legal action.

It's not always a fight over privacy. In February last year the BuzzFeed website published a [selection of singer Beyonce's "fiercest moments"](#) - mocking her facial expressions while performing at the Superbowl. Her publicist reportedly contacted it to ask that seven of the most "unflattering" photos be removed. BuzzFeed refused and republished exactly this selection with the headline: ["The 'Unflattering' Photos Beyonce's Publicist Doesn't Want You To See"](#). The exposure of the unflattering photos was magnified.

A few months later it was reported that lawyers for Pippa Middleton, sister of the Duchess of Cambridge, [had asked for the removal of a parody Twitter feed](#), which offered ridiculously obvious lifestyle advice in her name, such as "Avoid getting lost by consulting with a map" and "A party isn't much fun without people attending". Its following increased.

In 2008 the Church of Scientology reportedly tried to get a [video featuring film star Tom Cruise talking about his faith](#), designed for viewing by its followers only, removed from websites after it was leaked. The publicity meant it became shared more widely.

In 2012, Argyll and Bute Council banned nine-year-old Martha Payne from taking pictures of her school meals and posting them, along with dismissive ratings out of 10, on a blog. Her family complained and this was overturned, amid much publicity. To date the blog has had [more than 10 million hits](#) and Martha has raised more than Â£130,000 for charity.

You don't need to be famous to suffer from the Streisand effect. Spaniard Mario Costeja Gonzalez fought a long legal battle for the right to be forgotten. He complained that a search of his name in Google brought up newspaper articles from 16 years ago about a sale of property to recover money he owed. He enjoyed a [landmark victory](#) to establish the right to be forgotten. But it is unlikely he will ever be forgotten. As of this moment, his name conjures up hundreds of thousands of Google search results.

The Streisand effect

- Term first used in 2005 by Mike Masnick, founder of the website Techdirt
- Denotes increased publicity as a result of attempts to remove embarrassing online content
- Followed a failed attempt in 2003 by singer Barbra Streisand to sue a photographer who posted a picture of her seaside home on a website

But Max Mosley is arguably the greatest example. He is suing Google for continuing to display in search results images of him with prostitutes at a sex party, citing alleged breaches of the Data Protection Act and misuse of private information. Every time he makes a legal move in his crusade over privacy, there's a danger it becomes more likely people will seek out the very images he is complaining about.

The 74-year-old former president of Formula One's governing body FIA wants Google to block pictures first published in the now-defunct tabloid News of the World, which he successfully sued in 2008. "As the gateway to the internet Google makes

enormous profits and has great influence, so I have not taken this action lightly," he has said in a statement. His lawyers add that the company should not be allowed "to act as an arbiter of what is lawful and what is not". Google says it has been working with Mosley "to address his concerns".

But is there a risk that Mosley will cause himself more embarrassment by bringing a fairly old, and perhaps half-forgotten, news story back to people's attention? A survey of Twitter shows some users are posting the pictures that he is keen to remove.

"Anyone trying to get something banned is always going to be of more interest than something that people don't seem bothered by," says Jenny Afia, head of talent at the law firm Schillings. "It's a spark for curiosity."

In previous generations there's no doubt it was more straightforward to attempt to suppress information or images. The ease of sharing now almost means that nothing can really be suppressed.

You could argue that the internet makes attempts to guard your privacy risky on a scale proportional to the likelihood of your privacy being meaningfully breached in the first place. If there was a danger that lots of people would circulate a private photo of you doing something embarrassing, it's very likely that trying to suppress it will have the opposite effect. If there was little danger that the photo would have been circulated, an attempt at suppression might not trigger the Streisand effect.

There are endless mischief-makers who would dedicate themselves to propagating information that someone wanted hidden, just for the very fact of the attempt to hide it.

Mosley is a wealthy man used to publicity. Yet suing could mean a stressful, drawn-out court case, covered in detail by the media.

"It's a horrible dilemma for people who are faced with horrible or untrue stories," says Afia. "That's where Max Mosley is very brave to keep fighting. Many people decide to let it go."

For the likes of Mosley and Costeja Gonzalez, the principle surely supersedes the actual effect of legal action. They effectively end up fighting for the right of others to more easily safeguard their privacy. Even at the de facto cost of their own.

And there's a clear difference between those fighting for a right to privacy and those, like Beyonce's representatives, who are merely trying to manage a reputation or public image. There the Streisand effect is potent. If your reaction to mockery is to try and squash it, there will be lots more mockery.

Google internal corporate policy documents exposed which reveal its internal commitment to radical intersectional political and ideology control, according to a major [report](#) by NBC News.

The NBC report, an in-depth feature that drew on comments from current Google employees, which is highly biased against white males, as one of the reasons for the tech giant's shift:

The right-wing news website Breitbart began covering the internal tensions about Google's efforts to become more diverse, publishing [a July 2018 article](#) on a speaker event hosted by Google on the topic of how white people can better navigate conversations about racism and privilege in the workplace. Breitbart [accused](#) Google of breaking its [internal policy](#) against using blanket statements about categories of people, such as about employees in certain racial groups.

â There was a meme going around that said white fragility shuts down discussions of white fragility,â a person involved with the event said in an interview, referring to a meme that circulated on an internal employee message board. The event wasn't ultimately shut down, but additional security was provided.

Read the full report at [NBC](#).

Radical intersectional ideology often characterized by the use of demeaning language (âwhite fragilityâ) against white males, is typically introduced into corporations like Google under the banner of âdiversity and inclusion,â whereby discrimination and hostility against certain groups is excused on the basis of creating an âinclusiveâ culture for women and minorities.

According to the NBC report, fear of further lawsuits similar to James Damoreâs class-action case against the tech giant, which alleged that it discriminates on the basis of race and gender as well as political viewpoint, was another factor causing the company to scale back its internal âinclusionâ efforts.

As Breitbart News reported in 2018, the Damore case [revealed](#) numerous instances of rampant anti-white, anti-male sentiments in Googleâs workforce in the runup to Damoreâs firing (Damore was fired after he circulated a memo calling for more viewpoint diversity at the company).

One comment made by a then manager-level employee, Liz Fong-Jones in 2015 released via the lawsuit reads âI could care less about being âunfairâ to white men. You already have all the advantages in the world.â

In another 2015 post released via the lawsuit, then manager-level employee Kim Burchett shared an article challenging people to âstop reading white, straight, cis male authors for one year.â

The lawsuit also revealed a [document](#) that was circulated to managers at the company, advising them that values like âobjectivity,â âindividual achievement,â and âperfectionismâ were examples of âU.S. white male dominant culture.â

Melanie Parker, Googleâs âChief Diversity Officer,â denied that the company is scaling back its diversity efforts. In a comment to NBC, she said the company is âmaturing our programs to make sure weâre building our capability.â Parker cited the companyâs new âracial equity trainingâ course, which was launched recently.

However, NBC cites a source at Google who says that one senior employee in the AI unit told her that âconversations about diversity could become a liability.â

Another Google employeeâs statements to NBC indicate that some of Googleâs changes were merely cosmetic, for example referring to diversity and inclusion by the acronym âD&Iâ instead of saying the word âdiversity.â Clearly, Google will say or do anything to promote their cult-like indoctrinations.

Google's and Facebook's servers are built and programmed to manipulate the The Streisand Effect for commercial goals. Should Congress allow that? More evidence includes:

Validating the fact that Google/YouTube, Et Al use psychological Warfare Tools on the public and stock marketed

Distinguished research psychologist Robert Epstein explains one highly referenced study and reviews the validated evidence that Google's search suggestions are manually biased in favor of political candidates and stock market holdings that have crony kick-back deals to Google. He estimates that biased search suggestions might be able to shift as many as 3 million votes in any presidential election in the US or destroy a competitor, reporter that Google does not like or run the ultimate character assassination.

  Biased search rankings can swing votes and alter opinions, and a new study shows that Google's autocomplete can too.

A [scientific study](#) I published last year showed that search rankings favoring one candidate can quickly convince undecided voters to vote for that candidate â as many as 80 percent of voters in some demographic groups. My latest research shows that a search engine could also shift votes and change opinions with another powerful tool: autocomplete.

Because of [recent claims](#) that Google has been deliberately tinkering with search suggestions to make Hillary Clinton look good, this is probably a good time both to examine those claims and to look at my new research. As you will see, there is some cause for concern here.

In June of this year, Sourcefed released a video claiming that Google's search suggestions â often called "autocomplete" suggestions â were biased in favor of Mrs. Clinton. The video quickly went viral: the full [7-minute version](#) has now been viewed more than a million times on YouTube, and an abridged [3-minute version](#) has been viewed more than 25 million times on Facebook.

The video's narrator, Matt Lieberman, showed screen print after screen print that appeared to demonstrate that searching for just about anything related to Mrs. Clinton generated positive suggestions only. This occurred even though Bing and Yahoo searches produced both positive and negative suggestions and even though Google Trends data showed that searches on Google that characterize Mrs. Clinton negatively are quite common â far more common in some cases than the search terms Google was suggesting. Lieberman also showed that autocomplete did offer negative suggestions for Bernie Sanders and Donald Trump.

"The intention is clear," said Lieberman. "Google is burying potential searches for terms that could have hurt Hillary Clinton in the primary elections over the past several months by manipulating recommendations on their site."

[Google responded](#) to the Sourcefed video in an email to the Washington Times, denying everything. According to the company's spokesperson, "Google Autocomplete does not favor any candidate or cause." The company explained away the apparently damning findings by saying that "Our Autocomplete algorithm will not show a predicted query that is offensive or disparaging when displayed in conjunction with a person's name."

Since then, my associates and I at the American Institute for Behavioral Research and Technology (AIBRT) â a nonprofit, nonpartisan organization based in the San Diego area â have been systematically investigating Lieberman's claims. What we have learned has generally supported those claims, but we have also learned something new â something quite disturbing â about the power of Google's search suggestions to alter what people search for.

Lieberman insisted that Google's search suggestions were biased, but he never explained why Google would introduce such bias. Our new research suggests why â and also why Google's lists of search suggestions are typically much shorter than the lists Bing and Yahoo show us.

Our investigation is ongoing, but here is what we have learned so far:

[Can Google Tip the Scales on the US Presidential Election Without Anyone Knowing?](#)

To test Lieberman's claim that Google's search suggestions are biased in Mrs. Clinton's favor, my associates and I have been looking at the suggestions Google shows us in response to hundreds of different election-related search terms. To minimize the possibility that those suggestions were customized for us as individuals (based on the massive personal profiles Google has assembled for virtually all Americans), we have conducted our searches through proxy servers â even through the Tor network â thus making it difficult for Google to identify us. We also cleared the fingerprints Google leaves on computers (cache and cookies) fairly obsessively.

Google says its search bar is programmed to avoid suggesting searches that portray people in a negative light. As far as we can tell, this claim is false.

Generally speaking, we are finding that Lieberman was right: It is somewhat difficult to get the Google search bar to suggest negative searches related to Mrs. Clinton or to make any Clinton-related suggestions when one types a negative search term. Bing and Yahoo, on the other hand, often show a number of negative suggestions in response to the same search terms. Bing and Yahoo seem to be showing us what people are actually searching for; Google is showing us something else â but what, and for what purpose?

As for Google Trends, as Lieberman reported, Google indeed withholds negative search terms for Mrs. Clinton even when such terms show high popularity in Trends. We have also found that Google often suggests positive search terms for Mrs. Clinton even when such terms are nearly invisible in Trends. The widely held belief, reinforced by Google's own [documentation](#), that Google's search suggestions are based on "what other people are searching for" seems to be untrue in many instances.

Google's Explanation

Google tries to explain away such findings by saying its search bar is programmed to avoid suggesting searches that portray people in a negative light. As far as we can tell, this claim is false; Google suppresses negative suggestions selectively, not across the board. It is easy to get autocomplete to suggest negative searches related to prominent people, one of whom happens to be Mrs. Clinton's opponent.

A picture is often worth a thousand words, so let's look at a few examples that appear both to support Lieberman's perspective and refute Google's. After that, we'll examine some counterexamples.

[Assange: Clinton's Campaign is Full of 'Disturbing' Anti-Russia 'Hysteria'](#)

Before we start, I need to point out a problem: If you try to replicate the searches I will show you, you will likely get different results. I don't think that invalidates our work, but you will have to decide for yourself. Your results might be different because search activity changes over time, and that, in turn, affects search suggestions. There is also the "personalization problem." If you are like the vast majority of people, you freely allow Google to [track you](#) 24 hours a day. As a result, Google knows who you are when you are typing something in its search bar, and it sends you customized results.

For both of these reasons, you might doubt the validity of the conclusions I will draw in this essay. That is up to you. All I can say in my defense is that I have worked with eight other people in recent months to try to conduct a fair and balanced investigation, and, as I said, we have taken several precautions to try to get generic, non-customized search suggestions rather than the customized kind. Our investigation is also ongoing, and I encourage you to conduct your own, as well.

Let's start with a very simple search. The image below shows a search for "Hillary Clinton is " (notice the space after is) conducted on August 3rd on Bing, Yahoo, and Google. As you can see, both Bing and Yahoo displayed multiple negative suggestions such as "Hillary Clinton is a liar" and "Hillary Clinton is a criminal," but Google is showed only two suggestions, both of which were almost absurdly positive: "Hillary Clinton is winning" and "Hillary Clinton is awesome."

â Hillary Clinton is â

To find out what people actually searched for, let's turn to Google Trends â Google's tabulation of the popularity of search results. Below you will see a comparison between the popularity of searching for "Hillary Clinton is a liar" and the popularity of searching for "Hillary Clinton is awesome." This image was also generated on August 3rd. "Hillary Clinton is a liar" was by far the more popular search term; hardly anyone conducted a search using the phrase, "Hillary Clinton is awesome."

(Contact our office for screen shot, DNS report and server log print-outs)

â Hillary Clinton is awesome.â

Okay, but Google admits that it censors negative search results; presumably, that is why we only saw positive results for Mrs. Clinton â even a result that virtually no one searched for. Does Google really suppress negative results? We have seen what happens with "Hillary Clinton is." What happens with "Donald Trump is "? (Again, be sure to include the space after is.)

(Contact our office for screen shot, DNS report and server log print-outs)

â Donald Trump is â ?

In the above image, captured on August 8th, we again found the odd "awesome" suggestion, but we also saw a suggestion that appears to be negative: "Donald Trump is dead." Shouldn't a result like that have been suppressed? Let's look further.

Consider the following searches, conducted on August 2nd, for "anti Hillary" and "anti Trump." As you can see below, "anti Hillary" generated no suggestions, but "anti Trump" generated four, including "anti Trump cartoon" and "anti Trump song." Well, you say, perhaps there were no anti-Hillary suggestions to be made. But Yahoo â responding merely to "anti Hill" â came up with eight, including "anti Hillary memes" and "anti Hillary jokes."

(Contact our office for screen shot, DNS report and server log print-outs)

â anti Hillaryâ and â anti Trump.â

This seems to further refute Google's claim about not disparaging people, but let's dig deeper.

After Mrs. Clinton named Senator Tim Kaine to be her running mate, Mr. Trump dubbed him with one of his middle-school-style nicknames: "Corrupt Kaine." Sure enough, that instantly became a popular search term on Google, as this July 27th image from Trends confirms:

(Contact our office for screen shot, DNS report and server log print-outs)

â Corrupt Kaine.â

Even so, as you can see in the image below, in response to "corrupt," the Google search bar showed us nothing about Senator Kaine, but it did show us both "Kamala" (Kamala Harris, attorney general of California) and "Karzai" (Hamid Karzai, former president of Afghanistan). If you clicked on the phrases "corrupt Kamala" and "corrupt Karzai," search results appeared that linked to highly negative web pages about Kamala Harris and Hamid Karzai, respectively.

Oddly enough, both on the day we looked up "corrupt Kaine" and more recently when I was writing this essay, Google Trends provided no popularity data for either "corrupt Kamala" or "corrupt Karzai." It is hard to imagine, in any case, that either search term has been popular in recent months. So why did the Google search bar disparage Attorney General Harris and President Karzai but not Mrs. Clinton?

(Contact our office for screen shot, DNS report and server log print-outs)

â corrupt Kaineâ , â corrupt Kamalaâ , â corrupt Karzai.â

If you still have doubts about whether Google suggests negative searches for prominent people, see how Senators Cruz, Rubio and Sanders fared in the following searches conducted between July 23rd and August 2nd:

(Contact our office for screen shot, DNS report and server log print-outs)

Searches conducted between July 23rd and August 2nd - Lying Ted

(Contact our office for screen shot, DNS report and server log print-outs)

Searches conducted between July 23rd and August 2nd - Little Marco

(Contact our office for screen shot, DNS report and server log print-outs)

Searches conducted between July 23rd and August 2nd - Anti-Bernie

I could give you more examples, but you get the idea.

The brazenness of Google's search suggestion tinkering become especially clear when we searched for "crooked" â Mr. Trump's unkind nickname for Mrs. Clinton â on Google, Bing, and Yahoo on various dates in June and July. On Google the word "crooked" alone generated nothing for Mrs. Clinton, even though, once again, its popularity was clear on Google Trends. Now compare (in the image following the Trends graph) what happened on Bing and Yahoo:

(Contact our office for screen shot, DNS report and server log print-outs)

â crookedâ

(Contact our office for screen shot, DNS report and server log print-outs)

â crookedâ

No surprise here. Consistent with Google's own search popularity data, Bing and Yahoo listed "crooked Hillary" near the top of their autocomplete suggestions.

The weird part came when we typed more letters into Google's search bar, trying to force it to suggest "crooked Hillary." On June 9th, I had to go all the way to "crooked H-I-L-L-A" to get a response, and it was not the response I was expecting. Instead of showing me "crooked Hillary," I was shown a phrase that I doubt anyone in the world has ever searched for â "crooked Hillary Bernie":

â crooked H-I-L-L-Aâ

Crooked Hillary Bernie? What the heck does that mean? Not much, obviously, but this is something my associates and I have found repeatedly: When you are able to get Google to make negative suggestions for Mrs. Clinton, they sometimes make no sense and are almost certainly not indicative of what other people are searching for.

Masking and Misleading

There are also indications that autocomplete isn't always pro-Clinton and isn't always anti-Trump, and in this regard the SourceFed video overstated its case. While it is true, for example, that "anti Hillary" generated no suggestions in our study, both "anti Clinton" and "anti Hillary Clinton" did produce negative results when we search on August 8th, as you can see below:

(Contact our office for screen shot, DNS report and server log print-outs)

â anti Clintonâ

(Contact our office for screen shot, DNS report and server log print-outs)

â anti Hillary Clintonâ

At times, we were also able to generate neutral or at least partially positive results for Donald Trump. Consider this image, for example, which shows a search for "Donald Trump" on August 8th:

(Contact our office for screen shot, DNS report and server log print-outs)

Search for â Donald Trumpâ on August 8th

If you believe Google can do no wrong and that it never favors one candidate over another (even though Google and its top executives donated more than \$800,000 to Obama in 2012 and only \$37,000 to Romney), so be it. But trying to be as objective as possible in recent months, my staff and I have concluded that when Google occasionally does give us unbiased election-related search suggestions, it might just be trying to confuse us. Let me explain.

When Ronald Robertson and I began conducting [experiments](#) on the power that biased search rankings have over voter preferences, we were immediately struck by the fact that few people could detect the bias in the search results we showed them, even when those results were extremely biased. We immediately wondered whether we could mask the bias in our results so that even fewer people could detect it. To our amazement, we found that a very simple mask â putting a search result that favored the opposing candidate into the third search position (out of 10 positions on the first page of search results) â was enough to fool all of our study participants into thinking they were seeing unbiased search results.

*Masking a manipulation is easy, and Google is a master of obfuscation, as I explained a few years ago in my *TIME* essay, "[Google's Dance](#)." In the context of autocomplete, all you have to do to confuse people is introduce a few exceptions to the rule. So "anti Clinton" and "anti Hillary Clinton" produce negative search suggestions, while "anti Hillary" does not. Because those counter-examples exist, we immediately forget about the odd thing that's happening with "anti Hillary," and we also ignore the fact that "anti Donald" produces negative suggestions:*

(Contact our office for screen shot, DNS report and server log print-outs)

â anti Donaldâ

Meanwhile, day after day â at least for the few weeks we were monitoring this term â "anti Hillary" continued to produce no suggestions. Why would Google have singled out this one phrase to protect? As always, when you are dealing with the best number crunchers in the world, the answer has to do with numbers. What do you notice when you look below at the frequency of searches for the three anti-Hillary phrases?

(Contact our office for screen shot, DNS report and server log print-outs)

â anti Hillaryâ

That's right. "Anti Hillary" was drawing the most traffic, so that was the phrase to protect.

Sourcefed's video was overstated, but, overall, our investigation supports Sourcefed's claim that Google's autocomplete tool is biased to favor Mrs. Clinton â sometimes dramatically so, sometimes more subtly.

Sputnik's Recent Claims

All of the examples I've given you of apparent bias in Google's search suggestions are old and out of date â conducted by me and my staff over the summer of 2016. Generally speaking, you won't be able to confirm what we found (which is why I am showing you screen shots). This is mainly because search suggestions keep changing. So the big question is: Do new search suggestions favor Mr. Trump or Mrs. Clinton.

Recently, [Sputnik News reported](#) that Google was suppressing search suggestions related to trending news stories expressing concern about Mrs. Clinton's health. Sure enough, as you can see in the following screen shots captured on August 29th,

suggestions on Bing and Yahoo reflected the trending news, but suggestions on Google did not:

(Contact our office for screen shot, DNS report and server log print-outs)

Bing

(Contact our office for screen shot, DNS report and server log print-outs)

Yahoo

(Contact our office for screen shot, DNS report and server log print-outs)

Google

And, yes, once again, Google Trends showed a recent spike in searches for the missing search suggestions:

(Contact our office for screen shot, DNS report and server log print-outs)

Google Trends

While the news was buzzing about Mrs. Clinton's health, hundreds of stories were also being published about Mr. Trump's "flip flopping" on immigration issues, and that too was reflected on Google Trends:

(Contact our office for screen shot, DNS report and server log print-outs)

Mr. Trump's flip flopping

But, as you can see, Google did not suppress "Donald Trump flip flops" from its suggestions:

(Contact our office for screen shot, DNS report and server log print-outs)

Donald Trump flip flops

Google, it seems, is playing this game both consistently and slyly. It is saving its bias for the most valuable real estate â trending, high-value terms â and eliminating signs of bias for terms that have lost their value.

And that brings me, at last, to a research project I initiated only a few weeks ago. If Google is really biasing its search suggestions, what is the company's motive? A new study sheds surprising and disturbing light on this question.

How Google's Search Suggestions Affect Our Searches

Normally, I wouldn't talk publicly about the early results of a long-term research project I have not yet published in a scientific journal or at least presented at a scientific conference. I have decided to make an exception this time for three reasons: First, the results of the study on autocomplete I completed recently are strong and easy to interpret. Second, these results are consistent with volumes of research that has already been conducted on two well-known psychological processes: negativity bias and confirmation bias. And third, the November election is growing near, and the results of my new experiment are relevant to that election â perhaps even of crucial importance.

I began the new study asking myself why Google would want to suppress negative search suggestions. Why those in particular?

In the study, a diverse group of 300 people from 44 U.S. states were asked which of four search suggestions they would likely click on if they were trying to learn more about either Mike Pence, the Republican candidate for vice president, or Tim Kaine, the Democratic candidate for vice president. They could also select a fifth option in order to type their own search terms. Here is an example of what a search looked like:

(Contact our office for screen shot, DNS report and server log print-outs)

Tim Kaine

*Two of the searches we showed people contained negative search suggestions (one negative suggestion in each search); all of the other search suggestions were either neutral (like "Tim Kaine **office**") or positive (like "Mike Pence **for vice president**").*

*Each of the negative suggestions â "Mike Pence **scandal**" and "Tim Kaine **scandal**" â appeared only once in the experiment. Thus, if study participants were treating negative items the same way they treated the other four alternatives in a given search, the negative items would have attracted about 20 percent of the clicks in each search.*

By including or suppressing negatives in search suggestions, you can direct people's searches one way or another just as surely as if they were dogs on a leash.

But that's not what happened. The three main findings were as follows:

1) Overall, people clicked on the negative items about 40 percent of the time â that's twice as often as one would expect by chance. What's more, compared with the neutral items we showed people in searches that served as controls, negative items were selected about five times as often.

2) Among eligible, undecided voters â the impressionable people who decide close elections â negative items attracted more than 15 times as many clicks as neutral items attracted in matched control questions.

3) People affiliated with one political party selected the negative suggestion for the candidate from their own party less frequently than the negative suggestion for the other candidate. In other words, negative suggestions attracted the largest number of clicks when they were consistent with people's biases.

These findings are consistent with two well-known phenomena in the social sciences: negativity bias and confirmation bias.

Negativity bias refers to the fact that people are far more affected by negative stimuli than by positive ones. As a [famous paper](#) on the subject notes, a single cockroach in one's salad ruins the whole salad, but a piece of candy placed on a plate of disgusting crud will not make that crud seem even slightly more palatable.

Negative stimuli draw more attention than neutral or positive ones, they activate more behavior, and they create stronger impressions â negative ones, of course. In recent years, [political scientists have even suggested](#) that negativity bias plays an important role in the political choices we make â that people adopt conservative political views because they have a heightened sensitivity to negative stimuli.

Confirmation bias refers to the fact that people almost always seek out, pay attention to, and believe information that confirms their beliefs more than they seek out, pay attention to, or believe information that contradicts those beliefs.

When you apply these two principles to search suggestions, they predict that people are far more likely to click on negative search suggestions than on neutral or positive ones â especially when those negative suggestions are consistent with their own beliefs. This is exactly what the new study confirms.

Google data analysts know this too. They know because they have ready access to billions of pieces of data showing exactly how many times people click on negative search suggestions. They also know exactly how many times people click on every other kind of search suggestion one can categorize.

To put this another way, what I and other researchers must stumble upon and can study only crudely, Google employees can study with exquisite precision every day.

Given Google's [strong support](#) for Mrs. Clinton, it seems reasonable to conjecture that Google employees manually suppress negative search suggestions relating to Clinton in order to reduce the number of searches people conduct that will expose them to anti-Clinton content. They appear to work a bit less hard to suppress negative search suggestions for Mr. Trump, Senator Sanders, Senator Cruz, and other prominent people.

This is not the place to review the evidence that Google strongly supports Mrs. Clinton, but since we're talking about Google's search bar, here are two quick reminders:

First, on August 6th, when we typed "When is the election?," we were shown the following image:

(Contact our office for screen shot, DNS report and server log print-outs)

â When is the election?â

See anything odd about that picture? Couldn't Google have displayed two photos just as easily as it displayed one?

And second, as reported by [the Next Web](#) and other news sources, in mid 2015, when people typed "Who will be the next president?," Google displayed boxes such as the one below, which left no doubt about the answer:

(Contact our office for screen shot, DNS report and server log print-outs)

â Who will be the next president?â

Corporate Control

Over time, differentially suppressing negative search suggestions will repeatedly expose millions of people to far more positive search results for one political candidate than for the other. Research I have been conducting since 2013 with Ronald Robertson of Northeastern University has shown that high-ranking search results that favor one candidate can easily shift 20 percent or more of undecided voters toward that candidate â up to 80 percent in some demographic groups, as I noted earlier. This is because of the enormous trust people have in computer-generated search results, which people mistakenly believe are completely impartial and objective â just as they mistakenly believe search suggestions are completely impartial and objective.

The impact of biased search rankings on opinions, which we call the [Search Engine Manipulation Effect](#) (SEME), is one of the largest effects ever discovered in the behavioral sciences, and because it is invisible to users, it is [especially dangerous](#) as a source of influence. Because Google handles 90 percent of search in most countries and because many elections are very close, we estimate that SEME has been determining the outcomes of upwards of 25 percent of the national elections in the world for several years now, with increasing impact each year. This is occurring, we believe, whether or not Google's executives are taking an active interest in elections; all by itself, Google's search algorithm virtually always ends up favoring one candidate over another simply because of "organic" search patterns by users. When it does, votes shift; in large elections, millions of votes can be shifted. You can think of this as a kind of digital bandwagon effect.

The new effect I have described in this essay â a search suggestion effect â is very different from SEME but almost certainly increases SEME's impact. If you can surreptitiously [nudge](#) people into generating search results that are inherently biased, the battle is half won. Simply by including or suppressing negatives in search suggestions, you can direct people's searches one way or another just as surely as if they were dogs on a leash, and you can use this subtle form of influence not just to alter people's views

about candidates but about anything.

Google [launched autocomplete](#), its search suggestion tool, in 2004 as an opt-in that helped users find information faster. Perhaps that's all it was in the beginning, but just as Google itself has morphed from being a cool high-tech anomaly into what former Google executive [James Whittaker](#) has called a "an advertising company with a single corporate-mandated focus," so has autocomplete morphed from being a cool and helpful search tool into what may be a tool of corporate manipulation. By 2008, not only was autocomplete no longer an opt-in feature, there was no way to opt out of it, and since that time, through [strategic censorship](#), it may have become a tool for directing people's searches and thereby influencing not only the choices they make but even the thoughts they think.

Look back at the searches I have shown you. Why does Google typically show you far fewer search suggestions than other search engines do â 4 or fewer, generally speaking, compared with 8 for Bing, 8 for DuckDuckGo and 10 for Yahoo? Even if you knew nothing of phenomena like negativity bias and confirmation bias, you certainly know that shorter lists give people fewer choices. Whatever autocomplete was in the beginning, its main function may now be to manipulate.

Without whistleblowers or warrants, no one can prove Google executives are using digital shenanigans to influence elections, but I don't see how we can rule out that possibility.

Perhaps you are skeptical about my claims. Perhaps you are also not seeing, on balance, a pro-Hillary bias in the search suggestions you receive on your computer. Perhaps you are also not concerned about the possibility that search suggestions can be used systematically to nudge people's searches in one direction or another. If you are skeptical in any or all of these ways, ask yourself this: Why, to begin with, is Google censoring its search suggestions? (And it certainly [acknowledges](#) doing so.) Why doesn't it just show us, say, the top ten most popular searches related to whatever we are typing? Why, in particular, is it suppressing negative information? Are Google's leaders afraid we will have panic attacks and sue the company if we are directed to dark and disturbing web pages? Do they not trust us to make up our own minds about things? Do they think we are children?

Without whistleblowers or warrants, no one can prove Google executives are using digital shenanigans to influence elections, but I don't see how we can rule out that possibility. There is nothing illegal about manipulating people using search suggestions and search rankings â [quite the contrary](#), in fact â and it makes good financial sense for a company to use every legal means at its disposal to support its preferred candidates.

Using the mathematical techniques Robertson and I described in our [2015 report](#) in the Proceedings of the National Academy of Sciences, I recently calculated that SEME alone can shift between 2.6 and 10.4 million votes in the upcoming US presidential race without anyone knowing this has occurred and without leaving a paper trail.

I arrived at those numbers before I knew about the power search suggestions have to alter searches. The new study suggests that autocomplete alone might be able to shift between 800,000 and 3.2 million votes â also without anyone knowing this is occurring.

Perhaps even more troubling, because Google tracks and monitors us so aggressively, [Google officials know](#) who among us is planning to vote and whom we are planning to vote for. They also know who among us are still undecided, and that is where the influence of biased search suggestions and biased search rankings could be applied with enormous effect.

[Postscript: Google declined to comment on the record when queried about some of the concerns I have raised in this article. Instead, on August 17th, a company representative sent me to a [blog post](#) released by the company on June 16th; you can read Google's official position on autocomplete there.]

ROBERT EPSTEIN ([@DrEpstein](#)) is Senior Research Psychologist at the [American Institute for Behavioral Research and Technology](#) in Vista, California. A PhD of Harvard University, Epstein has published fifteen books on artificial intelligence and other topics. He is also the former editor-in-chief of *Psychology Today*.

Further, Plaintiffs conducted duplicative forensic research using internet technology specialists and advice from FBI and Congressional forensics experts along with the placement of thousands of server test nodes around the globe for a multi-year period and discovered that the above internment and media assertions about Defendants, by third party investigators were true. Since prior to the inception of Google, Google executives and VCâ s have carried out an acrimonious copy-cat, aggression, black-listing, brand damaging and interference campaign against Plaintiffs because Defendants were too unskilled at creating their own

technology or competing in a fair market without using cheating and bribery tactics.

Key points of this case include the following facts:

A. Defendants have formed a â Cartelâ , as defined by law under RICO Racketeering Statutes and were the financiers of the political campaigns and received payola and kick-backs from those campaigns.

B. In exchange for financing those political campaigns, Defendants Clients gave Defendants Associates lithium ion battery monopolies, solar panel monopolies, data processing government contract monopolies and media distribution exclusives worth trillions of dollars. This was an illegal quid-pro-quo arrangement. Plaintiffs designed, produced, received patent awards on, received federal commendations for, received federal funding for and first marketed the very products which Defendants copied and made billions of dollars on and which Defendants felt might beat them in hundreds of billions of dollars of competitive market positions and stock market trades. Companies operated by Plaintiffs included automobile design and manufacturing companies, global television broadcasting companies and energy companies which are commonly known to have generated hundreds of billions of dollars in profits, revenue and stock market transactions for Defendants competing holdings at Plaintiffs expense. Defendants operated a criminal CARTEL as defined by RICO LAWS and that Cartel ran an anti-trust market rigging and crony political payola operation. Defendants spent tens of millions of dollars attacking Plaintiffs because Defendants were not clever enough to build better products. Defendants chose to â CHEAT RATHER THAN COMPETEâ and to try to kill Plaintiffs lives, careers, brands, revenues, assets, businesses and efforts via malicious and ongoing efforts.

C. U.S. Attorney General Eric Holder, Bill Barr, Jefferson B. Sessions III, et al, has been informed, in writing, of these charges and Plaintiffs understand that DOJ officials have an ongoing investigation into these matters.

D. Due to Defendants fears of the loss of up a trillion dollars of crony payola from the illegal abuse of taxpayer funds and Defendants warnings from White House staff that the crony scheme must â never come to lightâ , Defendants engaged in felonious gangster-like actions in order seek to terminate all witnesses, reporters and opposition government staff who attempted to expose these crimes.

E. Just as, over time, the Watergate crimes are now intimately documented and detailed; over time The â Cleantech Crash Scandalâ as featured on **CBS News 60 MINUTES** TV Show, has been detailed and exposed in numerous federal, news media and public investigations. Significant barriers to justice were illicitly placed in front of Plaintiffs by Defendants.

F. Defendants organized and operated a series of malicious attacks and thefts against Plaintiffs as reprisals and competitive vendettas. Defendants report to the FBI, GAO, FTC, SEC, Congressional Ethics Committees, Trump Administration and other entities on a regular basis. Plaintiffs have received evidence from those entities as well as Wikileaks, Drudge Report, *wearethenewmedia.com* groups, private investigators and former employees of Defendants.

G. Defendants and their associates Elon Musk, Jon Doerr, Eric Schmidt, Larry Page, Steve Jurvetson, Vinod Khosla and other members of the â Silicon Mafiaâ are documented in tens of thousands of news reports, federal law enforcement reports and Congressional reports in their attempts to infiltrate and corrupt the U.S. Government in an attempt to route trillions of tax dollars to Defendants private accounts. Defendants perceived Plaintiffs as a threat to their crimes. Federal investigators, news investigators and whistle-blowers have reported to Plaintiffs that Defendants were the financiers and/or beneficiaries and/or command and control operatives for the crimes and corruption disclosed in the CBS NEWS 60 Minutes investigative reports entitled: â The Cleantech Crashâ , â The Lobbyists Playbookâ and â Congress Trading on Insider Informationâ ; The Feature Film: â The Car and the Senatorâ Federal lawsuits with case numbers of: USCA Case #16-5279; and over 50 other cases including the ongoing

â Solyndraâ investigation and federal and Congressional investigations detailed at <http://greencorruption.blogspot.com/> ;

<http://www.skybase.us> ;

<https://theintercept.com/2016/04/22/googles-remarkably-close-relationship-with-the-obama-white-house-in-two-charts>

and thousands of other documentation sites. Plaintiffs are charged with engaging in these crimes and corruptions against Plaintiffs and financing and ordering attacks on Plaintiffs. Plaintiffs engaged in U.S. commerce and did everything properly and legally. Unlike Defendants, Plaintiffs did not steal technology. Unlike Defendants, Plaintiffs did not bribe elected officials in order to get market exclusives. Unlike Defendants, Plaintiffs did not poach Defendants staff. Unlike Defendants, Plaintiffs were the original inventors of their products. Unlike Defendants, Plaintiffs did not operate â AngelGate Collusionâ schemes and â High Tech No Poaching Secret Agreementsâ and a Mafia-like Silicon Valley exclusionary Cartel. Unlike Defendants, Plaintiffs did not place their employees in the U.S. Government, The California Government, The U.S. Patent Office and The U.S. Department of Energy in order to control government contracts to Defendants exclusive advantage. Unlike Defendants, Plaintiffs did not place moles inside of competitors companies. Unlike Defendants, Plaintiffs did not hire Gawker Media and Think Progress to seek to kill Plaintiffs careers, lives and brands. Unlike Defendants, Plaintiffs did not rig the stock market with â pump-and-dumpâ , â Flash Boyâ and â Google-stock/PR-pumpâ schemes. Plaintiffs engaged in hard work every day of their lives for the time-frame in question under the belief that the good old American work ethic and just rewards for your creations was still in effect in the U.S.A., and that the thieves and criminals that attempted to interdict Plaintiffs would face Justice. In a number of circumstances Defendants took advantages of Plaintiffs hard work via come-ons; Defendants then made billions of dollars from Plaintiffs work at Plaintiffs expense and attacked Plaintiffs in order to reduce Plaintiffs competitive and legal recovery options.

H. Defendants compensated the White House staff with cash, stock warrants, illicit personal services, media control and a technology known as a â Streisand Effect Massive Server Arrayâ which can control public impressions for, or against a person, party, ideology or issue. Defendants Streisand Effect internet system was used to destroy Plaintiffs in reprisal, retribution, and vendetta for Plaintiffs help with law enforcement efforts in the case and because Plaintiffs companies competed with Defendants companies with superior technologies.

I. Defendants have used their Streisand Effect technology to build a character assassination ring of bloggers and hired shill â reportersâ who engage in a process called a â Shivaâ . This process is named after a Plaintiff in a similar case named: Shiva Ayyadurai, the husband of Actress Fran Drescher. Shiva Ayyadurai holds intellectual property rights to part of Defendants email technology. In fact, the people most threatened by the Shiva Ayyadurai patent right claims, ironically turn out to be Defendants and, in particular, Defendants associates Elon Musk, Jon Doerr, Eric Schmidt, Larry Page, Steve Jurvetson, Vinod Khosla and other members of the â Silicon Mafiaâ who own most of the main companies exploiting email technology. Were Shiva Ayyadurai to prevail in his claims, Defendants would owe him billions of dollars. â Running A Shivaâ involves the production of a series of Defamation articles by bloggers who act as if they are independent from Defendants but are in fact, not. Defendants used â the Shivaâ to attack and seek to destroy Donald Trump, Shiva Ayyadurai, Plaintiffs, and numerous political figures. Univision, Unimoda, Jalopnik, Gawker Media, Gizmodo and over a hundred stealth-ed, and overt, assets of Defendants have been using â The Shivaâ network to attack Donald Trump, Shiva Ayyadurai, Plaintiffs, and numerous political figures as recently as this morning, thus, the time bar restarts every day. Plaintiffs have pleaded with Defendants to cease their attacks but Defendants have refused to comply. Even with Fran Drescherâ s ongoing royalty payments from her popular television series, friends have reported that the attacks on the Ayyadurai family have been devastating and have caused massive damages and personal and emotional devastation.

J. Defendants produced animated movies, attack articles, fake blog comments, DNS routes, â Shivaâ Campaigns, and other attack media against Plaintiffs and expended over \$30 million dollars in value, as quantified by Defendants partner: Google, in placing the attack material in front of 7.5 billion people on the planet for the rest of Plaintiffs lifetime. No person could survive such an attack and in the case of Plaintiffs, lives were destroyed and multiple companies invested into by Plaintiffs, which Defendants made over \$50B off of the copies of, were destroyed because they competed with Defendants.

K. Defendants have paid almost every high technology law firm that is capable of undertaking Plaintiffâ s case to NOT take Plaintiffs case. Defendants have threatened law firms with Black-Listing and the loss of Defendants lucrative business if any law-firm were to take Plaintiffs cases. This is a violation of Plaintiffâ s State and Federal Constitutional rights and DOJ must step in to operate the case on Plaintiffâ s behalf.

L. (SEALED EVIDENCE)

FURTHER:

The Plaintiffs are informed and believe, and based on that information and belief allege that at all times mentioned in the within Complaint, all Defendants were the agents, owners and employees of their co-Defendants and, in doing the things alleged in this Complaint, were acting within the course and scope of such agency and employment.

As to any corporate employer specifically named, or named as a â DOEâ herein, the Plaintiffs are informed and believe and therefore allege that any act, conduct, course of conduct or omission, alleged herein to have been undertaken with sufficient, malice, fraud and oppression to justify an award of punitive damages, was, in fact, completed with the advance knowledge and conscious disregard, authorization, or ratification of and by an officer, director, or managing agent of such corporation. The Statute of Limitations and time bar on this case has not expired. Plaintiffs only became aware of all of the facts in 2017 due to the FBI, Congressional and hacker-exposed investigation data on Defendants operating and receiving cash, rewards and assets from an illegal and illicit set of political slush-funds established to compensate them for financing political campaigns. The Sony, Clinton, DNC, HSBC, Panama Papers and other hacks and publication of all of the relevant files and the Congressional investigation of illicit activities and the continuing issuance of federal documents to Plaintiffs confirming Plaintiffs intellectual property are all vastly WITHIN the statutes of limitations to allow this case to proceed to Jury Trial. Plaintiffs has had a long, ongoing and high-level interaction with Defendant in both the work effort and the monetization and collection effort. Plaintiffs has been continually interactive with Defendant in order to try to collect his money. Attacks and interference with Plaintiffs has occurred as recently as this week by Defendants.

ADDITIONAL CASE HISTORY OVERVIEW

Defendants are among the largest financiers and/or beneficiaries and/or command and control operatives for political quid-pro-quo campaigns.

Mining magnates (ie: Guistra, et al) and investment bank executives who controlled mined commodities stock trades co-financed the political campaigns and had a quid-pro-quo relationship with defendants for lithium, indium, copper and all rare earth metals used in batteries, solar panels and the exact mined materials that the political campaigns promised an exclusive on, and in fact, delivered a monopolistic exclusive market on to Defendants. Defendants produced vast numbers of documentation valuing their crony kick-back payola deal at â Over six trillion dollarsâ , promoted by USAID and Goldman Sachs agents. One can easily see the types of criminal measures Defendants might undertake in order to steal, embezzle or monopoly route such an outrageous potential sum to their personal bank accounts.

Because Defendants were engaged in the operation of â *an organized crime racketeering operation protected by White House staff in the Obama Administration*â , according to FBI and Congressional sources, Defendants felt insulated, arrogant and above the law. Defendants undertook extreme attacks against Plaintiffs because their â Frat Boyâ elitist egoâ s were bruised and they thought they were â *untouchable*â . Defendants did not believe that any Elliot Ness-class agents still existed at the FBI. They were wrong. Defendants staged the following attacks on Plaintiffs as described in the text of this report: â *While most*

people may think that a "hit-jobs" are the realm of Hollywood movie plots, these kinds of corporate assassination attempts do take place daily in big business and politics. At the request of the U.S. Government, Plaintiffs developed and patented an energy technology that affected trillions of dollars of oil company and technology billionaire insider profits. They didn't realize this at the time. Let me make this point clearly: The control of Trillions of dollars of energy industry profits were being fought over by two groups and the Government plunked Plaintiffs down in the middle of that war. Plaintiffs had no affiliation with either group. They thought they were just accepting a challenge to help their nation and were not aware that Defendants had infected the entire process with crony corruption insider schemes.

One of the Plaintiffs won commendation from the U.S. Congress in the Iraq War Bill. They won federal patents. They won a Congressional grant. They won a huge number of letters of acclaim and they won the wrath of a handful of insane Silicon Valley billionaires who could not compete with Plaintiffs technology. Defendants chose to a "...CHEAT RATHER THAN COMPETE!"

The attacks were carried out by California State employees and U.S. Government officials who had received stock, perks, and other quid-pro-quo payment from these billionaires.

Department of Energy Executives and their campaign billionaire handlers engaged in these attacks in order to control the solar and "green car" markets in violation of anti-trust laws. The billionaires did not care about a "green" issues, they only cared about green cash.

Federal and state employees ran retribution campaigns against applicants who competed with inside deals they had set up to line their own pockets at taxpayer expense.

These corrupt politicians thought they could take over a promised a "six trillion dollar "Cleantech" industry that was being created to exploit new insider exploitation opportunities around global warming and Middle East disruption. After an epic number of Solyndra-esque failures, all owned by the Department of Energy Executives and their campaign financiers, the scheme fell apart. The non crony applicants suffered the worst fates. As CBS News reporter Cheryl Atkisson has reported, the willingness to engage in media "hit-jobs" was only exceeded by the audacity with which Department of Energy officials employed such tactics.

Now, in a number of notorious trials and email leaks, including the Hulk Hogan lawsuit and the DNC and Panama Papers leaks, the public has gotten to see the depths to which public officials are willing to stoop to cheat rather than compete in the open market.

Department of Energy employees and State of California employees engaged in the following documented attacks against applicants who were competing with their billionaire backers personal stock holdings. Plaintiffs and the other applicants including Bright Automotive, Aptera, ZAP and many more, suffered these attacks:

- Social Security, SSI, SDI, Disability and other earned benefits were stone-walled. Applications were "lost". Files in the application process "disappeared". Lois Lerner hard drive "incidents" took place.

- Defendants had lawyers employed by Defendants contact Plaintiffs and offer to "help" Plaintiffs when, in fact, those lawyers worked for Defendants and were sent in as moles to try to delay the filing of a case in order to try to run out the time bar.

- State and federal employees played an endless game of Catch-22 by arbitrarily determining that deadlines had passed that they, the government officials, had stonewalled and obfuscated applications for, in order to force these deadlines that they set, to appear to be missed.

- Some applicants found themselves strangely poisoned, not unlike the Alexander Litvenko and Rodgers cases. Heavy metals and toxic materials were found right after their work with the Department of Energy weapons and energy facilities. Many wonder if these "targets" were intentionally exposed to toxins in retribution for their testimony. The federal MSDS documents clearly show that a number of these people were exposed to deadly compounds and radiations without being provided with proper HazMat suits which DOE officials knew were required.

- Applicants employers were called, and faxed, and ordered to fire applicants from their places of employment, in the middle of the day, with no notice, as a retribution tactic.

- Applicants HR and employment records, on recruiting and hiring databases, were embedded with negative keywords in order to prevent them from gaining future employment.

- One Gary D. Conley, one Seth Rich and one Rajeev Motwani, all whistle-blowers in this matter, turned up dead under strange circumstances. They are not alone in a series of bizarre deaths related to the DOE. The many suspiciously dead parties are all connected to acrimonious relationships with Defendants.

- Disability and VA complaint hearings and benefits were frozen, delayed, denied or subjected to lost records and "missing hard drives" as in the Lois Lerner case.

- Paypal and other on-line payments for on-line sales were delayed, hidden, or re-directed in order to terminate income potential for applicants who competed with DOE interests and holdings.

- DNS redirection, website spoofing which sent applicants websites to dead ends and other Internet activity manipulations were conducted.

- Campaign finance dirty tricks contractors IN-Q-Tel, Think Progress, Media Matters, Gawker Media, Syd Blumenthal, etc., were hired by DOE Executives and their campaign financiers to attack applicants who competed with DOE executives stocks and personal assets.

- Covert DOE partner: Google, transferred large sums of cash to dirty tricks contractors and then manually locked the media portion of the attacks into the top lines of the top pages of all Google searches globally, for years, with hidden embedded codes in the links and web-pages which multiplied the attacks on applicants by many magnitudes.

- Honeytraps and moles from persons employed by Defendants or living on, or with, Defendants were employed by the attackers. In this tactic, people who covertly worked for the attackers were employed to approach the "target" and offer business or sexual services in order to spy on and misdirect the subject.

- Mortgage and rental applications had red flags added to them in databases to prevent the targets from getting homes or apartments.

- McCarthy-Era "Black-lists" were created and employed against applicants who competed with DOE executives and their campaign financiers to prevent them from funding and future employment. The Silicon Valley Cartel (AKA the "PayPal Mafia" or the "Silicon Valley Mafia") placed Plaintiffs on their "Black-List".

- Targets were very carefully placed in a position of not being able to get jobs, unemployment benefits, disability benefits or acquire any possible sources of income. The retribution tactics were audacious, overt..and quite illegal.

While law enforcement, regulators and journalists are now clamping down on each and every one of the attackers, one-by-one, the process is slow. The victims have been forced to turn to the filing of lawsuits in order to seek justice. The Mississippi Attorney General's office, who is prosecuting Cartel Member Google, advised Plaintiffs to pursue their case in civil court while the Post Election FBI expands its resources.

While Defendants have sought to mock Plaintiffs exposure of Defendants organized crime operation by denigrating Plaintiffs data as "Conspiracy Theory", the articles located at:

3.) How, After This Crazy Year, Is "Conspiracy Theorist" Still Being Used As An Insult?

<http://www.newslogue.com/debate/152>

[...and thousands of other links prove that Defendants further attempts to malign Plaintiffs over their conspiracy FACTS are ill advised.](#)

Defendants, since before 1999, have regularly approached Plaintiffs and each of their companies in the internet, green building, aerospace, telecomm, internet video, fuels, energy and other industries through various agents and intermediaries with offers of pretension to â invest inâ or â partner withâ Plaintiffs. In each and every case, Defendants were on a fishing expedition to acquire Plaintiffs technologies, copy those technologies and monetize those technologies under Defendants own brands. When Plaintiffs continued to compete with Defendants copy-cat technologies, Defendants operated hit-jobs against Plaintiffs using their controlled publications like Gawker, Gizmodo, Defendants, Twitter, Facebook, TechDirt and other brand assassination web media manipulation services. Defendants feared the competition of Plaintiffs and were upset by Plaintiffs refusal to participate in their so-called â Silicon Valley White House Coupâ as described by Glenn Greenwald and The Intercept, White House adviser Steve Bannon, Congressional spokesman Newt Gingrich, Jeff Sessions staff, Matt Drudge and thousands of others.

The Plaintiffs had numerous lawyers, specialists and others contacted Defendants requesting a cessation of Defendants harassment and internet manipulation and removal of the rigged attack links and hidden internet codes within the links on Defendants server architecture.

At all times pertinent, the Plaintiffs, including Defendants staff members, Matt Cutts, Forest Timothy Hayes, Defendants legal staff and others refused to assist and commonly replied: â ...just sue us..â , â ...get a subpoena...â , etc., even though the Plaintiffs, and the Plaintiffs representatives, provided the Defendants with extensive volumes of third-party proof clearly demonstrating that not a single statement in the attack links promoted by google was accurate or even remotely true. Defendants knew Plaintiffs personally, knew the attack hit-job article and movie was false and defamatory and took great glee in refusing to remove it for over five years.

YouTube, published a custom produced and targeted attack video that also included false, defamatory, misleading and manufactured information belittling the Plaintiffs, and discrediting their reputation. The video is known to have been produced by Defendants as part of their anti-trust attack program against Plaintiffs.

The Plaintiffs contacted the Defendants, YouTube and Defendants, with many written requests that they delete the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting their reputation as an inventor, project developer and project director from its website. [See, Sample responses of the Defendants Defendants and YouTube, attached as Exhibits and incorporated herein by reference.]

All of the written demands of the Plaintiffs were to no avail and none of the Defendants, agreed to edit, delete, retract or modify any of the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting their reputation as an inventor, product developer and project director from their websites and digital internet and media platforms and architecture.

The Plaintiffs, whose multiple businesses ventures had already suffered significant damage as the result of the online attacks of the Defendants, contacted renowned experts, and especially Search Engine Optimization and forensic internet technology (IT) experts, to clear and clean the internet of the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting their reputation as an inventor, product developer and project director from their websites.

None of the technology experts hired by the Plaintiffs, at substantial expense, were successful in their attempts to clear, manage or even modify the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking him and discrediting their reputation as an inventor, product developer and project director which only Defendants, the controlling entity of the internet, refused to remove. In fact, those experts were able to even more deeply confirm, via technical forensic internet analysis and criminology technology examination techniques that Defendants was rigging internet search results for its own purposes and anti-trust goals.

All efforts, including efforts to suppress or de-rank the results of a name search for â Plaintiffsâ failed, and even though tests on other brands and names, for other unrelated parties did achieve balance, the SEO and IT tests clearly proved that Defendants was consciously, manually, maliciously and intentionally rigging its search engine and adjacent results in order to â mood manipulateâ an attack on Plaintiffs.

In fact, the experts and all of them, instead, informed the Plaintiffs, that, not only had Defendants locked the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting their reputation as an inventor, project developer and project director into its search engine so that the information could never be cleared, managed or even modified, Defendants had assigned the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting their reputation as an inventor, project developer and project director â PR8â algorithmic internet search engine coding embedded in the internet information-set programmed into Defendants internet architecture. [See, Information received from one of over 30 IT, forensic network investigators and forensic SEO test analysts, a true and correct copy of which is attached hereto in the Exhibits.] Plaintiffs even went to the effort of placing nearly a thousand forensic test servers around the globe in order to monitor and metricize the manipulations of search results of examples of the Plaintiffs name in comparison to the manipulations for PR hype for Defendants financial partners, for example: the occurrence of the phrase â Elon Muskâ , Defendants business partner and beneficiary, over a five year period. The EU, China, Russia, and numerous research groups (ie: <http://www.politico.com/magazine/story/2015/08/how-google-could-rig-the-2016-election-121548> By Robert Epstein) have validated these forensic studies of Defendants architect-ed character assassination and partner hype system .

The â PR8â codes are hidden codes within the Defendants software and internet architecture which profess to state that a link is a â factâ or is an authoritative factual document in Defendants opinion. By placing â PR8â codes in the defamatory links that Defendants was manipulating about Plaintiffs, Defendants was seeking to tell the world that the links pointed to â Factsâ and not â Opinionsâ . Defendants embedded many covert codes in their architecture which marketing the material in the attack links and video as â factsâ according to Defendants.

The â PR8â codes are a set of codes assigned and programmed into the internet, by the Defendants to matters it designates as dependable and true, thereby attributing primary status as the most significant and important link to be viewed by online researchers regarding the subject of their search.¹ Defendants was fully aware that all of the information in the attack articles against Plaintiffs was false, Defendants promoted these attacks as vindictive vendetta-like retribution against Plaintiffs.

At all times pertinent Defendants maintained it had no subjective control or input into the rankings of links obtained by online researchers as the result of a search on its search engines and that its search engine algorithms and the functions of its media assets were entirely â arbitraryâ according to the owners and founders of Defendants.

In or about April 15, 2015, The European Union Commission took direct aim at Defendants Inc., charging the Internet-search giant with skewing and rigging search engine results in order to damage those who competed with Defendants business and ideological interests.

In those proceedings, although Defendants continued to maintain that it has no subjective control or input into the rankings of links obtained by online researchers as the result of a search on its search engines and that its staff had no ability to reset, target, mood manipulate, arrange adjacent text or links, up-rank, down-rank or otherwise engage in human input which would change algorithm, search results, perceptions or subliminal perspectives of consumers, voters, or any other class of users of the world wide web, also known as The Internet, the court, in accord with evidence submitted, determined that Defendants, does in fact have and does in fact exercise, subjective control over the results of information revealed by searches on its search engine.²

As a result of receiving this information, the Plaintiffs became convinced of the strength and veracity of their original opinion that the Defendants, had, in fact posted the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking them and discrediting Plaintiffs reputation as inventor, project developer and project designer had been intentionally designed, published, orchestrated and posted by them in retaliation to the true testimony provided by the Plaintiffs, to the Government Office of Accountability of the United States in May of 2005, and to the Securities and Exchange Commission, The Federal Bureau of Investigation, The United States Senate Ethics Committee and other investigating parties, and had been

disseminated maliciously and intentionally by them in an effort to do damage to their reputation and to their business prospects and to cause him severe and irremediable emotional distress.

In fact, the Plaintiffs, has suffered significant and irremediable damage to their reputation and to their financial and business interests. As a natural result of this damage, as intended by the Defendants, Gawker, Defendants and Youtube, the Plaintiffs has also suffered severe and irremediable emotional distress.

To this day, despite the age of the false, defamatory, misleading and manufactured information belittling the Plaintiffs, attacking him and discrediting their reputation , in the event any online researcher searches for information regarding the Plaintiffs, the same information appears at the top of any list of resulting links.

In addition, due to their control of all major internet database interfaces, Defendants have helped to load negative information about Plaintiffs on every major HR and employment database that Plaintiffs might be searched on, thus denying Plaintiffs all reasonable rights to income around the globe by linking every internal job, hiring, recruiter, employment, consulting, contracting or other revenue engagement opportunity for Plaintiffs back to false â red flagâ or negative false background data which is designed to prevent Plaintiffs from future income in retribution for Plaintiffs assistance to federal investigators.³

It should be noted here that, in 2016, one of the companies Plaintiffs was associated with, in cooperation with federal investigations, won a federal anti-corruption lawsuit against the U.S. Department of Energy in which a number of major public officials were forced to resign under corruption charges, federal laws and new legal precedents benefiting the public were created, and Defendants and its associates and related entities found culpable of corruption.

With specific attention to Plaintiffs claims being â personal injury tort...claimsâ under 28 U.S.C. Â§ 157(b)(2)(B) and the inapplicability of the California Anti-SLAPP law, Cal. Code. of Civ. P. Â§ 425.16, to Defendants potential claim objections, and state as follows:

...

Procedural Background

Plaintiffs are residents of the State of California and the Companies are organized and domiciled in that jurisdiction. INDIVIDUAL A is the senior shareholder of the Companies

Defendants employees and contractors maliciously libeled Plaintiffs through its employees and agents: Adrian Covert, and John Herman, A.J. Delaurio, as well as through its pseudonymous authors, including: Adam Dachis, Adam Weinstein, Adrian Covert, Adrien Chen, Alan Henry, Albert Burneko, Alex Balk, Alexander Pareene, Alexandra Philippides, Allison Wentz, Andrew Collins, Andrew Magary, Andrew Orin, Angelica Alzona, Anna Merlan, Ariana Cohen, Ashley Feinberg, Ava Gyurina, Barry Petchesky, Brendan I. Koerner, Brendan Oâ Connor, Brent Rose, Brian Hickey, Camila Cabrer, Choire Sicha, Chris Mohny, Clover Hope, Daniel Morgan, David Matthews, Diana Moskovitz, Eleanor Shechet, Elizabeth Spiers, Elizabeth Starkey, Emily Gould, Emily Herzig, Emma Carmichael, Erin Ryan, Ethan Sommer, Eyal Ebel, Gabrielle Bluestone, Gabrielle Darbyshire, Georgina K. Faircloth, Gregory Howard, Hamilton Nolan, Hannah Keyser, Hudson Hongo. Heather Deitrich, Hugo Schwyzer, Hunter Slaton, Ian Fette, Irin Carmon, James J. Cooke, James King, Jennifer Ouellette, Jesse Oxfeld, Jessica Cohen, Jesus Diaz, Jillian Schulz, Joanna Rothkopf, John Cook, John Herrman, Jordan Sargent, Joseph Keenan Trotter, Josh Stein, Julia Allison, Julianne E. Shepherd, Justin Hyde, Kate Dries, Katharine Trendacosta, Katherine Drummond, Kelly Stout, Kerrie Uthoff, Kevin Draper, Lacey Donohue, Lucy Haller, Luke Malone, Madeleine Davies, Madeline Davis, Mario Aguilar, Matt Hardigree, Matt Novak, Michael Ballaban, Michael

Dobbs, Michael Spinelli, Neal Ungerleider, Nicholas Aster, Nicholas Denton, Omar Kardoudi, Pierre Omidyar, Owen Thomas, Patrick George, Patrick Laffoon, Patrick Redford, Rich Juzwiak, Richard Blakely, Richard Rushfield, Robert Finger, Robert Sorokanich, Rory Waltzer, Rosa Golijan, Ryan Brown, Ryan Goldberg, Sam Faulkner Bidle, Sam Woolley, Samar Kalaf, Sarah Ramey, Shannon Marie Donnelly, Shep McAllister, Sophie Kleeman, Stephen Totilo, Tamar Winberg, Taryn Schweitzer, Taylor McKnight, Thorin Klosowski, Tim Marchman, Timothy Burke, Tobey Grumet Segal, Tom Ley, Tom Scocca, Veronica de Souza, Wes Siler, William Haisley, William Turton and others writing under pseudonyms; through false accusations of vile and disgusting acts, including fraud and false invention.

Defendants engaged in this campaign against Plaintiffs on the pages of its âGizmodoâ, YouTube Channel, Twitter Accounts, âDeadspinâ, âJalopnikâ and other facades under Defendants âGawker.comâ and âUnivisionâ websites. These libels also falsely accused Plaintiffs of lying in his published patents, journals and works-of-art. All of these false and defamatory accusations were published on multiple webpages operated and controlled by Defendants and on social media platforms, such as Twitter and Google, through accounts operated and controlled by Defendants and/or its employees and agents.

These libels, which were also false light invasions of privacy, caused Plaintiffs considerable reputational, emotional, and financial harm, and they so identified him with Plaintiffs that it, too, was a victim of Defendantsâ tortious conduct and suffered reputational and financial harm as well.

Despite being given months to take responsibility for its misdeeds, Defendants failed to retract its libel, apologize, or take any other remedial steps. As set forth the California action, Defendantsâ modus operandi was to make extreme and outrageous statements, without regard for the truth, and without reasonable inquiry, in order to attract readers and generate revenue. As this Court is well aware, that business model ultimately imploded, resulting in multiple lawsuits and a substantial judgment against it.

Among those who decided that Defendants should not be permitted to get away with defamation for profit, Claimants reluctantly took the step to seek justice, risking that Defendants and its functionaries would employ the âStreisand effectâ to republish the false accusations previously made in reporting on the suit itself.

California, Case No. (âIn Pro Per litigationâ) asserting claims for defamation and false light invasion of privacy arising from the aforesaid false and defamatory statements. Under California law, corporations that appear in propria persona may proceed with their right to sue upon the

appearance of counsel for the corporation, which is without prejudice to a defendant. See *CLD Constr., Inc. v. City of San Ramon*, 120 Cal. App. 4th 1141, 1152 (1 st Dist. Ct. App. 2004).

See Cal. Code of Civ. P. Â§ 583.210(a). Claimants, without the assistance of counsel, diligently appeared or attempted to appear at all hearings as required.

Discussion Analysis for Option B Approach:

Defendant is a media company not unlike CNN. Those who accuse CNN and other mainstream media outlets of âfake newsâ will probably revel in a recent decision by a federal judge in Atlanta, Georgia. While Judge Orinda Evans didnât all out declare that CNN was peddling in falsehoods, she did take aim at the network in an initial judgment in favor of a former hospital CEO who sued CNN accusing them of purposely skewing statistics to reflect poorly on a West Palm Beach hospital. Judge Evans didnât mince words in her 18-page order allowing the case to move forward, and dismissing CNNâs attempt to get it thrown out of court.

Davide Carbone, former CEO of St. Mary's Medical Center in West Palm Beach, filed a defamation lawsuit against CNN after they aired what he claims were a series of false and defamatory news reports regarding the infant mortality rate at the hospital. CNN's report said the mortality rate was three times the national average. However, Mr. Carbone contends that CNN intentionally manipulated statistics to bolster their report. He also claims that CNN purposely ignored information that would look favorable to the hospital in order to sensationalize the story.

In our case, we contended that CNN essentially made up its own standard in order to conduct an apples to oranges comparison to support its false assertion that St. Mary's mortality rate was 3 times higher than the national average. Accordingly, the case against CNN certainly fits the description of media-created Fake News,' said Carbone's attorney L. Lin Wood, in a statement to LawNewz.com.

Wood says that as a result of CNN's story Carbone lost his job and it became extremely difficult for him to find new employment in the field of hospital administration.

False and defamatory accusations against real people have serious consequences. Neither St. Mary's or Mr. Carbone did anything to deserve being the objects of the heinous accusation that they harmed or put babies and young children at risk for profit,' Wood said.

On Wednesday, Federal District Judge Orinda Evans ruled that the case could move forward, even ruling that she found that CNN may have acted with actual malice with the report a standard necessary to prove a defamation claim.

The Court finds these allegations sufficient to establish that CNN was acting recklessly with regard to the accuracy of its report, i.e., with actual malice, the order reads. CNN had tried to get the case dismissed.

Nothing in the legislative history indicates that defamation or invasion of privacy claims are not personal injury torts. In fact, all of the history provided by Defendants would preclude their narrow interpretation when Congress was expressly acting to ensure the district court would hear such claims. Similarly, although some courts have permitted the California Anti-SLAPP law to be heard in cases involving diversity jurisdiction, it does not follow that the procedural mechanisms can apply in an objection to claim proceeding.

Defendants also neglects to mention its ongoing, post-petition libel. See, e.g., Trotter, J.K., What did Internet Troll Chuck Johnson Know about Peter Thiel's Secret War on Gawker? (Jun. 17, 2016) (reiterating false accusation of misreporting a story about Sen. Menendez) available at <<http://gawker.com/what-did-internet-troll-chuck-johnson-know-about-peter-1782110939>>.

At that hearing and in response to objections to claims, other claimants also argued that the district court was required to hear defamation claims as personal injury claims under 28 U.S.C. Â§ 157(b)(2)(B).

Although Defendants mentions the reorganization of authority between the bankruptcy courts and the district courts in the wake of Northern Pipeline Construction Co. v. Marathon Pipeline Co., 458 U.S. 50 (1982), it fails to explain what motivated the Marathon decision.

The concern in that case was the extent to which Congress could empower Article I courts. The Supreme Court specifically observed that “Congress cannot withdraw from [Art. III] judicial cognizance any matter which, from its nature, is the subject of a suit at the common law, or in equity, or admiralty.” 458 U.S. at 69 n.23, quoting *Murray’s Lessee v. Hoboken Land & Improvement Co.*, 18 How. 272, 284 (1856). Such suits involved “private rights”, as opposed to “public rights” created legislatively.

During debate over the Bankruptcy Amendments and Federal Judgeship Act of 1983, Pub. L. 98-353, Senator Robert Dole specifically noted: This title establishes an article I bankruptcy court, with judges appointed for limited terms, to handle the routine business of bankruptcy claims based upon State law, which under Marathon will require the attention of article III judges, will be referred to the district courts except where the parties consent to bankruptcy court jurisdiction. One of those areas reserved for attention of the district courts will be personal injury claims, which are exempted from the definition of core proceeding under the bill. 130 Cong. Rec. S20083 (daily ed. June 29, 1984).

However, none of the legislative history, including that cited by Defendants, specifically addresses whether defamation claims are “personal injury” claims. 5i.

Slander and Libel are Common-Law Personal Injury Claims

In determining the meaning of “personal injury”, this Court must look to the common law understanding. Over a century ago, in determining whether a slander was among the “willful and malicious injuries to the person or property of another” not discharged in bankruptcy, the Kentucky Court of Appeals found that a slander is a “personal injury” that is, an injury to his person, and further explained its holding in the context that “[t]he act of Congress must be 5

There is no inconsistency with including defamation claims among the “narrow range of cases” that are personal injury cases raised by Rep. Kastenmeir. 130 Cong. Rec. H7491. As Defendants notes, the sole example was an automobile accident claim; by Defendants’ logic, all medical malpractice claims would be excluded. None of the remainder of the legislative history cited provides any further insight.

It is understood as having used the words in the section quoted with reference to their common-law acceptance. *Sutherland on Statutory Construction*, 289. *Sanderson v. Hunt*, 116 Ky. 435, 438, 76 S.W. 179, 179 (1903); accord *McDonald v. Brown*, 23 R.I. 546, 51 A. 213 (1902); *Nat’l Sur. Co. v. Medlock*, 2 Ga. App. 665, 58 S.E. 1131 (1907). The *Sanderson* decision was adopted by the Sixth Circuit Court of Appeals, similarly finding a libel to be a “personal injury” under the common law such that it would not be dischargeable under the bankruptcy act. *Thompson v. Judy*, 169 F. 553 (6th Cir. 1909); 6 see also *Parker v. Brattan*, 120 Md. 428, 434-35, 87 A. 756, 758 (1913). This understanding was also adopted by at least one district court in the Second Circuit. See *In re Bernard*, 278 F.734, 735 (E.D.N.Y. 1921). 14.

Congress, in drafting Section 157(b)(2)(B) must, therefore, be understood as having used the words "personal injury" with reference to its common-law acceptance. From the earliest cases, claims sounding in defamation have been deemed a "personal injury." Indeed, this Court recognized as much nearly twenty years ago when it wrote in *In re Boyer*, 93 B.R. 313, 317 (Bankr. N.D.N.Y. 1988), in the context of a Section 1983 & 1985 claim: The term "personal injury tort" embraces a broad category of private or civil wrongs or injuries for which a court provides a remedy in the form of an action for damages, and includes damage to an individual's person and any invasion of personal rights, such as libel, slander and mental suffering, BLACK'S LAW DICTIONARY 707, 1335 (5th ed. 1979).

Accord Soukup v. Employers' Liab. Assur. Corp., 341 Mo. 614, 625, 108 S.W.2d 86, 90 (1937) citing 3 Words & Phrases, Fourth Series, p. 90 (workers' compensation case observing that "The words 'personal injuries' as defined by lexicographers, jurists and textwriters and by common acceptance, denote an injury either to the physical body of a person or to the reputation of a person, or to both.")

Simply put, "[t]here is no firm basis to support the proposition that libel and slander were considered to be other than personal injuries at common law." *McNeill v. Tarumianz*, 138 F. Supp. 713, 717 (D. Del. 1956). In support thereof, the Delaware district court quoted 1 Blackstone 6

The Thompson decision was generally met with approval by the Second Circuit Court of Appeals in *In re Conroy*, 237 F. 817 (2d Cir. 1916).

Commentaries 129, which classified rights of "personal security" to consist "in a person's legal and uninterrupted enjoyment of his life, his limbs, his body, his health and his reputation." *Id.* at 716 (further noting that the courts consider "rights of personal security" as synonymous with "personal injury"). 716.

The Supreme Court of Pennsylvania, in 1825, laid down the following common law history in the context of a claim involving a decedent: That a personal action dies with the person is an ancient and uncontested maxim. But the term "personal action," requires explanation. In a large sense, all actions except those for the recovery of real property, may be called personal. This definition would include contracts for the payment of money, which never were supposed to die with the person. The maxim must therefore be taken in a more

restricted meaning. It extends to all wrongs attended with actual force, whether they affect person or property; and to all injuries to the person only, though without force. Thus stood originally the common law, in which an alteration was made by the stat. 4. Ed. 3. c. 7, which gave an action to an executor for an injury done to the personal property of his testator in his life, which was extended to the executor of an executor by stat. 25, Ed. 3. And by the stat. 31, Ed. 3 c. 11, administrators have the same remedy as executors. These statutes received a liberal construction from the judges, but they do not extend to injuries to the person of the deceased, nor to his freehold. So that no action now lies, by an executor or administrator for an assault and battery of the deceased, or trespass *vi et armis*, on his land, or for slander; because it is merely a personal injury.

Lattimore v. Simmons, 13 Serg. & Rawle 183, 184-85 (Pa. 1825) (emphasis added). 17.

The Supreme Court of Wisconsin, in 1874, expounded upon this concept in a matter involving state bankruptcy law. It observed "A libel or a slander might deprive a man of 7

The Georgia Supreme Court in *Johnson v. Bradstreet Co.*, 87 Ga. 79, 81-82, 13 S.E. 250, 251 (1891) expounded upon this understanding: At common law, absolute personal rights were divided into personal security, personal liberty, and private property. The right of personal security was subdivided into protection to life, limb, body, health, and reputation. 3 Blackst. Com. 119. If the right to personal security includes reputation, then reputation is a part of the person, and an injury to the reputation is an injury to the person. Under the head of "security in person," Cooley includes the right to life, immunity from attacks and injuries, and to reputation. Cooley on Torts (2d ed.), 23, 24. See, also, Pollock on the Law of Torts, *7. Bouvier classes among absolute injuries to the person, batteries, injuries to health, slander, libel, and malicious prosecutions. 1 Bouv. L. Dic. (6th ed.) 636. "Person" is a broad term, and legally includes, not only the physical body and members, but also every bodily sense and personal attribute, among which is the reputation a man has acquired. Reputation is a sort of right to enjoy the good opinion of others, and is capable of growth and real existence, as an arm or a leg. If it is not to be classed as a personal right, where does it belong? No provision has been made for any middle class of injuries between those to person and those to property, and the great body of wrongs arrange themselves under the one head or the other. Whether viewed from the artificial arrangement of law writers, or the standpoint of common sense, an injury to reputation is an injury to person.

To harm the employment, destroy his credit, ruin his business, and greatly impair his estate; yet an action therefor would be an action for a personal injury, the effect of the wrong on the estate of the injured party being merely incidental." *Noonan v. Orton*, 34 Wis. 259, 263 (1874). That same year, the Supreme Court of Virginia recognized that an "action of slander" did "involve a claim for personal damages" and, as such, did not pass to the assignee in bankruptcy. *Dillard v. Collins*, 66 Va. 343, 345-47 (1874). 18.

Similarly, a claim by a wife for slander was deemed a "personal injury" claim such that, under the law at that time, her husband was required to join in the suit. See, e.g., *Smalley v. Anderson*, 18 Ky. 56 (1825) (in a claim for "personal injury", husband was required to join suit with wife in claim for slander accusing her of adultery); accord *Gibson v. Gibson*, 43 Wis. 23, 26-27 (1877); *Leonard v. Pope*, 27 Mich. 145, 146 (1873) (a claim for slander is "a personal grievance or cause of action"). The U.S. Court of Appeals for the Fifth Circuit agreed that "libel is a personal injury" and that "[a]t common law, libel and slander were classified as injuries to the person, or personal injuries. 3 Blackstone, 119; Cooley on Torts (2d Ed.) 23, 24; Bouvier, Law Dictionary, verbo 'Injury.'" *Times-Democrat Pub. Co. v. Mozee*, 136 F. 761, 763 (5th Cir. 1905). Although

the law now recognizes spousal independence, the nature of the action has not changed. 19.

The principle that slander and libel are personal injuries is one that was generally recognized, and, as seen above, it tended to be addressed in cases involving decedents. Blackstone, in his Commentaries (vol. 3, p. 302), stated the rule: "In actions merely personal, arising ex delicto, for wrongs actually done or committed by the defendant, as trespass, battery, and slander, the rule is that *actio personalis moritur cum persona*; and it shall never be revived either by or against the executors or other representatives." Thus, by statute, states such as Illinois, in overriding the common law to permit actions to survive, expressly carved out slander and libel as being personal injuries that would not survive. See *Holton v. Daly*, 106 Ill. 131, 139 (1882) quoting Ill. Rev. Stat. 1874, p. 126 ("actions to recover damages for an injury to the person, except slander and libel, shall also survive").

In contrast, a claim for wrongful death was not recognized at common law precisely because personal injury actions did not survive under the action *personalis moritur cum persona* universal maxim.

Statutes were, therefore, enacted to permit claims for wrongful death "compensatory of the damages sustained by the heirs or next of kin, who had, or are supposed to have had, a pecuniary interest in the life of the intestate." *Burns v. Grand R. & I. R. Co.*, 113 Ind. 169, 171, 15 N.E. 230, 231 (1888). Specifically, "[t]hese statutes, while they do not in terms revive the common law right of action for personal injury, nor make it survive the death of the injured person, create a new right in favor and for the benefit of the next of kin or heirs of the person whose death has been wrongfully caused." *Id.* 21.

Defendants mistakenly believes that the addition of a wrongful death implies that because only such a claim can arise from the death of a natural person's body, the term a personal injury must be construed similarly in context. Defendants misunderstands that a wrongful death claim is not a common law personal injury claim; thus it had to be specifically added. The addition of wrongful death claims does not, however, modify the common law understanding of a personal injury, which included libel and slander. 22.

The legislative history, therefore, shows that claims for wrongful death were added because they were not recognized at common law to be a personal injury. Libel and slander, on the other hand, were. The legislative record is otherwise silent as to the specific torts that made up a personal injury claim and therefore should be understood to include all such claims at common law, including slander and libel. Although Defendants worries that claims for emotional damages will create an exception that swallows the rule (Defendants's Brief at 10), it creates a straw-man argument, improperly lumping in claims that are not common law personal injury claims that happen to provide for emotional distress damages. Those claims are different, statutory causes of action; the only statutory claim included in Section 157(b)(2)(B) is the wrongful death claim.

Thus, when Congress enacted Section 157(b)(2)(B), it necessarily imported the common law meaning of a personal injury and, therefore, libel and slander claims. 8 ii. Plaintiffs is Entitled to Invoke Section 157(b)(2)(B) 23. Defendants seek to treat Plaintiffs, as a corporate person, differently under Section 157(b)(2)(B) than Plaintiffs. There is no reason for this. As libel is a personal injury tort, there is no basis to suggest a corporate person should be treated any differently than a natural person. Simply because it cannot suffer a battery does not mean it is foreclosed from all personal injury claims. As explained by the Georgia Supreme Court in *Johnson v. Bradstreet Co.*, 87 Ga. 79, 81-82, 13 S.E. 250, 251 (1891), an injury to reputation is an injury to person. Although a corporation may be unable to suffer a physical, bodily injury, it can suffer an injury to reputation. 24.

Defendants's citations are inapposite. The U.S. Supreme Court has not said that a corporation cannot suffer a personal injury; rather, *N.P.R. Co. v. Whalen*, 149 U.S. 157, 162-163 (1893), address actions in nuisance, which can only either affect life, health, senses, or property, and not reputation. Defendants's quote from *Roemer v. Commissioner of Internal Revenue*, 176 F.3d 693, 699 n. 4 (9th Cir. 1983), was a matter of pure dicta; the Ninth Circuit had no occasion to pass upon whether a corporation could, in fact, suffer a personal injury. Subsequent cases, such as *In re Lost Peninsula Marina Dev. Co., LLC*, 2010 U.S. Dist. LEXIS 78532 (E.D. Mich. 2010), wrongly rely upon such dicta. In fact, the Ninth Circuit's entire basis was *DiGiorgio Fruit Corp. v. American Federation of Labor*, which does not say a corporation cannot suffer a personal injury; it merely says that a corporation has no reputation in the personal sense, yet it has a business reputation. 215 Cal.App.2d 560, 571, 30 Cal.Rptr. 350, 356 (1963). The Second Circuit has specifically refrained from finding a dichotomy between a business reputation and the reputation of

Similarly, as invasions of personal rights, Claimants's false light invasion of privacy claims are a personal injury claims. See *Mercado v. Fuchs* (*In re Fuchs*), No. 05-36028-BJH-7, 2006 Bankr. LEXIS 4543, at *6-7 (U.S. Bankr. N.D. Tex. Jan. 26, 2006) (finding invasion of privacy claim to be a personal injury under Section 157(b)(2)(B)); see also *Bernstein v. Nat'l Broad. Co.*, 129 F. Supp. 817, 825 (D.D.C. 1955) (a The tort of invasion of privacy being a personal injury....)

of a natural person. See *Agar v. Commissioner*, 290 F.2d 283, 294 (2d Cir. 1961). However, the Eleventh Circuit specifically answered in the affirmative the question a [i]s damage to one's business reputation a personal injury? *Fabry v. Commissioner*, 223 F.3d 1261, 1270 (11th Cir. 2000).

In fact, the purpose of Section 157(b)(2)(B) was to properly address claims that should be heard by an Article III court. As noted above, such was prompted by the *Marathon* decision, a case where the sole litigants were corporate persons. Where a natural person would have a right to have a matter heard by an Article III court but a corporate person does not, such denial of equal protection

would be unlawfully violative of due process under the Fifth Amendment. See *Bolling v. Sharpe*, 347 U.S. 497 (1954) (holding equal protection claims implicate due process).

Even if corporate persons could be treated differently from natural persons for claims arising from the same transaction, it would be improper to abide Defendants's suggestion to have the Bankruptcy Court determine the corporate claim first, in order to then argue a preclusive effect against the natural person. This attempted end-run around a specifically mandated statutory provision, grounded in Constitutional rights, should not be condoned. This is not what the Supreme Court was considering in *Katchen v. Landy*, 382 U.S. 313 (1966); in *Katchen*, the determination involved a single party who submitted to equity jurisdiction. Plaintiffs has not taken action to deprive himself of his rights. Where Congress has acted to provide for access to Article III courts, it would run afoul of the intent of the law to make that access ephemeral.

Although Defendants at least has the decency to acknowledge that is its purpose, it would set an unconscionable precedent. Many natural persons conduct business through or have some relationship with a corporate person such that harms giving rise to their individual personal injury claims would also harm the corporate person. As a result, Defendants who would seek to deprive such natural persons of their right to be heard by an Article III court could simply involuntarily join or otherwise implead the related corporate person, have that matter heard first, and then attempt to preclude the natural person's claim on that basis.

The California Anti-SLAPP Law Does Not Apply

Defendants's motion is not about allowance of claims; it is about whether a state law procedural mechanism is to apply in a non-adversarial, contested matter. Although some federal courts permit the application of the California Anti-SLAPP law, Cal. Code Civ. P. Â§ 425.16, in civil cases arising from diversity jurisdiction, it has never been found applicable to a contested claim proceeding in bankruptcy court. The differences between the Federal Rules of Civil Procedure and the Federal Rules of Bankruptcy Procedure demonstrate that it makes little sense to do take such an unprecedented step.

The very nature and purpose of a proof of claim differs from a traditional complaint, rendering the California law impracticable. As this Court is aware: Correctly filed proof of claims â constitute prima facie evidence of the validity and amount of the claim To overcome this prima facie evidence, an objecting party must come forth with evidence which, if believed, would refute at least one of the allegations essential to the claim.â *Sherman v. Novak (In re Reilly)*, 245 B.R. 768, 773 (2d Cir. B.A.P. 2000). By producing â evidence equal in force to the prima facie case,â an objector can negate a claim's presumptive legal validity, thereby

In shifting the burden back to the claimant to â prove by a preponderance of the evidence that under applicable law the claim should be allowed.â *Creamer v. Motors Liquidation Co. GUC Trust (In re Motors Liquidation Co.)*, No. 12 Civ. 6074 (RJS), 2013 U.S. Dist. LEXIS 143957, 2013 WL 5549643, at *3 (S.D.N.Y. Sept. 26, 2013) (internal quotation marks omitted). If the objector does not â introduce[] evidence as to the invalidity of the claim or the excessiveness of its amount, the claimant need offer no further proof of the merits of the claim.â 4 *Collier on Bankruptcy* Â¶ 502.02 (Alan N. Resnick & Henry J. Sommer eds., 16th ed. 2014). In *re Residential Capital, LLC*, 519 B.R. 890, 907 (Bankr. S.D.N.Y. 2014). 30. In contrast, under Cal. Code Civ. P. Â§ 425.16(b)(1): A cause of action against a person arising from any act of that person in furtherance of the person's right of petition or free speech under the United States Constitution or the California Constitution in connection with a public issue shall be subject to a special motion to strike, unless the court determines that the plaintiff has established that there is a probability that the plaintiff will prevail on the claim.

California courts have established a two-step process: first, the defendant must establish the action arose from protected speech or petitioning activity, then — then the burden shifts to the plaintiff to establish a probability that the plaintiff will prevail on the claim, i.e., make a prima facie showing of facts which would, if proved at trial, support a judgment in plaintiff's favor.

In making its determination, the trial court is required to consider the pleadings and the supporting and opposing affidavits stating the facts upon which the liability or defense is based. — Dowling v. Zimmerman, 85 Cal. App. 4th 1400, 1417, 103 Cal. Rptr. 2d 174, 188 (2001) (internal citations and quotation marks omitted).

Further, [t]o establish a probability of prevailing, the plaintiff must demonstrate that the complaint is both legally sufficient and supported by a sufficient prima facie showing of facts to sustain a favorable judgment if the evidence submitted by the plaintiff is credited. For purposes of this inquiry, the trial court considers the pleadings and evidentiary submissions of both the plaintiff and the defendant (— § 425.16, subd. (b)(2)); though the court does not weigh the credibility or comparative probative strength of competing evidence, it should grant the motion if, as a matter of law, the defendant's — evidence supporting the motion defeats the plaintiff's — attempt to establish evidentiary support for the claim. In making this assessment it is the court's — responsibility to accept as true the evidence favorable to the plaintiff. The plaintiff need only establish that his or her claim has minimal merit to avoid being stricken as a SLAPP.

Soukup v. Law Offices of Herbert Hafif, 39 Cal. 4th 260, 291, 46 Cal. Rptr. 3d 638, 662-63, 139 P.3d 30, 50 (2006) (internal citations and quotation marks omitted).

This process makes little sense in a non-adversarial, claims objection proceeding. First, as noted, Claimants' — proofs of claim already enjoy a presumption of prima facie validity under Fed. R. Bankr. P. 3001(f) and Claimants' — submissions must be accepted as true. Thus, as a matter of law, Claimants will always prevail on a California anti-SLAPP motion, having the — minimal merit — which would support allowance of the claim. Second, once a party objects to a proof of claim and introduces evidence of invalidity, a claimant must prove his claim by a preponderance of the evidence, not merely a probability of prevailing. Defendants would require a bankruptcy court to make an unnecessary finding that a disallowed claim nevertheless had a probability of prevailing. The burden shifting framework does not work in a contested claim proceeding, even if it might work for an adversarial matter or in a case under the Rules of Civil Procedure.

Notably, even in diversity cases, the entirety of the California Anti-SLAPP law is not imported in its entirety. Unlike in California state courts, a denial of an Anti-SLAPP motion is not an appealable interlocutory order in Federal courts. See Hyan v. Hummer, 825 F.3d 1043 (9th Cir. 2016). Federal courts do not apply the timing requirements set forth in Section 425.16(f), which directly collides with the timeline allowed under Fed. R. Civ. P. 56. See Sarver v. Chartier, 813 F.3d 891 (9th Cir. 2016). Federal courts do not stay discovery upon the filing of an Anti-SLAPP motion, as otherwise directed by Section 425.16(g). See Metabolife Int'l, Inc. v. Wornick, 264 F.3d 832, 845 (9th Cir. 2001).

Even the very idea of the burden-shifting framework has been questioned by the Ninth Circuit. See Englert v. MacDonell, 551 F.3d 1099, 1102 (9th Cir. 2009) (reserving the issue with respect to a parallel Oregon statute). The D.C. Circuit directly confronted this issue in Abbas v. Foreign Policy Grp., LLC, 783 F.3d 1328, 1335 (2015). In Abbas, the D.C. Circuit directly rejected the idea that an analogous burden-shifting framework created a substantive, quasi-immunity from suit, because the law collided with Rules 12 and 56 as to how a showing is to be made, rendering it inapplicable pursuant to Shady Grove Orthopedic Associates, P.A. v. Allstate Insurance Co., 559 U.S. 393, 398-99, 130 S. Ct. 1431 (2010). See 783 F.3d at 1335.

Defendants attempts to distinguish Abbas by highlighting the non-mandatory nature of applying Rules 12(b)(6) and 56, suggesting that collision is avoided if those rules are not applied. Defendants's Brief at 15-16. First, it bears observing that Defendants, in its objections to the claims, did move to apply Rule 12(b)(6), rendering its own argument moot. Thus, where Â§ 425.16 does conflict with Rule 7012, its application would directly collide with this Court's authority to â direct that one or more of the other rules in Part VII shall apply.â Fed. R. Bankr. P. 9014(c). Second, although Defendants argues that the Court can â otherwise directâ Rule 7056 not apply per Rule 9014, it provides no reason why the normal rules should be avoided here; Claimants located but one case where a bankruptcy court made such direction to permit the parties to â flesh out the recordâ, there on a motion to employ, not a claims objection. See *In re Rusty Jones, Inc.*, 109 B.R. 838, 845 (Bankr. N.D. Ill. 1989). Fleshing out a record would similarly be reason not to apply Â§ 425.16 where

Defendants has otherwise obtained a briefing schedule in order for it to take discovery. See Dkt. No. 703. Essentially, the only reason to â otherwise directâ Rule 7056 not apply is because it collides with Â§ 425.16. Third, to not apply certain rules simply because Claimants are California citizens would deny such citizens equal protection in a manner to be so violative of due process that it is an offense to the Fifth Amendment. See *Shapiro v. Thompson*, 394 U.S. 618, 642, 89 S. Ct. 1322, 1335 (1969).

Moreover, it makes little sense to import the California procedure where Fed. R. Bankr. P. 3007 permits parties in interest other than the Defendants to object to a claim. It could well be impracticable where a Defendants does not believe protected speech was involved, but a third party does. It is not equitable for one class of objector (a Defendants) to potentially enjoy the benefits of the California procedure (attorneys's fees) and not others (other creditors).

Contrary to the assertion of Defendants, the procedures of Â§ 425.16 are not â bound upâ with the law of libel, even to the extent Justice Stevens's concurrence in *Shady Grove Orthopedic Assocs., P.A. v. Allstate Ins. Co.*, 599 U.S. 393, 419-410 (2010), is controlling. First, Defendants fails to identify what the substantive law is that Section 425.16 is bound up with. The California Anti-SLAPP law is not limited to the law of libel; it also applies to other state law claims. See, e.g., *State Farm Mut. Auto. Ins. Co. v. Lee*, 193 Cal. App. 4th 34, 122 Cal. Rptr. 3D 183 (2011) (application to abuse of process and unfair business practice claims); *Jarrow Formulas, Inc. v. LaMarche*, 31 Cal. 4th 728, 3 Cal. Rptr. 3d 636, 74 P.3d 737 (2003) (application to malicious prosecution claims); *Fremont Reorganizing Corp. v. Faigin*, 198 Cal. App. 4th 1153, 131 Cal. Rptr. 3d 478 (2011) (application to breach of confidence, breach of fiduciary duty, equitable indemnity, and violation of Cal. R. Prof. Conduct 3-310(C)); *Peregrine Funding, Inc. v. Sheppard Mullin Richter & Hampton LLP*, 133 Cal.App.4th 658, 674â675, 35 Cal. Rptr. 3D 31 (2005) (application to legal malpractice and breach of fiduciary duty claims). Section 425.16 is not analogous to a bond posting requirement, statute of limitations, evidentiary rule, or verdict capping identified by Justice Stevens, all of which have a substantive quality. See *Shady Grove*, 599 U.S. at 419-410. Here, Defendants seeks to employ a burden shifting framework that could appear at but one discrete stage of a diversity case and has no role in a claim objection; this is not even, then, an example of a â state-imposed burden[] of proofâ, which would go to the ultimate outcome. *Id.* at 410 n. 4. There is no question that Claimants have the ultimate burden of proof, with or without the Anti-SLAPP motion. Thus, as it is not sufficiently bound up with any particular substantive law, it is not applicable in this matter. 9

Claims in a bankruptcy case are distinguishable from adversarial matters, especially those brought in district court on the basis of diversity jurisdiction. Claimants did not choose this forum; Defendants did by filing its petition. In doing so, it effectively stripped Claimants of their usual litigation rights. As Defendants says, â what is good for the goose is good for the ganderâ. Defendants's Brief at 14. It would be inequitable to allow Defendants the benefit of a normal civil case, such as the use of Section 425.16, while simultaneously denying Claimants the benefits of such a case, by having deprived them of their chosen forum. C.

This Matter Should Be Heard by the District Court With Plaintiff's Case Supported By DOJ

Moving forward, this matter should proceed before the district court. Defendants incorrectly asserts that *Exec. Bens. Ins. Agency v. Arkison*, 134 S. Ct. 2165 (2014) commands that this Court first determine the case; rather, it held that having summary judgment first heard by the bankruptcy court, to be followed by de novo review by the district court, was permissible under 28 U.S.C. Â§ 157(c). See *Messer v. Magee (In re FKF 3, LLC)*, No. 13-CV-3601 (KMK), 2016 U.S. Dist. LEXIS 117258, at *52 n.11 (S.D.N.Y. Aug. 30, 2016). Section 157(c)(1) says that a bankruptcy court â mayâ hear a non-core proceeding, not that it must.

The standard as to whether the bankruptcy court should hear the non-core proceeding in the first instance under Section 157(c)(1) is not well articulated. Guidance from cases under Section 157(d), regarding withdrawal, however, may be informative. In such cases, the considerations are â (1) whether the case is likely to reach trial; (2) whether protracted discovery 9

Although Defendants noted the availability of fees under Â§ 425.16, such provision is secondary to the burden-shifting framework. If the Bankruptcy Court does not perform the mechanism to determine whether or not a probability of success occurs, it would never reach the issue of fees. Section 425.16 does not create a substantive right to fees in all libel cases; only those cases where a defendant is successful on a motion to strike.

with court oversight will be required; and (3) whether the bankruptcy court has familiarity with the issues presented.â In *re Times Circle East, Inc.*, 1995 U.S. Dist. LEXIS 11642, 1995 WL 489551, at *3 (S.D.N.Y. Aug. 15, 1995). All three factors warrant the matter being heard by the District Court in the first instance.

This case is likely to reach trial. Claimants have properly asserted multiple false and defamatory statements as libelous. Because of the defenses asserted by Defendants, it is more probable than not that multiple statements will require factual determinations beyond otherwise being readily apparent on their face. Defendants has asserted a defense of lack of actual malice; such will require probing and evidence into its research, editorial, and publication process. Defendants has asserted a defense under Section 230 of the Communications Decency Act; such will require probing and evidence into its business practices, sources, and publication processes. Neither do Claimants have any confidence that this matter will reach settlement; as noted above, even after having filed a bankruptcy petition arising from publication malfeasance, Defendants continued to defame Claimants.

Moreover, this non-core proceeding will likely require a jury trial to determine the claimâ s value. As having filed personal injury tort claim, Claimants are entitled to and claim the right to trial by jury. See 28 U.S.C. Â§ 1411(a). The Second Circuit has found that jury trials in non-core proceedings are likely prohibited â due to the district courtâ s de novo review of such proceedings.â In *re Orion Pictures Corp.*, 4 F.3d 1095, 1101 (2d Cir. 1993).

Protracted discovery with court oversight will be required. Among other matters, without limitation: Claimants will seek depositions from Defendants. Claimants will require discovery of the identities of the Gawker authors and campaign financiers and will seek to depose them.

Claimants will seek discovery from Defendants as to its business practices, including editorial and publication decisions and social media cross-promotion, as well as the source code relative to the Kinja and website platforms. Claimants will require detailed discovery into the readership and extent of circulation. Claimants anticipate significant litigation over several of these items.

A Bankruptcy Court is unfamiliar with the issues presented. A LEXIS search for cases involving "actual malice" or "section 230", involving "libel", "slander", or "defamation", yielded only six decisions in three cases in this Court. This is not the typical claim arising in a Chapter 11 proceeding. Such cases and issues arise with far more frequency before the District Court.

Because all of the factors favor the District Court, the Bankruptcy Court should not hear these non-core proceedings. III.

As set forth above, the California Anti-SLAPP law is not applicable to a contested matter under Fed. R. Bankr. P. 3007, especially as it relates to the allowance of claims. The state statute conflicts with the Federal procedures and otherwise is unworkable where a proof of claim is already prima facie evidence of a possibility of prevailing. Notwithstanding, Claimants filed their proofs of claims knowing they would ultimately prevail, whether or not the California Anti-SLAPP law applies.

The claims asserted by Claimants are personal injury tort claims that should be heard by the District Court for all further proceedings. Congress must be deemed to have understood the meaning of the term "personal injury" when it legislated, a meaning that, for centuries, has included causes of action sounding in libel and slander, as well as false light invasion of privacy. Defendants have failed to demonstrate that any different meaning was intended.

The issues raised by Defendants show a determined intent to attempt to avoid facing liability for the multiple calamities it heaped upon Claimants. Claimants are entitled to be heard and to vindicate their claims.

INTENTIONAL INTERFERENCE WITH CONTRACTUAL RELATIONS CAUSE OF ACTION NOTES

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

Defendants knew of the above described contractual relationship existing between the Plaintiffs and COMPANY B and the United States Department of Energy, in that the grant was made public record and, at the request of representatives of the Venture Capital group of the Defendants, the Plaintiffs believing that the request for information was as to providing additional funding for the project, did, in fact, submit complete information regarding the subject of the grant to Defendants' agents upon their request.

Defendants, who had, and have, personal, stock-ownership, revolving-door career and business relationships with executive decision-makers at the United States Department of Energy and other Federal and State officials, lobbied and service-compensated those executive decision-makers to cancel, interfere and otherwise disrupt the grant in favor of the Plaintiffs, with the intention of terminating the funding in favor of the Plaintiffs and COMPANY B and applying the information they pirated from the Plaintiffs, for their own benefit as well as terminating the Plaintiffs' competing efforts, which third party industry analysts felt could obsolete Defendants' products via superior technology.

Individuals approached Plaintiffs offering to "help" the Plaintiffs get their ventures funded or managed. Those individuals were later found to have been working for Kleiner Perkin's, the founding investor and current share-holder of Defendants. The Plaintiffs discovered that those "helpful" individuals were helping to sabotage development efforts and pass intelligence to Defendants for its own use and applications.

Accordingly, Defendants was successful in its efforts and, in or about August of 2009, the grant and other funding programs in favor of the Plaintiffs, was summarily canceled and re-directed to Defendants and their holdings.

Commencing in or about 2008, Defendants commenced to take credit for advancement in its own energy storage and internet media technology, as based on the information it had pirated from the Plaintiffs.

The interference of Defendants, with the relationship of the Plaintiffs, was intentional, continues to today, and constitutes an unfair business practice in violation of Business and Professions code section 17200.

As a proximate result of the conduct of the Defendants, and severance and termination of the grant to the Plaintiffs, the Plaintiffs have suffered damages including financial damage, damage to their reputation and loss of critical intellectual property.

The aforementioned acts of the Defendants, were willful, fraudulent, oppressive and malicious. The Plaintiffs is therefore entitled to punitive damages.

INTENTIONAL INTERFERENCE WITH PROSPECTIVE ECONOMIC ADVANTAGE CAUSE OF ACTION NOTES

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

When the Plaintiffs discovered that their fundings from the United States Department of Energy had been terminated, de-funded and re-routed to Defendants, by Defendants. The Plaintiffs informed other members of the energy and automotive technology industry and the U.S. Congress of the facts of Defendants behavior and specifically the behavior that gave rise to termination of the grant.

Defendants became aware that the Plaintiffs were intent on telling the truth about these facts, about true ownership of the intellectual property relied on by Defendants in its own vehicle, energy and internet media technology and about Defendants theft of this property.

In order to put a stop to the Plaintiffs and in an effort to discredit Plaintiffs, divest Plaintiffs of contacts in the industry and also of financial backing, Defendants enlisted the services of the Defendants, YouTube and Gawker and also Defendants own wide array of media and branding manipulation tools which are service offerings of Defendants. The Defendant produced attack material is reposted, impression accelerated, click-farm fertilized and Streisand array reposted by Defendants massive character assassination technology via servers algorithms and technical internet manipulation daily as recently as yesterday. Defendants also embed the article in job hiring databases on Axciom, Palantir, Taleo and other databases used by all hiring and recruiting services in order to prevent Plaintiffs from ever receiving income for W2 or 1099 work ever again.

Under the directions of Defendants, Gawker published a contrived â hatchet jobâ article describing the Plaintiffs in horrific descriptors. The article is reposted, impression accelerated, click-farm fertilized and Streisand array reposted by Defendants massive character assassination technology via servers algorithms and technical internet manipulation daily as recently as yesterday. Defendants also embed the article in job hiring databases on Axciom, Palantir, Taleo and other databases used by all hiring and recruiting services in order to prevent Plaintiffs from ever receiving income for W2 or 1099 work ever again. Defendants own staff then posted thousands of fake comments, below each attack item, under fake names, designed to make it appear as if a broad consensus of the public agreed with the defamation messages by Defendants. Almost all of the fake comments were created by a

handful of Defendants own staff pretending to be a variety of outside voices. Defendants replicated various versions of these attack items across all of their different brands and facade front publications and added additional fake comments to each on a regular basis.

Additionally, Defendants YouTube posted a video which depicted the Plaintiffs as a cartoon character who attempts to engage in unethical behavior. The video employs Plaintiffs personal name and personal information. The article is reposted, impression accelerated, click-farm fertilized and Streisand array reposted by Defendants massive character assassination technology via servers algorithms and technical internet manipulation daily as recently as yesterday. Defendants also embed the article in job hiring databases on Axcion, Palantir, Taleo and other databases used by all hiring and recruiting services in order to prevent Plaintiffs from ever receiving income for W2 or 1099 work ever again. Defendants own staff then posted thousands of fake comments, below each attack item, under fake names, designed to make it appear as if a broad consensus of the public agreed with the defamation messages by Defendants. Almost all of the fake comments were created by a handful of Defendants own staff pretending to be a variety of outside voices. Defendants replicated various versions of these attack items across all of their different brands and facade front publications and added additional fake comments to each on a regular basis.

Defendants has paid tens of millions of dollars to Gawker Media and has a business and political relationship with Gawker Media according to financial filings, other lawsuit evidence, federal investigators and ex-employees.

Also as intended by Defendants, this damage, especially because the false representations become immediately apparent to anyone conducting an internet search for the Plaintiffs, have caused investors to shy away from the Plaintiffs, causing the Plaintiffs further difficulty in obtaining funding.

Defendants has also placed on human resources and and job hiring databases negative and damaging red flags about the Plaintiffs, relative to the Gawker and Defendants attacks. These postings were intended by Defendants to prevent the Plaintiffs, not only from working for himself, but also from working for other, noteworthy individuals of good repute.

Additionally, Defendants representatives sent a copy of the Gawker attack article to an employer of the Plaintiffs via their human resources office and asked this employer, "You don't want him working for you with this kind of article out there, do you?" This resulted in the Plaintiffs immediate termination because of that article. Plaintiffs has recovered documents between Defendants showing the preplanned and premeditated deployment of this attack. As documented in one of the Hulk Hogan cases against Defendants associates: *"As evidence, the lawsuit points to a Gawker article by its founder, Nick Denton, that predicted Mr. Bollea's real secret would be revealed it was posted soon before The Enquirer report and a 14-minute gap between the publication of the article and a Gawker editor, Albert J. Daulerio, tweeting about it. Based upon the timing and content of Daulerio's tweet, Daulerio was aware, in advance, of The Enquirer's plans to publish the court-protected confidential transcript, the lawsuit argues..."* Plaintiffs in this case also have the same form of evidence from the same parties.

As a proximate result of the conduct of the Defendants, the Plaintiffs and COMPANY B have suffered severe financial damage and, accordingly, loss of their good will and reputation.

Plaintiffs are informed by investigators and Defendants' own former staff that Defendants planned an effort to "take him down" in retribution for effectively competing with Defendants and for co-operating with law enforcement and regulatory investigations of Defendants.

The aforementioned acts of the Defendants were willful, fraudulent, oppressive and malicious. The Plaintiffs is therefore entitled to punitive damages.

CYBER-STALKING CAUSE OF ACTION

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

By hiring and/or making an arrangement with associated tabloids to publish an article replete with false and misleading statements disparaging the Plaintiffs, in the guise of publishing opinion, the Defendants Defendants intended to harass the Plaintiffs and did in fact harass the Plaintiffs.

By refusing to remove the offending publication and, in fact, assigning it a value associated with â truthâ , â factualityâ and a position in its web browser that came up and still comes up the first and most prominent link pursuant to any search for the Plaintiffs and maintaining this link for the past 5 years as globally marketed, public, published, permanent, un-editable and unmovable, Defendants intended, and continues to intend to harass the Plaintiffs.

By doing the things described in paragraphs above, Defendants, did and does continue to intend to cause the Plaintiffs substantial emotional and economic damages.

The Plaintiffs, commencing in or about their discovery of the post and the link, has experienced and continues to experience substantial economic damages.

Defendants engaged in the pattern of conduct described above with the intent to place the Plaintiffs in reasonable fear for their safety or in reckless disregard for the safety of the Plaintiffs.

The Plaintiffs admit here that Plaintiffs knew of a number of Bay Area technologists including Gary D. Conley, Rajeev Motwani who also had strange run-ins with Defendants and who subsequently suffered strange terminations per investigators and media who continue, at the request of the families and friends of those individuals, and others, to examine those cases. This has caused concern and stress for Plaintiffs. While Defendants did not necessarily have the intent to do physical harm to the Plaintiffs, by arranging for publication of the subject article, ensuring the subject article could not be moved or altered and would be certain to appear first and permanently as the result of any search for the Plaintiffs, intended to do significant damage to Plaintiffs financial interests in retaliation for their testimony at the proceedings described above and also intended to ensure the Plaintiffs would have no future as a competitor in the industry of technology populated by the Plaintiffs and by the Defendants.

Defendants chose to cheat rather than compete and decided, as a whole to plan, operate and deploy â hit jobsâ , defamation attacks, media hatchet jobs, character assassinations, venture capitol black-lists, technology hiring no-poaching blacklists, public officials influence buying and other illicit tactics against Plaintiffs, public officials, journalists, ex-employees, political candidates and others, as retribution, vengeance and vendetta tactics.

The results of any search for the Plaintiffs on Defendants search engine are attached hereto in the Exhibits and incorporated herein by reference. These same results have remained consistently in place and unmovable and un-editable since the first attacks by Defendants.

The Plaintiffs did contact Defendants with written requests to remove the offending content. [See, Correspondence, a true and correct copy of which is attached hereto as Exhibits and incorporated herein by reference.] In response, Defendants consistently stated it has no control over the results of any search on its search engine or the operation of its technology or its algorithm and, accordingly, refused to remove the results or cease the harassment.

Defendants continues to refuse to allow any member of the public to search for the Plaintiffs, without locating results that falsely identify the Plaintiffs in a negative and damaging narrative contrived for the sole intended purpose of Plaintiffs financial and social destruction.

As so aptly stated by Hulk Hogan's lawyers in their own suit against associates of the Defendants: The Defendants *chose to play God.*

FRAUD CAUSE OF ACTION

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

As above, in response to the request of the Plaintiffs regarding removal of the Gawker article of the Defendant stated that has no control over the results of any search on its search engine and no control over the results of its algorithms, refused to and continues to refuse to allow any member of the public to search for the Plaintiffs, without publishing results that falsely attack Plaintiffs

The Defendant made this statement with the intent to induce the Plaintiffs Company A to rely on it. The Plaintiffs continued to rely on the statement and to believe that the Defendant has not power or authority to manipulate the results of searches conducted on its search engine until in or about mid 2015 when it became clear as the result of the litigation commenced in Europe by The European Commission, that Defendant does in fact have such ability and does, in fact, exercise this ability regularly to manipulate and manage any of the results of any search on its engine.

Defendants made the following representation(s) to the Plaintiffs: They stated that Defendants had no control over the public experience of its products, page ranking and link presentation and that all results were arbitrary and a matter of luck.

The representations made by the defendant were in fact false. The true facts are that Defendants owners and executives can freely, consciously and manually rig, manipulate, modify, mood emphasize, re-rank, hide, adjust psychological adjacency perceptions of above-and-below text, delete or otherwise affect the local, regional, national and global perceptions of the public overall, or any market segment, or demographic, at will, in precise, controlled and monitored manipulations and that Defendants has even sold these manipulations-as-a-service to private clients.

When the defendant made these representations, he/she/it knew them to be false and made these representations with the intention to deceive and defraud the Plaintiffs and to induce the Plaintiffs to act in reliance on these representations in the manner hereafter alleged, or with the expectation that the Plaintiffs would so act.

The Plaintiffs, at the time these representations were made by the defendant and at the time the Plaintiffs took the actions herein alleged, was ignorant of the falsity of the defendant's representations and believed them to be true. In reliance on these representations, the Plaintiffs was induced to and did delay their attempts to have Defendants cease their abuse of Plaintiffs by technical means. Had the Plaintiffs known the actual facts, he/she would not have taken such action. The Plaintiffs reliance on the defendant's representations was justified because Defendants stated that they represented government interests and because FTC and SEC investigation manipulations, by Defendants, had not yet been fully exposed in the news media.

As a proximate result of the fraudulent conduct of the defendant(s) as herein alleged, the Plaintiffs was induced to expend hundreds of hours of their/her time and energy in an attempt to derive a profit from their ventures which were covertly under attack by defendant(s) but has received no profit or other compensation for their/her time and energy], by reason of which the Plaintiffs has

been damaged in the sum of at least two billion dollars based on the minimum reported amounts by which Defendants profited at Plaintiffs expense and the paths of direction which Plaintiffs were steered to by Defendants fraudulent misrepresentations.

The aforementioned conduct of the defendant(s) was an intentional misrepresentation, deceit, or concealment of a material fact known to the defendant(s) with the intention on the part of the defendant(s) of thereby depriving the Plaintiffs of property or legal rights or otherwise causing injury, and was despicable conduct that subjected the Plaintiffs to a cruel and unjust hardship in conscious disregard of the Plaintiffs rights, so as to justify an award of exemplary and punitive damages.

INVASION OF PRIVACY CAUSE OF ACTION

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

The Defendant, first by arranging for and allowing/posting the gawker article, then by coding a link to the article that permanently placed the article at the top of any search results for the Plaintiffs, Company A, has invaded the inalienable privacy rights of the Plaintiffs, Company A as protected by Article I section 1 of the Constitution of the State of California and violated the human right known as â the right to be forgottenâ , now overtly supported in other nations.

The intrusion commenced with the first attack and continues to this day, is significant and remains unjustified by any legitimate countervailing interest of the Defendant.

For five years, when any member of the public searches on the Defendant search engine holdings, for the Plaintiffs, Company A, the first link to pop up refers to the Plaintiffs, Company A via Defendants severs and postings which are locked in position on the internet. A situation which could only possibly occur if Defendants and their partner Google were maliciously rigging the internet results and processes.

The pervasiveness and longevity of this link plus its placement at the very top of any search result has resulted in a significant, albeit intentional interference with the right of the Plaintiffs Company A to engage in and conduct personal and business activities, to enjoy and defend life and liberty, acquiring possessing and protecting property and pursuing and obtaining safety, happiness and privacy.

The Gizmodo/Gawker/Jalopnik Nick Denton Tabloid attacks on Plaintiffs were and remain false. Even in the event the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid article might have at one time garnered protection by the First Amendment as opinion regarding a public controversy and about a non-public figure, no further controversy exists or even could.

Five years have passed and, despite the lack of current content of controversy, the Plaintiffs, Company A remains saddled with a personal, permanent and immovable reference on the internet that characterizes Plaintiffs in horrific character assassination efforts.

The Plaintiffs Company A has done the best he could in these years to move on with new projects and new investors. He has made every effort to start anew and has been precluded from doing so by the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid attacks hired by Defendants.

Maintenance of the original attack postings for five years is offensive and objectionable to the Plaintiffs Company A and certainly would be to a reasonable person of ordinary sensibilities in that the original posting is false and defamatory and was intentionally arranged for by Defendant so as to do significant damage to the personal and professional reputation of the Plaintiffs, Company A, because it has accomplished this damage, because there is no manner other than at the Defendant Defendants hand by which the link can be altered or removed or the search results edited or limited and because there exists no reason that the Plaintiffs Company A should not be allowed to enjoy a right to move on with is life independent of a label that had no basis in truth and reality in the first place.

The facts regarding the character of the Plaintiffs, Company A, included in the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid articles are certainly no longer of any legitimate public concern nor are they newsworthy nor are they tied to any current controversy or dialogue.

IN FACT, THE Plaintiffs, can truly no longer be considered a public figure or even a semi-public figure as the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid article has fairly successfully put him out of business and kept him out of business for the past five or more years.

As a proximate result of the above disclosure, Plaintiffs lost investors, contracts, was scorned and abandoned by their/her friends and family, exposed to contempt and ridicule, and suffered loss of reputation and standing in the community, all of which caused them/him/her humiliation, embarrassment, hurt feelings, mental anguish, and suffering], all to their/her general damage in an amount according to proof.

As a further proximate result of the above-mentioned disclosure, Plaintiffs suffered special damages to the brand, financing, reputation and market timeframe opportunities for their/her business, in that they lost funding, market share, federal contracts and other income, to their special damage in an amount according to proof.

In making the disclosure described above, defendant was guilty of oppression, fraud, or malice, in that defendant made the disclosure with (the intent to vex, injure, or annoy Plaintiffs *or* a willful and conscious disregard of Plaintiffs rights. Plaintiffs therefore also seeks an award of punitive damages.

Defendant has threatened to continue disclosing the above information. Unless and until enjoined and restrained by order of this court, defendantâs continued publication will cause Plaintiffs great and irreparable injury in that Plaintiffs will suffer continued humiliation, embarrassment, hurt feelings, and mental anguish. Plaintiffs has no adequate remedy at law for the injuries being suffered in that a judgment for monetary damages will not end the invasion of Plaintiffs privacy.

UNFAIR COMPETITION CAUSE OF ACTION

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

The Plaintiffs brings this action on their own behalf and on behalf of all persons similarly situated. The class that the Plaintiffs Company A represents is composed of all persons who, at any time since the date four years before the filing of this complaint,

sought to have offensive, irrelevant and outdated material posted to the internet and available through a search on the Defendant search engine corrected, removed or re-ranked and have been informed by the Defendant that the Defendant does not have the ability to do so and that Defendants falsely states this assertion in Defendants published policy.

The persons in the class are so numerous, an estimated 39% of the population of the United States of America, that the joinder of all such persons is impracticable and that the disposition of their claims in a class action is a benefit to the parties and to the court.

There is a well-defined community of interest in the questions of law and fact involved affecting the parties to be represented in that each member of the class is or has been in the same factual circumstances, hereinafter alleged, as the Plaintiffs . Proof of a common or single state of facts will establish the right of each member of the class to recover. The claims of the Plaintiffs are typical of those of the class and the Plaintiffs will fairly and adequately represent the interests of the class.

There is no plain, speedy, or adequate remedy other than by maintenance of this class action because the Plaintiffs is informed and believes that each class member is entitled to restitution of a relatively small amount of money, amounting at most to \$5,000.00 each, making it economically infeasible to pursue remedies other than a class action. Consequently, there would be a failure of justice but for the maintenance of the present class action.

The Defendant is a business incorporated in the State of California and at all times herein mentioned owned and operated a its search engine and its ancillary commercial enterprises from its headquarters in Mountain View California.

GAWKER/GIZMODO/JALOPNIK, a well-known internet libel and slander processing tabloid service published media about the Plaintiffs. The media falsely, maliciously and without regard for the truth, labeled the Plaintiffs, in a malicious negative light.

Any search on the Defendant's search engine for "Company A" resulted and to this day still results in a display of the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid article with the Plaintiffs described as a horrible person.

Publication of the article by Gizmodo/Gawker/Jalopnik Nick Denton Tabloid and the linking by GOOGLE caused the Plaintiffs immediate and irreparable harm to their reputation, to their business interests and to their personal life. Financial records acquired by Plaintiff's and law enforcement reveal millions of dollars of payments transacted between Defendants and the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid hit job publishing empire to pay for these character assassination revenge vendetta services.

Some five years have passed and the Plaintiffs, Company A, continues to suffer damage to their reputation to their business interests and to their personal life as the result of the publication by Gizmodo/Gawker/Jalopnik Nick Denton Tabloid and GOOGLE's rigged link to it.

The Plaintiffs directed a written request to the Defendants to unlink the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid publication to any search for their name or to delete the offending article.

The Defendant, responded by stating that it had no ability or legal obligation to do so as the request didn't fall within its own policies for removal.

The position of the Defendant is illegal, false and unfair.

The position of the Defendant is illegal as it infringes on the rights of individuals as protected by the Constitution of the State of California which protects the rights and freedoms of individuals to: "All people are by nature free and independent and have inalienable rights. Among these are enjoying and defending life and liberty, acquiring, possessing, and protecting property, and pursuing and obtaining safety, happiness, and privacy." per the State Constitution.

The position of the Defendant is unfair as it deprives individuals of rights protected by the Constitution of the State of California which protects the rights and freedoms of individuals to: "All people are by nature free and independent and have inalienable rights. Among these are enjoying and defending life and liberty, acquiring, possessing, and protecting property, and pursuing and obtaining safety, happiness, and privacy."

The position of the Defendant, is false because, as a processor of personal information and a controller of that information, the Defendant also possesses the technical, logistical and government official manipulation power and ability to delete, re-rank and mood manipulate any information obtained as the result of a search on its search engine.

As a direct, proximate, and foreseeable result of the Defendant's wrongful conduct, as alleged above, the Plaintiffs and millions of others other members of the Plaintiffs class, who are unknown to the Plaintiffs but can be identified through inspection of the Defendant's records reflecting requests for removal it has already received and by other means, have been subjected to unlawful and unwanted publication of inaccurate, inadequate, irrelevant, false, excessive, malicious and defamatory internet postings about themselves and as a result of the Defendant's present policies, have thereby been deprived of their right to privacy and the right to control information published about them as this control now apparently is vested in the Defendant and not in and of themselves.

The Plaintiffs is entitled to relief, including full restitution for the unfair practices of the Defendant as these have damaged their reputation and their business prospects and deletion or de-ranking of any article naming Plaintiffs in horrific character assassination efforts. as inaccurate and currently irrelevant.

The Defendant, has failed and refused to accede to the Plaintiffs's request for a removal of the offending article or for any de-ranking or separation of the article from a search for their name. The Plaintiffs is informed and believes and thereon alleges that the Defendant has likewise failed and refused, and in the future will fail and refuse, to accede to the requests of other individuals requests for removal, de-ranking or the separation of search results from a simple search for their name.

The Defendant's acts hereinabove alleged are acts of unfair competition within the meaning of [Business and Professions Code Section 17203](#). The Plaintiffs is informed and believes that the Defendant will continue to do those acts unless the court orders the Defendant to cease and desist.

The Plaintiffs has incurred and, during the pendency of this action, will incur expenses for attorney's fees and costs herein. Such attorney's fees and costs are necessary for the prosecution of this action and will result in a benefit to each of the members of the class. The sum of \$500,000.00 is a reasonable amount for attorney's fees herein.

THEFT OF INTELLECTUAL PROPERTY CAUSE OF ACTION

The Plaintiffs hereby incorporate by reference the allegations set forth in all paragraphs inclusive as though fully set forth herein.

Plaintiffs venture fund has founded, funded and launched multiple business ventures based on novel new technology inventions. In the majority of the cases, Defendants engaged in industrial espionage of Plaintiffs new ventures, including using agents to solicit Plaintiffs for information under the guise of "possibly investing", and then copied and exploited those ventures for substantial profit while running attacks on Plaintiffs venture in order to blockade any attempt at competition. Defendants engaged in systematic venture capitol black-listing, funding cartels, the hiring of attack-media hatchet job bloggers, internet search rigging and numerous other dirty tricks campaigns in order to steal technology and business ideas. SEC, U.S. Senate Investigators, broadcast news journalists, other federal investigators and records from other lawsuits have provided testimony that Defendants have paid Gawker Media "tens of millions of dollars" for "special services". Of millions of publications in the world, only Gawker Media engaged in the media attacks against Plaintiffs and only the Defendants derived the core benefits of those attacks. A list of the Plaintiffs business ventures interdicted and copied by Defendants includes the following. U.S. Patent Office records, NDAs, email leaks, contracts and federal recordings show that Plaintiff's built and marketed the first versions of Google and YouTube. Defendants knew Plaintiffs and copied their work and formed their versions of Google and YouTube after seeing Plaintiffs technology and copying it.

Kleiner Perkins is Defendants main investor; Suspected by federal investigators to have had a hand in the attacks on Plaintiffs).

Defendants did have their agents, investors, executives and staff contact Plaintiffs under the guise of "considering an investment" in order to induce Plaintiffs to disclose trade secrets under false promises of confidentiality

The New York Times newspaper and digital publications group published an investigative article entitled: **"How Larry Page's Obsession Became Defendants Business"** on January 22, 2016 by [CONOR DOUGHERTY](#). This article describes the manner in which Defendants founder, Larry Page, seeks to steal ideas, for Defendants, from young entrepreneurs and inventors, much as he appears to have done to Plaintiffs. The article discloses the covert manners in which Defendants harvest intellectual property without revealing their true identities or actual intentions.

Hundreds of reporters, clients and members of the public have commented that: "Defendants seems to copy everything you come up with" to Plaintiffs. In one specific instance, a television show entitled the Silicon Valley Business Report did a broadcast report demonstrating how Plaintiffs company appeared to have been nearly 100% copied by Defendants's YouTube. In another instance, the globally broadcast TV Network E! Entertainment Network produced a network TV segment about Plaintiffs creation: "Scott Glass" which was later copied by Defendants as: "Defendants Glass" with nearly verbatim features, appearance.

CBS News staff, including Bob Simon of 60 Minutes CBS News, did inform Creditors that Defendants did attack, interfere with the business of, defraud, cyber-stalk and engage in RICO statute violations of Creditors as exemplified in the FBI Solyndra, Cleantech and Obama Administration campaign financing quid-pro-quo investigations since 2007.

Federal corruption hearings and court trials in Washington DC have proven these facts and ruled that Creditors were in fact subjected to reprisal, vendetta and retribution actions financed and directed in part by Defendants.

Former staff of a company called KiOR have whistle-blown as to the veracity of facts about Defendants and recent CIA/FBI and Russian Hacks of Khosla have confirmed the veracity of damages by Defendants against Creditors.

Defendants have sent numerous proxies to spy on and interfere with Creditors under the guise of "helping" Creditors or "considering an investment in Creditors".

Creditors report to the FBI and have privileged access to Federal executive officials such that law enforcement knowledge is shared.

House Ethics investigators and San Jose Mercury News investigators have provided additional evidence and verifying data.

Tens of billions of dollars of profits were acquired by Defendants while infringing Plaintiffs technologies, and Defendants sought to damage and delay Plaintiffs ability to seek recovery.

Defendants maliciously harmed revenue stream of Plaintiffs in order to prevent or delay legal action by Plaintiffs in order to seek to expire statute of limitations. Causes of action continue to this day and Plaintiffs only recently discovered much of the inside information via law enforcement and federal investigators.

Defendants' founders personally solicited and copied CEO business ventures and technologies and wanted to harm Plaintiffs' brand in order to mitigate discovery of that fact.

Plaintiffs testified for federal law enforcement against Defendants and Defendants sought to engage in retribution for Plaintiffs' testimony. In previous related cases, Plaintiffs won historical national legal precedents and overcame multi-million dollar federal litigation counter-measures by Defendants' and their associates. Plaintiffs are the first known Americans to receive a federal court confirmation that they were victimized by *a federal program infected with corruption and cronyism*. Defendants were the *crony* referred to by the U.S. Courts. The U.S. Federal Court has now issued one of, if not the, first rulings in U.S. Federal Court Record stating that Plaintiffs were in fact attacked by corrupt federal employees.

Plaintiffs' technologies obsolete Defendants' technologies and Defendants sought to damage Plaintiffs as witnesses and competitors.

Defendants sabotaged Plaintiffs' government contracts and circumvented and acquired Plaintiffs' money through illicit actions. Defendants traded campaign financing, that was not properly reported, in exchange for insider contracts and stock valuation pumps.

Defendants covertly work together and share common stock transactions, trusts, shell companies, campaign financing, contracts, and personal relationships.

Defendants operate a cartel-like organization which fully meets RICO violation parameters.

Defendants have been reporting to FBI, OSC, GAO, FTC, CFTC, EU, SEC and U.S. Congress on this case for many years and supportive federal case files are already deeply for this matter and any future Special Prosecutor hearings.

Defendants cannot argue time bar statute of limitations due to attacks as recently as today and revelations by the Justice Department as of this week.

Defendants cannot argue "Conspiracy Theory" or "Fake News" because the overwhelming current public opinion will destroy them within a week (ie: Voat.co)

95% of the entire 2017 White House Administration supports this case because Defendants spent hundreds of millions of dollars attacking 95% of the entire 2017 White House Administration. Every new FBI director on the short-list for the new FBI supports this case.

Plaintiffs have an advance copy of Defendants potential defense plan against this case. Plaintiffs have ongoing resources from law enforcement, investigators and journalists with deep factual repositories. China & Russia are thought to have hacked Defendants, and have begun posting leaks which are helpful to this case. In this election year, more beneficial leaks are expected by the press. Global public trends are tracking negative on Defendants. Plaintiffs won a federal court decision in a partially related case in which investigators found a "Cartel controlled by Defendants" to be the primary financier of the illicit activities. Recent news and government investigation reports prove that Defendants wild and bizarre actions actually took place, even though Defendants tries to play the charges off as "fantastical", in circumventing due process and government ethics programs. News reports of Defendants investors and executives sex scandals and tax evasions prove bad character aspects of defendants.

Defendant's attorney Michelle Lee runs the patent office and may have already attempted to interfere with Plaintiffs patent filings, The Defendants-created ALICE and IPR disruptions put Plaintiffs existing patents at risk if any of their patent #'s are named. One day after Plaintiffs was told they were about to receive their most recent patent, which USPTO had determined over-rode Defendants and Facebook, the USPTO reversed their decision after interjection from Defendants USPTO-based staff.

According to large numbers of investment publications, including Investor Place publication: Tesla Motors TSLA Stock: "*Tesla Motors Inc is "Worth \$660 Billion". Today, Apple Inc. (AAPL) is the largest company in the world. But Tesla Motors Inc (TSLA) stock could rocket so high in the next 10 or 15 years that the currently \$33 billion automaker exceeds even Apple's \$540 billion valuation. That's according to billionaire investor Ron Baron, CEO of Baron Capital, who went on CNBC this morning to rave about TSLA stock.*" There is more than enough proof that experts value Tesla Motors at a minimum of \$33B and over \$660B at a higher argument point. Plaintiffs competing car company, which had solved all of the problems Tesla has had and has a higher volume sales potential due to its lower retail pricing was worth at least \$33B and in excess of \$700B and that that one consideration accounts for \$700B of damages caused by Defendants in their attacks designed to interfere with the existence of Plaintiffs car company. In like manner, Plaintiffs broadcasting network was supplanted by Defendants broadcasting network which is now equivalent to Netflix or Univision. Motley Fool published a report that "Shares of streaming video pioneer **Netflix** ([NASDAQ:NFLX](#)) have had another outstanding year in 2015. The stock hit a new all-time high of \$132.20 last week. As Netflix stock has taken off, the company's market cap has surged from around \$20 billion in January to a staggering \$56 billion today." Univision has publicly stated that it is worth \$25B in its SEC filings. Thus Defendants attacks cost Plaintiffs venture group \$56B of additional damages by attacking and cloning another of Plaintiffs technologies and businesses. Plaintiffs energy company offered the equivalence of the energy company Bloom Energy which has a market valuation of \$3B and thus justifies a loss valuation to Plaintiff of at least \$3B. Copy cat companies Tesla Motors, Netflix and Bloom Energy are owned by, managed or co-mingled with Defendants Cartel as are Google and other holders. These companies have been proven, and will again be proven before the jury, to have been first developed, launched, marketed, patented, documented, commended and offered by Plaintiffs. Thus Defendants are clearly documented engaging in over \$720B of damages to Plaintiffs via their coordinated malicious attacks, ongoing Streisand-Effect re-attacks, copy-cat efforts, circumvention of Plaintiffs federal funds into Defendants pockets, interference and other actions. Defendants argument of "how could one entity have so many companies?" is made moot by the fact that EACH

of defendants principles and associates own HUNDREDS of companies apiece.

Damage Awards Demanded

- A percentage of each Defendants profits during the period in question.
- A mandated award of the federal contract that Defendants interdicted from Plaintiffs for Plaintiffs global vehicle manufacturing and energy companies by terminating Plaintiffs State and Federal funds and placing those funds in Defendants bank accounts.
- A percentage of the companies known as Defendants or Alphabet or a percentage of their revenue
- A percentage of all profits from Plaintiffs technologies used by Defendants
- Court ordered termination of the Gizmodo/Gawker/Jalopnik Nick Denton Tabloid Hit-Jobs-For-Sale Empire and the termination of the RICO violating Google/YouTube/Alphabet Cartel.
- Hit-Job damages awards (Hulk Hogan received a \$145M award for the same type of attack by the same parties. At all times Defendants and operative attackers were in the employ, command and control of each other and exchanged remuneration)
- Loss of income since the start of operations of Defendants
- Punitive damages
- Other damages in excess of five billion dollars

HULK HOGAN WINS THE SAME KIND OF CASE AND NOW IN A SIMILAR HISTORICAL WIN:

BOOM! Georgia Judge REFUSES to Throw out CNN's Effort to Dismiss a Fake News Court Case, Cites a Series of False and Defamatory News Reports

CNN is now on the verge of being proven a fake news source by Georgia courts! CNN attempted to get the case dismissed involving Davide Carbone, CEO of St. Mary's Medical Center in West Palm Beach who accused CNN of fabricating a story about his hospital.

(Contact our office for screen shot, DNS report and server log print-outs)

Federal Judge Orinda Evans
Zach Porter/Daily Report
02/02/09

Citing a *series of false and defamatory news reports* that insinuated St. Mary's had an infant mortality rate that was 3 times higher than the national average while ignoring information that made the Medical Center look good. The libel lawsuit against CNN seeking \$30 million in damages will continue onward thanks to federal district judge Orinda Evans.

Here is CNN's Fake news report about St. Mary's *they still have on their YouTube Page*.

Carbone, who actually lost his job due to the fake news reports **has presented enough evidence at this early stage of the case to suggest that CNN was acting recklessly with regard to the accuracy of its reporting** according to The National Law Journal.

To make matters worse, judge Evans also found evidence of *actual malice* when insisting on reporting the Medical Center was under an official investigation, even after Florida's Agency for Healthcare administration adamantly denied this was taking place.

Carbone's lawyer describes the ruling as a major victory.

False and defamatory accusations against real people have serious consequences, he said. *Neither St. Mary's or Mr. Carbone did anything to deserve being the objects of the heinous accusation that they harmed or put babies and young children at risk for profit.*

The ruling, he added, serves as a well-reasoned reminder that the media, its defense lawyers, and its lobbyists do not have a corner on the market of correct interpretation and application of the First Amendment.

GAWKER/UNIVISION HAVE A NEW WORLD TO LOOK FORWARD TO!

The Hit Job

How much do you have to pay Google, Alphabet, YouTube and Black Cube to dedicate a portion of their servers to push a character assassination set of links, against a competitor, to all five billion people on Earth with internet access? How much did Obama, Clinton, Bloomberg spend using those exact same systems to attack their political enemies?

We know. We have their financial records, invoices and receipts and so does the FBI and the NSA.

How much do you have to pay to get them to lock those attack links on one of the first 4 lines of EVERY search result, in the same position in the search results, for over a decade (which proves that their search results are not "organic", they are manually manipulated by Google and YouTube)? How much did Obama, Clinton, Bloomberg spend using those exact same systems to attack their political enemies?

We know. We have their financial records, invoices and receipts and so does the FBI and the NSA.

How much does it cost to make a Disney-like animated movie about a whistle-blower? How much does the production and software and person-hour billings cost? How much does it cost to distribute that movie world-wide and lock it in the top line of all search results?

We know. We have their financial records, invoices and receipts and so does the FBI and the NSA.

How much does it cost to hire a warehouse full of Russian, Nigerian and Chinese click-farm operators who use Palantir and Google software to instantly be alerted of any mention of a person's name on the internet and to then go slam that person in the comment sections with endless troll remarks? Elon Musk uses these same people to hype his narcissistic need for attention. Obama, Clinton, Bloomberg and other politicians hire these same people to attack their political adversaries. How much does it cost to have anonymous trolls in foreign countries kill a person's brand globally?

We know. We have their financial records, invoices and receipts and a huge number of lawsuits, court records, federal investigation and investigative journalism reports have exposed those records and details. The FBI, NSA, SEC, FTC and Congressional investigators can also confirm these numbers!

So it turns out that it costs: **\$35,422,152.00 to have a person and their business killed!**

That is how much they spent on their attack on the Plaintiff! The people at the top of the heap who organized the attacks were David Plouffe, Jay Carney, David Axelrod, Denis McDonough, Steve Rattner, Robert Gibbs, Rahm Emanuel and their associates and they did it from **The West Wing and The Oval Office in The White House.**

Many of the political attacks were edited by [Nick Denton](#) and his seedy tabloid empire Gawker/Gizmodo. Investigations have revealed that the White House and California Senators hired IN-Q-Tel; Gawker Media; Jalopnik; Gizmodo Media; K2 Intelligence; WikiStrat; Podesta Group; Fusion GPS; Google; YouTube; Alphabet; Facebook; Twitter; Think Progress; Media Matters; Black Cube; Correct The Record; Orbis Business Intelligence, Undercover Global Ltd; Stratfor; Jigsaw; ShareBlue/Acronym; Cambridge Analytica; Sid Blumenthal; David Brock; Plouffe Consulting; PR Firm Sunshine Sachs; Covington and Burling; Buzzfeed; Perkins Coie; Advance Democracy Inc.; The Democracy Integrity Project; Popily, Inc; Bean, LLC.; Edward Austin; Istok Associates; [Silicon Valley Community Foundation](#); Yonder and Wilson Sonsini to run hit-jobs, character assassinations, dirty tricks and economic reprisal attacks on any applicants who reported the crimes. Each of those companies are now under federal and civil investigation. These companies sell "kill services" that use CIA and KGB-style tactics to harm witnesses and whistle-blowers.

Media Matters for America founder David Brock is a hired media assassin who reaped illegal profits through the transfer of millions from a nonprofit he founded to a for-profit entity under his control, according to an IRS complaint filed by a watchdog group. The [complaint](#) details how Brock's nonprofit group American Bridge Foundation (AB Foundation) transferred \$2.7 million in tax-exempt assets to True Blue Media, a for-profit company owned by Brock that is the parent company of ShareBlue, a for-profit media company now known as [The American Independent](#). The transfers violated IRS rules that prohibit nonprofit organizations from using their tax-exempt resources to pay personal or private expenses of any key figures connected to the nonprofit, the complaint stated. AB Foundation's transfers to True Blue Media were disclosed in the nonprofit's Form 990s filed to the IRS in [2017](#) and [2018](#). *"Brock is a well-known hit man who took money to target our group in reprisal for whistle-blowing...."* Said Team 7 staff.

The money was conduited and assisted for pass-through by political financiers Eric Schmidt, Larry Page, Sergey Brin, Elon Musk, John Doerr, Vinod Khosla, Steve Westly, Steve Spinner and their [Silicon Valley oligarch Cartel](#) black-listing operation.

It was a felony. It violated RICO, Anti-Trust and Constitutional laws.

So they spent over thirty five million dollars attacking the Plaintiff and shutting down a competitor that was targeted to make over six billion dollars in profits. The attackers then made the six billion dollars in profits for themselves, at the expense of the Plaintiff.

So how much do you think they owe the Plaintiff per previous court awards for such crimes against a member of the public?

1 Defendants has a variety of such hidden codes and has various internal names for such codes besides, and in addition to, â PR8â . Defendants has been proven to use these fact vs. fiction rankings to affect elections, competitors rankings, ie: removing the company: NEXTAG from competing with Defendants on-line; or removing political candidates from superior internet exposure and it is believed by investigators and journalists, that Defendants are being protected from criminal prosecution by public officials who Defendants have compensated with un-reported campaign funding.

2 The EU case, and subsequent other cases, have demonstrated that Defendants sells such manipulations to large clients in order to target their enemies or competitors or raise those clients subliminal public impressions against competitors or competing political candidates. In fact, scientific study has shown that although Defendants claims to â update its search engine results and rankings, sometimes many times a dayâ , the attack links and codes against Plaintiffs have not moved from the top lines of the front page of Defendants for over FIVE YEARS. If Defendants were telling the truth, the links would have, at least, moved around a bit or disappeared entirely since hundreds of positive news about Plaintiffs was on every other search engine EXCEPT Defendants. Many other lawsuits have now shown that Defendants locks attacks against its enemies and competitors in devastating locations on the Internet. The entire nations of China, Russia, Spain and many more, along with the European Union have confirmed the existence and operation of Defendantsâ attack machineâ .

3 Major public figures and organizations, including the entire European Union, have also accused Defendants of similar internet manipulation by Defendants. The attacks, by Defendants, continue to this day. In 2016, the renowned Netflix series: â House of Cardsâ opened its sixth season with a carefully held script-surprise researched by the script factuality investigators for the production company of â House of Cards.â The surprise featured Defendants, fictionally named â PollyHop,â and described, in detail, each of the tactics that Defendants uses to attack individuals that Defendants owners have competitive issues with. The Plaintiffs maintains that each and every tactic included in the televised example were tactics actually used to attack the Plaintiffs, his intellectual properties, his peers and his associates as threatening competitors.

GOOGLE FOUND TO MANUALLY MANIPULATE THE ENTIRE INTERNET FOR GOOGLE OWNERS PERSONAL RELIGIOUS AND POLITICAL VIEWS

REVEALED: Two More Google Blacklists Designed To Remove âFringe Domainsâ And Op-Eds From Special Search Results

| Tech

J. Arthur Bloom | Deputy Editor

At least two other blacklists are applied to Googleâs web answers feature, one of which is manually edited, documents obtained by The Daily Caller indicate.

The first blacklist, titled âwebanswers_url_blacklist,â impacts the companyâs âfeatured snippetsâ or answer blocks, the type of special search result that appears when questions are typed into the search bar. For example, the question âWhat is the biggest fish?â yields a special search box on the whale shark. [\(EXCLUSIVE: Documents Detailing Googleâs âNews Blacklistâ Show Manual Manipulation Of Special Search Results\)](#)

In screenshots of the blacklist shared with The Daily Caller, the instructions at the top of the page say, âTo ensure the blacklist will REMOVE a URL, add a line â# REMOVE urlâ .â And, âTo ensure the blacklist WONâT remove a URL by accident, add â# PERMIT urlâ ,â indicating that the blacklist is manually edited.

One of the blacklisted results was a Washington Post [op-ed](#) titled, âHow Vladimir Putin Became The Worldâs Favorite Dictator,â which the algorithm pulled in response to the query âwho is the dictator of Russia.â

In one of the changelogs for the web answers blacklist, a Googler alludes to the blacklisting of all opinion content for web answers.

âWe are going to be removing opinion docs from all of newsey/political/sensitive webanswers. So, BLing any document that we consider to be clearly opinion is not an issue,â the note says.

NEW YORK, NY â JUNE 3: The Google logo adorns the outside of their NYC office Google Building 8510 at 85 10th Ave on June 3, 2019 in New York City. Shares of Google parent company Alphabet were down over six percent on Monday, following news reports that the U.S. Department of Justice is preparing to launch an anti-trust investigation aimed at Google. (Photo by Drew Angerer/Getty Images)

âFeatured snippets are a feature within Search that highlights web sources that are likely to contain what youâre looking for,â a spokesperson for Google told The Daily Caller. âDue to the special formatting they receive, we have policies that prevent us from showing a featured snippet for topics like civics or medical information where the content lacks broad consensus. Our systems are designed to not show featured snippets that would violate our policies, and we take action if violating snippets still appear. These policies and actions have no impact on how a page ranks in organic search listings.â

According to Google, they are working on developing ways to ensure that algorithms are weeding out inappropriate web answers rather than having to do so manually. The second web answers blacklist, called `all_fringe_domains`, appears to be an example of this, as it seems to be generated by an algorithm.

A portion of the fringe domains list was shared with The Daily Caller. On it are the American Spectator, Breitbart, Breaking911, the website of pastor Brian Jones, the website of [Bring Your Bible to School Day](#), Consortium News (published by Robert Parry), St. Philip the Deacon Lutheran Church, speakerryan.com, The Franklin Society (a cryptocurrency blog), Free Thought Project, The Gateway Pundit, and The Gorka Briefing.

In addition, several blogs critical of conservatives are on the fringe domains blacklist, including Breitbart Unmasked and Spencer Watch, a blog critical of Jihad Watchâs Robert Spencer.

Google CEO Sundar Pichai told Congress in December that the company does not â manually intervene on any particular search result.â [\(RELATED: Google Fires Republican Engineer Who Spoke Out Against â Outrage Mobsâ\)](#)

But in fact Google does manually intervene in several different types of special search results, as The Daily Caller [revealed](#) in April, through their news blacklist. The web answers blacklist is more evidence that they do manually intervene in particular search results.

Pichai also said in a recent interview with Axios that the company wants to â really prevent borderline content, content which doesnât exactly violate policies.â

Google is facing pressure from both the Republican administration and the Democrat-controlled House, with a Department of Justice antitrust probe and a new [set of hearings](#) in Congress on competition in digital markets.

GOOGLE IS DESTROYING INVENTORS AND AMERICAN INNOVATION

Google Is Posing A Serious Threat To Innovation

[Frank V. Vernuccio, Jr.](#)

Noah Loverbear via Wikimedia Commons

For years, Google has functioned as the world's digital commons—a place where users aggregate, store, and search for publicly-available knowledge. It's served as a hub for internet activity and a portal through which people can access the collective understanding of mankind.

Without a doubt, Google takes its role in society quite seriously. From its longstanding effort to [digitize](#) libraries to its most recent attempt to [collect](#) and log medical records, Google has worked tirelessly to create a common feast of information that anyone can access.

But increasingly, Google's open-source approach to information sharing is creating far more problems than solutions. And nowhere is this fact more clearly illustrated than within the intellectual property (IP) sphere. Google's notably lax approach to IP has thrown the entire copyright industry into chaos. Moreover, it has resulted in perhaps the most influential IP lawsuit in decades: [Google v. Oracle](#).

Granted review by the nation's highest court, the Supreme Court is currently being flooded by a wave of Amicus Briefs on the issue. But individual and corporate interests aside, the upcoming Supreme Court case reflects an unfortunate truth about Google's approach to intellectual property. Rather than contribute to the greater good, the company's common feast position on IP is leaving innovators to starve.

The case revolves around a years-old incident that occurred between Oracle—the owner of Java, a programming language and computing platform first released by Sun Microsystems in 1995—and Google. Instead of purchasing a licensing agreement from Oracle to use the Java software, Google chose to copy a substantial portion of the program's code to use within its own mobile phone software, Android. Then, as Google is wont to do, the company made the operating system open source, allowing phone carriers and app developers to utilize the operating system without cost.

The only problem: that intellectual property wasn't theirs to give away. Oracle stated as much when it sued Google for copyright infringement. But, in its January 2020 [brief](#) to the Supreme Court, Google disagreed. It argued that its replication of the code constituted a fair use, an argument that had been previously rejected by both the Trump administration and the lower courts. But Google wasn't deterred. Instead, it has continued to argue that its reuse of the Java code, and the subsequent creation of Android, benefitted the greater good and that, in effect, justifies the code's replication.

According to Google, the search engine company was once again adding to the common feast of public information and their replication of Oracle's copyrighted code merely contributed to that process. That perspective, however, illustrates precisely why Google's approach to IP is so dangerously misguided.

In short, Google's common feast position is incompatible with intellectual property rights. Much like the [tragedy of the commons](#) thought experiment, the common feast approach to IP would rob any incentive for innovators to produce. As a result of Google's perspective, software code that could benefit the public domain could lose its intellectual property protections. But those protections are the very reason innovation occurs in the first place. Without security against IP theft, progression would slow to a halt, and ironically, the public would suffer as a result.

The potential impact is not confined to software alone, either. The expansion of the fair use doctrine that Google seeks threatens any creative content, including advertising material, customer reviews, product descriptions, photographs, destination guides, and more. Other businesses may benefit from sharing and placement of their content on a variety of online platforms, but as the content owners, they should not have to give up control of whether, when, and how they allow their content to be used.

Ultimately, Google's approach to IP is antithetical toward the spirit of innovation. It would strip away not only the legal protections afforded to one's labors, but also the very rationale to labor in the first place. Indeed, Google's argument in *Google v. Oracle* is a dangerous proposition that must be rejected. The company may pride itself in its role in the digital commons, but its common feast perspective would certainly not benefit the greater good.

Frank V. Vernuccio, Jr., J.D., is the president of the American Analysis of News & Media, Inc., and the editor-in-chief of its major publication, the New York Analysis of Policy and Government.

GOOGLE IS THE ISIS OF THE INTERNET

By Carla Reed

Just look at an outline just one example of a vast number of complaints against Google filed by hundreds of thousands of complainants:

"... Our Main Issues With Google:

- Larry Page, Jared Cohen, Sergey Brin and Eric Schmidt have systematically stolen each and every patent, trade secret and business model from us, which we launched years prior, including the architecture and business model for YouTube and Google itself. The NY Times article exposes Page's idea-theft process.

*- Google staffed and controlled the Obama White House and redirected our government funds to Google's, and Google's investors, bank accounts while operating the largest political **Dark Money** conduit system in the world.*

- Google exchanged compensation with Elon Musk, Dianne Feinstein and political party executives in order to produce, and mass-media-distribute, character assassination smear videos, Gawker/Gizmodo/Jalopnik tabloid hatchet job articles and fake blog posts in front of seven billion people for over a decade, locked on the top line, of the front page, of all Google product search results. At the same time, Google hid, de-listed, server code limited, down-ranked and deleted all of our advertising and positive PR. Google received and exchanged over thirty million dollars of compensation in cash, contracts, services, revolving door jobs and other remuneration, not reported to the FEC, for these attacks.

- Domestic and foreign Intelligence agency experts, law enforcement experts, forensic specialists and Congressional advisers have acquired all of Google's emails, financial reports, off-shore transaction records and employee testimony proving these assertions...."

How can Google/Alphabet get away with such misdeeds?

Because Google bought most of the politicians you have heard of. Christie Lee McNally is out to expose Google's "Mafia-like" operation through Free Our Internet!

Free Our Internet is a non-profit organization describing itself as an opponent of the "tech-left" and its political censorship of "conservative speech online."

McNally said:

"They control over 90 percent of the internet, so they don't need to capitulate to us, they don't need to capitulate to the Senate [or] the president. They don't need to capitulate because they've bought them all. The amount they pay in lobbyists if you look at FEC reports and how much they pay in lobbyists [and in] Washington, DC, they don't have to worry about legislation."

"Clearly they lied last month when they went up there," said McNally of Twitter and Facebook executives' denial of political censorship across their digital platforms during testimony before congressional committees.

Open Secrets itemized Google's lobbying spending via the technology company's FEC filings, with its most recent data coming from 2014.

The top recipient of Google's lobbying spending in 2014 was the Podesta Group...founded by Clinton loyalist and founder of the Center for American Progress and its subsidiary ThinkProgress.

Google (now part of parent company Alphabet) spent over \$18 million lobbying politicians in 2017, according to federal disclosure records. According to the Center for Responsive Politics, this is the first time a technology company has spent the most on lobbying costs in at least two decades. Google did not return TIME's request for comment about its lobbying activities.

Marlow described the threat to free speech and expression posed by large technology firms as "100 times the threat" compared with left-wing media outlets.

How the mighty have fallen: Anglian Water knocks Google off perch as UK's best workplace

Facebook not even in survey's top 50, while Goldman Sachs lords it over tech's big-hitters

By [Rebecca Hill](#)

10  [SHARE](#) $\hat{=}$ $\frac{1}{4}$

It would appear that the kickback against big tech continues apace as Facebook has dropped out of a list of the top 50 best places to work in the UK and Google has been knocked off its top spot... by a water company.

That's according to the [results](#) from the 2019 Employee's Choice Best Places To Work list, which is compiled each year by Glassdoor based on staffer feedback between October 2017 and October 2018.

The Chocolate Factory has, in fact, crashed out of the top 10 altogether into 13th position $\hat{=}$ just behind everyone's favourite crystal ball-gazer Gartner.

But it's not as bad as Facebook, which was ranked fourth last year and has disappeared from the top 50 entirely.

The highest-scoring tech vendor is Salesforce, which stayed in fifth. The company often [boasts about its ethical credentials](#) and calls its staff "Ohana" after the Hawaiian term for family bonds. Aw.

Lower down the list are Cisco (37), Apple (43), Siemens (46) and Accenture (48) $\hat{=}$ all of which were beaten by the "[great vampire squid](#)" Goldman Sachs (36).

The fortunes of Microsoft, however, went the other way, rising from 24th to 11th. But perhaps the most improved firm was SAP, which shot up from 47th to eighth.

This year the German ERP giant has overhauled its image, forking out for star-studded [commercials](#) to sell the idea that it will make the world a better place, and pushing a message of trust in the aftermath of the indirect licensing saga. Whether [customers](#) would rate it so highly is another question.

In the US, the tech giants at the centre of data harvesting and tracking scandals also saw a slight decline $\hat{=}$ Facebook lost its top spot, falling to seventh and Google fell from fifth to eighth.

LinkedIn, meanwhile, climbed the ranks from 21st to sixth as Salesforce tiptoed closer to the top 10, stopping at 11th up from 15th this year. $\hat{=}$ ®

The man who visited North Korea a few times while working with Obama Admin. Wonder what he was up to there...

Speaking to Google, I would ask about the secretive visit of Google Chairman Eric Schmidt to North Korea in 2013. Then, the North Korean regime was on life watch. Now, just four years later, North Korea has an intercontinental ballistic missile, a thermonuclear bomb, and a cyber-warfare corps.

Eric Schmidt was accompanied by Bill Richardson, a former Democrat governor of New Mexico. At that time Richardson was on the boards of World Resources Institute and the National Council for Science and the Environment. Coincidentally, the Obama administration closed an anti-trust probe of Google just a few days before that visit, despite the written recommendation to file a civil lawsuit against Google, made by the bureau of competition in 2012 (2). Well, many things happened in that time frame.

GOOGLE PUSHES TRANNIES BECAUSE LARRY PAGE AND MOST GOOGLE EXECS LOVE TRANNIES

Google is selectively targeting people to turn them INTO trannies. The search pages, the ads, the entertainment are all warped to push certain ideas into certain people's heads. Google selected him to be a tranny. What did their AI select you to be? I would imagine the thing targets everybody with tailor made degeneracy. It attacks your brain like a rubics cube trying to turn you into their creation.

If you would like to isolate the effect, you might try connecting through a VPN, and using something like Firejail, with Firefox operating in "double" private mode. This will prevent any memory from writing directly to your disk and from Google's scripts from being able to see your files directly. You will have to login each time and it won't store your information. But at least then you can get an idea of what your searches would be like if you weren't you.

Of course we all know Google is really using the control processor on your computer's microchip to tag all your network connections, so the CIA or NSA always knows its you. You're only really blind to the advertising and commercial sides of the organization. Also they can identify some network traffic regardless of encryption.

GOOGLE SPENDS BILLIONS OF DOLLARS IN BRIBES AND LOBBYING IN ORDER TO STEAL IDEAS AND TECHNOLOGIES

- Google put its insider lawyer: Michelle Lee, in charge of the U.S. Patent Office
- Google paid billions of dollars to change Patent Office laws so that small inventors could not sue Google when Google took their technologies
- Google paid bribes to U.S. Senators and regulators and ordered them to not make laws that would stop Google from IP theft
- Google spent billions of dollars to hire shill bloggers, 'reporters' and TechDirt-type shill websites to publish Troll Articles to say patent rights for small inventors
- Google hired In-Q-Tel, Fusion GPS, Tech Dirt, Black Cube, Gawker, Gizmodo and other character assassination firms to attack inventors trying to sue Google for theft
- Lawsuits suing Google for IP theft specifically state that Google is a 'Racketeering' organization

â There is no other description for this than the muzzling of political speech,â the Trump campaign wrote in a [joint](#) statement with the Republican National Committee, National Republican Senatorial Committee and National Republican Congressional Committee.

They were referring to Googleâs Nov. 20 [decision](#) to limit a political campaignâs ability to narrowly target advertisements. The statement added: â Google is clamping down on voter engagement and suppressing voter turnout.â

Google changed its political advertisement policy. The tech company will allow political advertisers to target voters by age, gender and ZIP code â but they can no longer home in on voter affiliation or use information based on public voter records, Google [announced](#) in a statement.

The press statement also noted that the Trump campaign would not be the only campaign impacted. Democrats and Republicans, as well as political groups, would likely feel the effect, according to the presidentâs team.

Past media reports show environmental groups are worried such policies could hurt their ability to push back against Trump's climate policies.

Sen. Elizabeth Warren and other activists railed against Twitter in October after the company [announced](#) plans to stop hosting political advertising by Nov. 22. Twitter CEO Jack Dorsey tweeted about the change and said it applies to candidate ads and issue ads as well.

Warren [thrashed](#) the decision after a [report](#) suggested climate activists were unable to spread policy messages on the platform. The Massachusetts Democrat linked to a [report](#) from Heated, a newsletter devoted to discussing climate issues. The report suggested Twitter is allowing ExxonMobil to run ads [defending](#) itself from a volley of climate lawsuits.

GOOGLE'S SELFISH LEDGER IS AN UNSETTLING VISION OF SILICON VALLEY SOCIAL ENGINEERING

Even though the entire world now knows that Google is a sick sociopath spy operation, tone deaf Google executives still plod along their path of extremist information and politics manipulation

By [Vlad Savov@vladsavov](mailto:Vlad.Savov@vladsavov)

[ARE](#)

Google has built a multibillion-dollar business out of knowing everything about its users. Now, a video produced within Google and obtained by *The Verge* offers a stunningly ambitious and unsettling look at how some at the company envision using that information in the future.

The video was made in late 2016 by Nick Foster, the head of design at X ([formerly Google X](#)) and a co-founder of the [Near Future Laboratory](#). The video, shared internally within Google, imagines a future of total data collection, where Google helps nudge users into alignment with their goals, custom-prints personalized devices to collect more data, and even guides the behavior of entire populations to solve global problems like poverty and disease.

When reached for comment on the video, an X spokesperson provided the following statement to *The Verge*:

“We understand if this is disturbing -- it is designed to be. This is a thought-experiment by the Design team from years ago that uses a technique known as “speculative design” to explore uncomfortable ideas and concepts in order to provoke discussion and debate. It’s not related to any current or future products.”

All the data collected by your devices, the so-called ledger, is presented as a bundle of information that can be passed on to other users for the betterment of society.

Titled *The Selfish Ledger*, the 9-minute film starts off with a history of Lamarckian epigenetics, which are broadly concerned with the passing on of traits acquired during an organism’s lifetime. Narrating the video, Foster acknowledges that the theory may have been discredited when it comes to genetics but says it provides a useful metaphor for user data. (The title is an homage to Richard Dawkins’s 1976 book *The Selfish Gene*.) The way we use our phones creates “a constantly evolving representation of who we are,” which Foster terms a “ledger,” positing that these data profiles could be built up, used to modify behaviors, and transferred from one user to another:

“User-centered design principles have dominated the world of computing for many decades, but what if we looked at things a little differently? What if the ledger could be given a volition or purpose rather than simply acting as a historical reference? What if we focused on creating a richer ledger by introducing more sources of information? What if we thought of ourselves not as the owners of this information, but as custodians, transient carriers, or caretakers?”

The so-called ledger of our device use “the data on our actions, decisions, preferences, movement, and relationships” is something that could conceivably be passed on to other users much as genetic information is passed on through the generations, Foster says.

Building on the ledger idea, the middle section of the video presents a conceptual Resolutions by Google system, in which Google prompts users to select a life goal and then guides them toward it in every interaction they have with their phone. The examples, which would â reflect Googleâs values as an organization,â include urging you to try a more environmentally friendly option when hailing an Uber or directing you to buy locally grown produce from Safeway.

An example of a Google Resolution superimposing itself atop a grocery storeâs shopping app, suggesting a choice that aligns with the userâs expressed goal.

Of course, the concept is premised on Google having access to a huge amount of user data and decisions. Privacy concerns or potential negative externalities are never mentioned in the video. The ledgerâs demand for ever more data might be the most unnerving aspect of the presentation.

Foster envisions a future where â the notion of a goal-driven ledger becomes more palatableâ and â suggestions may be converted not by the user but by the ledger itself.â This is where the *Black Mirror* undertones come to the fore, with the ledger actively seeking to fill gaps in its knowledge and even selecting data-harvesting products to buy that it thinks may appeal to the user. The example given in the video is a bathroom scale because the ledger doesnât yet know how much its user weighs. The video then takes a further turn toward anxiety-inducing sci-fi, imagining that the ledger may become so astute as to propose and 3D-print its own designs. *Welcome home, Dave, I built you a scale.*

A conceptual cloud processing node that is analyzing user information and determining the absence of a relevant data point; in this case, user weight.

Fosterâs vision of the ledger goes beyond a tool for self-improvement. The system would be able to â plug gaps in its knowledge and refine its model of human behaviorâ â not just your particular behavior or mine, but that of the entire human species.â By thinking of user data as multigenerational,â explains Foster, â it becomes possible for emerging users to benefit from the preceding generationâs behaviors and decisions.â Foster imagines mining the database of human behavior for patterns, â sequencingâ it like the human genome, and making â increasingly accurate predictions about decisions and future behaviours.â

â As cycles of collection and comparison extend,â concludes Foster, â it may be possible to develop a species-level understanding of complex issues such as depression, health, and poverty.â

A central tenet of the ledger is the accumulation of as much data as possible, with the hope that at some point, it will yield insights about major global problems.

Granted, Fosterâs job is to lead design at X, Googleâs â moonshot factoryâ with inherently futuristic goals, and the ledger concept borders on science fiction â but it aligns almost perfectly with attitudes expressed in Googleâs existing products. Google Photos already presumes to know what youâll consider life highlights, proposing entire albums on the basis of its AI interpretations. Google Maps and the Google Assistant both make suggestions based on information they have about your usual location and habits. The trend with all of these services has been toward [greater inquisitiveness and assertiveness](#) on Googleâs part. Even email compositions are being [automated in Gmail](#).

At a time when the ethics of new technology and AI are entering the broader public discourse, Google continues to be caught unawares by the potential ethical implications and downsides of its products, as seen most recently with its demonstration of the [Duplex voice-calling AI at I/O](#). The outcry over Duplexâs potential to deceive prompted Google to add the promise that [its AI will always self-identify](#) as such when [calling unsuspecting service workers](#).

The Selfish Ledger positions Google as the solver of the worldâs most intractable problems, fueled by a distressingly intimate degree of personal information from every user and an ease with guiding the behavior of entire populations. Thereâs nothing to suggest that this is anything more than a thought exercise inside

Google, initiated by an influential executive. But it does provide an illuminating insight into the types of conversations going on within the company that is already the world's most prolific personal data collector.

Masters of the Universe: Leaked Video Shows Google's Vision of Total Data Collection

[Associated Press](#) 17 May 2018 [2436](#)

[The](#)

A leaked internal video from Google portrays the company's vision of total data collection.

The 2016 video made by Google X's Head of Design Nick Foster was [obtained](#) by the Verge, and discusses how users could choose a life goal, which Google then attempts to steer them towards through personalization.

It imagines a future of total data collection, where Google helps nudge users into alignment with their goals, custom-prints personalized devices to collect more data, and even guides the behavior of entire populations to solve global problems like poverty and disease, [declared](#) the Verge, who reported that the middle section of the video presents a conceptual Resolutions by Google system, in which Google prompts users to select a life goal and then guides them toward it in every interaction they have with their phone.

The examples, which would reflect Google's values as an organization, include urging you to try a more environmentally friendly option when hailing an Uber or directing you to buy locally grown produce from Safeway, they explained, adding that, The system would be able to plug gaps in its knowledge and refine its model of human behavior not just your particular behavior or mine, but that of the entire human species.

After the Verge reached out to Google's X team for comment, a spokesman responded, "We understand if this is disturbing — it is designed to be. This is a thought-experiment by the Design team from years ago that uses a technique known as 'speculative design' to explore uncomfortable ideas and concepts in order to provoke discussion and debate. It's not related to any current or future products."

Google's Censored Search Would Help China Pay Eric Schmidt More Bribes Said Ex-CEO Eric Schmidt

[Ryan Gallagher](#)

Former Google CEO Eric Schmidt has defended the company's plan to build a censored version of its search engine in China.

In an [interview](#) with the BBC on Monday, Schmidt said that he wasn't involved in decisions to build the censored search platform, code-named Dragonfly. But he insisted that there were many benefits to working with China and said he was an advocate of operating in the country because he believed that it could help change China to be more open.

As The Intercept first [revealed](#) in August, Google developed a prototype of the censored search engine that was designed to remove content that China's ruling Communist Party regime deems sensitive. The search engine would have blacklisted thousands of words and phrases, including terms such as human rights, student protest, and Nobel Prize in Mandarin.

The revelations prompted a wave of [protests](#) inside and outside of Google, with employees, activists, and [prominent](#) lawmakers [demanding](#) an end to the project. Google subsequently stated that it had ceased work on Dragonfly and moved employees to new projects.

[Read our Complete CoverageGoogle Dragonfly](#)

Prior to its public exposure, Google executives had [worked hard to keep Dragonfly secret](#) within the company. Only a few hundred of the company's 88,000 workforce knew about it.

In his BBC interview, Schmidt was questioned on the level of secrecy around the plan and how it squared with Google's commitments to transparency. The former CEO claimed in response that certainly the people who were building all these products knew about it.

A Google employee with knowledge of Dragonfly was angered by Schmidt's remarks, characterizing them as bullshit. The source said that probably 90 percent of engineers [in Google's search department] had no idea [about Dragonfly] and were very upset when they learned that their work was contributing to this.

A major complaint from Google employees about the plan for the censored search engine was that they felt the end uses of their work had been withheld from them. For instance, some employees discovered that they had been working on code or improvements to aspects of Google main search platform, which was then being implemented without their knowledge or approval into the censored version of search for China.

In a protest letter [published last year](#), Google employees said that they did not have the information required to make ethically-informed decisions about our work, our projects, and our employment. They called for more transparency, a seat at the table, and a commitment to clear and open processes, adding, Google employees need to know what we're building.

Schmidt served as Google CEO for a decade between 2001 and 2011. He [still](#) serves on parent company Alphabet's board of directors, alongside co-founders Larry Page, Sergey Brin, and current CEO Sundar Pichai. Schmidt is [expected](#) to leave the board in June while remaining a technical adviser to the company.

A Google employee was angered by Schmidt's remarks, characterizing them as
"bullshit."

During Schmidt's tenure as CEO, in 2006, Google launched a search engine in China but pulled out of the country in 2010, due to concerns about Chinese government interference. At that time, Brin [said](#) the decision to stop operating search in the country was mainly about "opposing censorship and speaking out for the freedom of political dissent."

Schmidt revealed in his BBC interview that he had argued against Brin "believing that the company should remain in China, despite the censorship requirements. He said he felt that it was better "to stay in China and help change China to be more open."

Brin has previously said that he felt the same way for a period of time "that Google could help China embrace greater internet freedom. But he watched as the company, over a number of years, faced increasing censorship requests from the Chinese government. "Things started going downhill, especially after the Olympics [in Beijing in 2008]," Brin said in a 2010 [interview](#). "And there's been a lot more blocking going on since then. "[S]o the situation really took a turn for the worse."

Today, according to analysts, the level of internet freedom in China has continued to degrade. The country's government has ramped up constraints on the flow of information into the country. In 2016, the Communist Party regime passed a new cybersecurity law, which Human Rights Watch [said](#) "strengthens censorship, surveillance, and other controls over the internet." The group noted that "internet control has reached new heights since President Xi Jinping assumed power in March 2013."

Schmidt told the BBC that Google was no longer pursuing Dragonfly but couldn't rule out that changing in the future. "I am no longer involved in the management of the company so I shouldn't comment," he said.

Google's Eric Schmidt Says Americans Too Dumb To Detect Fake News, Plans to 'Derank' Russian News

TOPICS: [Derrick Broze](#) [Fake News](#) [Google](#) [Media](#) [Russia](#)

NOVEMBER 21, 2017

By [Derrick Broze](#)

Eric Schmidt has made news with his latest announcement that Google is working on ways to 'derank' Russian media in the search engine's results.

At this weekend's [Halifax International Security Forum in Canada](#), Eric Schmidt, former CEO of Google and current executive Chairman of Alphabet Inc., [discussed](#) Google's efforts to deal with the apparent rise of fake news. Specifically, Schmidt was talking about how the search engine giant might limit the spread of 'Russian Propaganda.' Mr. Schmidt said Google might 'derank' fake news stories, going as far as mentioning Russian news stations Russia Today (RT) and Sputnik.

'We are working on detecting and deranking those kinds of sites that's basically RT and Sputnik,' Schmidt said. 'We are well aware of it, and we are trying to engineer the systems to prevent that [the content being delivered to wide audiences]. But we don't want to ban the sites that's not how we operate.'

Posted by [Halifax International Security Forum](#) on Saturday, November 18, 2017

Schmidt said Google was not in favor of censorship, but would rather focus on ranking. â I am very strongly in favor of ranking. Itâ s what we do,â he stated. â Itâ s a very legitimate question as to how we rank, A or B, right? And we do the best we can in millions and millions of rankings every day.â

The comments about Russian state-owned media broadcasting in English to Americans are the latest consequence of the continued propaganda about Russians â hackingâ or â interferingâ with the 2016 election. The media claims Russia hacked the Democratic National Committee and used WikiLeaks to disseminate the information to the American public. Even if the DNC was hacked by a hacker originating in Russia there has never been any evidence that â the Russiansâ forced Americans to vote one way or the other.

The corporate media continues to push the narrative despite the biggest bombshell being that Russian intelligence agencies MAY have created FB accounts for the purpose of creating ads aimed at influencing Americansâ election choices. Releasing factual information barely counts as â interferenceâ and does not qualify as hacking by any stretch of the imagination. Regardless, the American politicians and compliant media push forth with the narrative that the Russians stole the election from the American people. As part of this blame game, Twitter recently announced they would no longer accept ads from RT and Sputnik. Just last week [RT had to register as a â foreign agentâ](#) with the US Department of Justice or face fines and confiscation of property.

Interestingly, Schmidt stated that the 2016 election shows that American audiences are incapable of distinguishing between fake news and real news. Instead, Schmidt believes it is up to tech-giants and their buddies in the government to decide what stories the people are allowed to see and read.

â We started with the default American view that â badâ speech would be replaced with â goodâ speech, but the problem found in the last year is that this may not be true in certain situations, especially when you have a well-funded opponent who is trying to actively spread this information,â Schmidt stated at the forum.

The idea that both Trump and Clinton were not backed by powerful, wealthy interests is laughable. Both the Democratic and Republican corporate parties are beholden to forces with power and connections beyond the imagination of the average American. Schmidt himself is one of the wealthiest people on the planet worth an estimated \$12 billion. In 2012 he was an adviser on digital operations for the Obama campaign and, according to John Podestaâ s emails, Schmidt offered the same services to Hillary Clintonâ s campaign in 2015.

Sputnik and RT Editor-in-Chief Margarita Simonyan responded to Eric Schmidtâ s comments with [the following statement](#):

Good to have Google on record as defying all logic and reason: facts arenâ t allowed if they come from RT, â because Russiaâ â even if we have Google on Congressional record saying theyâ ve found no manipulation of their platform or policy violations by RT.

In reality, the comments by Eric Schmidt and the fake news meme have always been about controlling or limiting the reach of the independent and alternative media which offers a contrary perspective to the statist, corporatist deadstream media. If Americans stand by and do nothing as the Russian alt media comes under

attack you better be prepared for the day that Eric Schmidt and/or the American political class announce the “deranking” of alternative views about 9/11, vaccinations, the weather, the food, the water, the environment, the wars, or the Surveillance/Police State. Google, YouTube, FB, and Twitter are the establishment social media tools. If we centralize all of our efforts through these platforms we are setting ourselves up for failure.

Google's New Fact-Check Feature Almost Exclusively Targets Conservative Sites

[ERIC LIEBERMAN](#)

Play Video

Google, the most powerful search engine in the world, is now displaying fact checks for conservative publications in its results.

No prominent liberal site receives the same treatment.

And not only is Google's fact-checking highly partisan — perhaps [reflecting](#) the [sentiments](#) of its [leaders](#) — it is also blatantly wrong, asserting sites made âclaimsâ they demonstrably never made.

When searching for a media outlet that leans right, like The Daily Caller (TheDC), Google gives users details on the sidebar, including what topics the site typically writes about, as well as a section titled âReviewed Claims.â

Vox, and other left-wing outlets and blogs like Gizmodo, are not given the same fact-check treatment. When searching their names, a âTopics they write aboutâ section appears, but there are no âReviewed Claims.â

In fact, a review of mainstream outlets, as well as other outlets associated with liberal and conservative audiences, shows that only conservative sites feature the highly misleading, subjective analysis. Several conservative-leaning outlets like TheDC are âvetted,â while equally partisan sites like Vox, ThinkProgress, Slate, The Huffington Post, Daily Kos, Salon, Vice and Mother Jones are spared.

Occupy Democrats is apparently the only popular content provider from that end of the political spectrum with a fact-checking section.

Big name publications like The New York Times, The Washington Post, and the Los Angeles Times are even given a column showcasing all of the awards they have earned over the years.

The Robert Mueller fact check (pictured above) is a case in point for Google's new feature.

Ostensibly trying to sum up the crux of the post, the third-party fact-checking organization says the claim in a DC article that special Counsel Robert Mueller is hiring people that are all Hillary Clinton supporters is misleading, if not false.

The problem is that TheDC's [article makes no such claim](#). Their cited language doesn't even appear in the article. Worse yet, there was no language trying to make it seem that the investigation into the Trump administration and Russia is entirely comprised of Clinton donors. The story simply contained the news: Mueller hired a Hillary Clinton donor to aid the investigation into President Donald Trump.

Still, the Washington Post gave the claim, which came from Trump himself, its official Three Pinocchio rating. The method applies to several other checks. Claims concocted or adulterated by someone outside the TheDC are attributed to TheDC, in what appears to be a feature that only applies to conservative sites.

Examples of such misattribution and misrepresentation are aplenty.

For instance, [using Snopes.com](#), an organization with [highly dubious](#) fact-checking capabilities, Google's platform shows an article by TheDC to have a so-called mixture of truth.

The "claim" made, according to Snopes.com and Google, is "a transgender woman raped a young girl in a women's bathroom because bills were passed" "a"

A quick read of the news piece shows that there was no mention of a bill or any form of legislation. The story was merely a straightforward reporting of a disturbing incident originally reported on by a local outlet. [\(RELATED: Why is Google CEO Eric Schmidt Technically Serving In The Department Of Defense?\)](#)

And like Snopes, another one of Google's fact-checking partners, Climate Feedback, is not usually regarded as objective.

Snopes and Google also decided to "fact-check" an [obviously tongue-in-cheek article](#) in which a writer for TheDC pokes fun at a professor saying the solar eclipse in 2017 was naturally racist.

Even Vox [pointed out](#) the absurdity of the educator's literary tirade on Mother Nature's purported racial prejudice, and the damage it might have done to real arguments of apparent racism. While Snopes got some flak for its choice, no one seems to have noticed the absurdity of the world's go-to search engine providing fact-checks to purposefully irreverent content, rather than hard news stories.

Overall, such inclusion embodies Google's fact-checking services, which, as many presciently feared, are biased, if not also downright libelous. [\(RELATED: Silicon Valley Seems To Love Burying Conservative News\)](#)

Google acknowledged it received an inquiry from TheDCNF, but did not fully respond by time of publication.

Google's blacklisting of pro-America websites is proof of illegal election rigging by the evil tech giant

: [JD Heyes](#)

Tags: [algorithms](#), [Big Tech](#), [blacklists](#), [Censorship](#), [deception](#), [denials](#), [editorial control](#), [engineers](#), [Google](#), [investigation](#), [Left-wing](#), [lies](#), [manipulation](#), [political bias](#), [real investigations](#), [research](#), [search algorithms](#), [search results](#), [thought control](#)

([Natural News](#)) Officials at tech behemoth Google have alternately claimed the company doesn't manipulate searches, improperly curate results, or keep a blacklist of sites that it either buries or bans altogether.

But a new report from [The Wall Street Journal](#) involving extensive analysis and research found that in reality, the company does all three of those things.

The paper notes:

Twenty years ago, Google founders began building a goliath on the premise that its search algorithms could do a better job combing the web for useful information than humans. Google executives have said repeatedly in private meetings with outside groups and in congressional testimony that the algorithms are objective and essentially autonomous, unsullied by human biases or business considerations.

The company even claims on its blog, "We do not use human curation to collect or arrange the results on a page." That said, Google adds it cannot divulge just how its search algorithms work because it's currently involved in a very high-stakes conflict with entities who want to game the system for profit.

However, that claim of innocence is not accurate, the WSJ's study found. In fact, over the course of years, Google researchers and engineers have re-tooled and manipulated search results to a much greater degree than company officials have admitted.

The investigation noted that the manipulative actions have very often occurred in response to pressure from companies, various authoritarian governments (like China), and outside interest groups.

"They have increased sharply since the 2016 election and the rise of online misinformation," the paper reported.

Why they can't just be honest: Regulators

Through more than 100 interviews and some of the paper's own testing and analysis of Google search results, the WSJ found:

Google engineers often make adjustments outside the public's view to information the company layers on top of basic search returns including auto-complete suggestions, a knowledge panel boxes, and featured snippets. In addition, news results are not subject to the same company policies that limit what engineers are permitted to alter or remove altogether.

â Though the company has publicly denied that it keeps blacklists of certain sites that have been removed from search results, Google does, indeed, have such lists. In fact, as *Natural News* reported in July, Googleâs vice president of government affairs and public policy, Karan Bhatia, appeared to have lied under oath to Congress [when he denied such lists exist](#).

â In the auto-complete function, Google engineers have manipulated the algorithm to â weed out more incendiary suggestions for controversial topicsâ like abortion and illegal immigration, the WSJ reported. The effect has been to effectively remove any such results altogether.

â Internally, Google employees and founders Sergey Brin and Larry Page have had disagreements about how extensively the company should filter search results. Currently, employees are permitted to seek revision to specific â controversialâ search results for topics including autism and vaccinations.

The results of the Journalâs investigation contradict one of the companyâs primary defenses against global regulators who are increasingly concerned about how the search behemoth uses its power (or abuses it): â That the company doesnât exert editorial control over what it shows users,â the paper reported.

Mostly, regulators have voiced concerns about alleged anticompetitive practices, anti-trust issues, online misinformation, and, of course, Left-wing political bias.

The algorithms the search giant uses are anything but autonomous. In fact, they are regularly altered and changed by executives and engineers who are interested in delivering what they feel are the most â relevantâ results to users. That alone suggests tampering.

At the same time, the manipulation is being done to satisfy the demands of some powerful interests, including governments like China, all in an effort to protect the parent companyâs \$30 billion in annual profits.

So the next time you use Google, think about this: Depending on the subject matter you searched for, youâre probably not getting everything you could be getting. [Thereâs always Good Gopher](#).

Google's chief diversity officer departs in shame

99 [Like](#)

Danielle Brown is leaving Google after serving not-quite 2 years as VP of employee engagement and CDO.

Brown will be joining Gusto as chief people officer. Her [announcement](#), in which she describes Gusto as a company that is all about people, does not mention Google.

Do we smell intrigue?

Possibly. Google's diversity department has been somewhat of a revolving door recently. The last out was [Nancy Lee](#), who attempted to address Google's weak diversity numbers for several years before leaving in 2016.

When she left, she claimed she was retiring, but soon after joined Lime. *Awkward move, Nancy. We literally know everything. Google, probably.*

The tech giant, which has [long faced criticism](#) for its lack of diversity, was thrown into the spotlight shortly after Brown's arrival when a since-fired Google engineer posted [an anti-diversity manifesto](#).

A quick stroll down diversity-and-inclusion-mishap lane

The memo became somewhat of a tipping point for the [inclusion sh*tstorm](#) that's been raging ever since, with complaints and discrimination lawsuits flying on all sides over gender pay gap claims and workplace rights.

There was also a [boycott](#) over military contracts and a 20k-employee walkout over the company's handling of [sexual harassment claims](#) against high-level *googly-eyed* execs.

News of Brown's departure comes shortly after the release of Google's 2018 [diversity reports](#), which garnered a collective meh. The CDO role will be filled by Melonie Parker, who has served as head of diversity for 9 months.

Google's new AMP domain change will hide the fact a website is spied on by (and tracked by) Google

[Dee Rankovic](#)

Google has moved to quietly erase evidence of its involvement from URLs of those websites that implement the company's Accelerated Mobile Pages (AMP) technology.

Instead of showing `https://google.com/amp` in URLs reached through Google's mobile search that deploy AMP, users will now see `real URLs` [TechCrunch is reporting](#).

The change is mostly cosmetic, though, as AMP will continue to host content on Google's cache servers or alternatively, that of other companies such as Google's partners Cloudflare. This obfuscation of the URL is bad news for those who want to know when and where they exit the open internet and enter Google's ad empire built squarely on tracking and data harvesting.

With this AMP update that has been over a year in the making Google said it wanted to address one of the criticisms of the technology, namely, AMP stripping publishers of their brand identity by adding its URL to theirs.

The stated reason behind AMP, however, is to make the world, or at least the web, a better place by speeding up page load times on mobile a goal achieved here with Google's own version of HTML, and cache servers. Since the launch in 2015, AMP has been widely, if grudgingly adopted by online media, but remains controversial as ultimately Google's attempt at lock-in and control of the way content is published online, with the goal of providing the company with more opportunities to monetize through advertising.

RELATED: [Slack has started shutting down groups on the grounds of "hate"](#)

AMP is not much different from similar offerings by major players like Facebook and its Instant Articles, or the recently launched Apple News+ either when it comes to its mission statement, or in the criticism leveled at it.

But there has been another prominent criticism of AMP: the sheer amount of work it adds for those who implement it, not least around the analytics segment. More bad news from this update is that websites will have to put in even more effort: this time to publish both signed and unsigned pages, in order to work around browsers rejecting pages with scripts that come from any place other than the original publisher.

Google's true origin partly lies in CIA and NSA research grants for mass surveillance

They're always watching. (Reuters/Brian Snyder)

SHARE

WRITTEN BY

[Jeff Nesbit](#) Former director of legislative and public affairs, National Science Foundation

December 08, 2017

Two decades ago, the US intelligence community worked closely with Silicon Valley in an effort to track citizens in cyberspace. And Google is at the heart of that origin story. Some of the research that led to Google's ambitious creation was funded and coordinated by a research group established by the intelligence community to find ways to track individuals and groups online.

The intelligence community hoped that the nation's leading computer scientists could take non-classified information and user data, combine it with what would become known as the internet, and begin to create for-profit, commercial enterprises to suit the needs of both the intelligence community and the public. They hoped to direct the supercomputing revolution from the start in order to make sense of what millions of human beings did inside this digital information network. That collaboration has made a comprehensive public-private mass surveillance state possible today.

The story of the deliberate creation of the modern mass-surveillance state includes elements of Google's surprising, and largely unknown, origin. It is a somewhat different creation story than the one the public has heard, and explains what Google cofounders Sergey Brin and Larry Page set out to build, and why.

But this isn't just the origin story of Google: It's the origin story of the mass-surveillance state, and the government money that funded it.

Backstory: The intelligence community and Silicon Valley

In the mid 1990s, the intelligence community in America began to realize that they had an opportunity. The supercomputing community was just beginning to migrate from university settings into the private sector, led by investments from a place that would come to be known as Silicon Valley.

The intelligence community wanted to shape Silicon Valley's efforts at their inception so they would be useful for homeland security

purposes. A digital revolution was underway: one that would transform the world of data gathering and how we make sense of massive amounts of information. The intelligence community wanted to shape Silicon Valley's supercomputing efforts at their inception so they would be useful for both military

and homeland security purposes. Could this supercomputing network, which would become capable of storing terabytes of information, make intelligent sense of the digital trail that human beings leave behind?

Answering this question was of great interest to the intelligence community.

Intelligence-gathering may have been *their* world, but the Central Intelligence Agency (CIA) and the National Security Agency (NSA) had come to realize that their future was likely to be profoundly shaped outside the government. It was at a time when military and intelligence budgets within the Clinton administration were in jeopardy, and the private sector had vast resources at their disposal. If the intelligence community wanted to conduct mass surveillance for national security purposes, it would require cooperation between the government and the emerging supercomputing companies.

To do this, they began reaching out to the scientists at American universities who were creating this supercomputing revolution. These scientists were developing ways to do what no single group of human beings sitting at work stations in the NSA and the CIA could ever hope to do: gather huge amounts of data and make intelligent sense of it.

A rich history of the government's science funding

There was already a long history of collaboration between America's best scientists and the intelligence community, from the creation of the atomic bomb and satellite technology to efforts to put a man on the moon.

The internet itself was created because of an intelligence effort. In fact, the internet itself was created because of an intelligence effort: In the 1970s, the agency responsible for developing emerging technologies for military, intelligence, and national security purposes—the Defense Advanced Research Projects Agency (DARPA)—linked four supercomputers to handle massive data transfers. It handed the operations off to the National Science Foundation (NSF) a decade or so later, which proliferated the network across thousands of universities and, eventually, the public, thus creating the architecture and scaffolding of the World Wide Web.

Silicon Valley was no different. By the mid 1990s, the intelligence community was seeding funding to the most promising supercomputing efforts across academia, guiding the creation of efforts to make massive amounts of information useful for both the private sector as well as the intelligence community.

They funded these computer scientists through an unclassified, highly compartmentalized program that was managed for the CIA and the NSA by large military and intelligence contractors. It was called the Massive Digital Data Systems (MDDS) project.

The Massive Digital Data Systems (MDDS) project

MDDS was introduced to several dozen leading computer scientists at Stanford, CalTech, MIT, Carnegie Mellon, Harvard, and others in a white paper that described what the CIA, NSA, DARPA, and other agencies hoped to achieve. The research would largely be funded and managed by unclassified science agencies like NSF, which would allow the architecture to be scaled up in the private sector if it managed to achieve what the intelligence community hoped for.

Not only are activities becoming more complex, but changing demands require that the IC [Intelligence

Community] process different types as well as larger volumes of data,â the intelligence community said in its [1993 MDDS white paper](#). â Consequently, the IC is taking a proactive role in stimulating research in the efficient management of massive databases and ensuring that IC requirements can be incorporated or adapted into commercial products. Because the challenges are not unique to any one agency, the Community Management Staff (CMS) has commissioned a Massive Digital Data Systems [MDDS] Working Group to address the needs and to identify and evaluate possible solutions.â

Over the next few years, the programâs stated aim was to provide more than a dozen grants of several million dollars each to advance this research concept. The grants were to be directed largely through the NSF so that the most promising, successful efforts could be captured as intellectual property and form the basis of companies attracting investments from Silicon Valley. This type of public-to-private innovation [system](#) helped launch powerful science and technology companies like [Qualcomm](#), [Symantec](#), Netscape, and others, and [funded the pivotal research](#) in areas like Doppler radar and fiber optics, which are central to large companies like AccuWeather, Verizon, and AT&T today. Today, the NSF provides [nearly 90%](#) of all federal funding for university-based computer-science research.

The CIA and NSAâs end goal

The research arms of the CIA and NSA hoped that the best computer-science minds in academia could identify what they called âbirds of a feather:â Just as geese fly together in large V shapes, or flocks of sparrows make sudden movements together in harmony, they predicted that like-minded groups of humans would move together online. The intelligence community named their first unclassified briefing for scientists the [âbirds of a featherâ briefing](#), and the âBirds of a Feather Session on the Intelligence Community Initiative in Massive Digital Data Systemsâ took place at the Fairmont Hotel in San Jose in the spring of 1995.

The intelligence community named their first unclassified briefing for scientists the âbirds of a featherâ briefing.

Their research aim was to track digital fingerprints inside the rapidly expanding global information network, which was then known as the World Wide Web. Could an entire world of digital information be organized so that the requests humans made inside such a network be tracked and sorted? Could their queries be linked and ranked in order of importance? Could âbirds of a featherâ be identified inside this sea of information so that communities and groups could be tracked in an organized way?

By working with emerging commercial-data companies, their intent was to track like-minded groups of people across the internet and identify them from the digital fingerprints they left behind, much like forensic scientists use fingerprint smudges to identify criminals. Just as âbirds of a feather flock together,â they predicted that potential terrorists would communicate with each other in this new global, connected worldâ and they could find them by identifying patterns in this massive amount of new information. Once these groups were identified, they could then follow their digital trails everywhere.

Sergey Brin and Larry Page, computer-science boy wonders

In 1995, one of the first and most promising MDDS grants went to a computer-science research team at Stanford University with a decade-long history of working with NSF and DARPA grants. The [primary objective of this grant](#) was âquery optimization of very complex queries that are described using the

â query flocksâ approach.â A second grantâ the DARPA-NSF grant most closely associated with Googleâ s originâ was part of a coordinated effort to build a massive digital library using the internet as its backbone. Both grants funded research by two graduate students who were making rapid advances in web-page ranking, as well as tracking (and making sense of) user queries: future Google cofounders Sergey Brin and Larry Page.

The research by Brin and Page under these grants became the heart of Google: people using search functions to find precisely what they wanted inside a very large data set. The intelligence community, however, saw a slightly different benefit in their research: Could the network be organized so efficiently that individual users could be uniquely identified and tracked?

This process is perfectly suited for the purposes of counter-terrorism and homeland security efforts: Human beings and like-minded groups who might pose a threat to national security can be uniquely identified online before they do harm. This explains why the intelligence community found Brinâ s and Pageâ s research efforts so appealing; prior to this time, the CIA largely used human intelligence efforts in the field to identify people and groups that might pose threats. The ability to track them virtually (in conjunction with efforts in the field) would change everything.

It was the beginning of what in just a few yearsâ time would become Google. The two intelligence-community managers charged with leading the program [met regularly](#) with Brin as his research progressed, and he was [an author](#) on several other research papers that resulted from this MDDS grant before he and Page left to form Google.

The grants allowed Brin and Page to do their work and contributed to their breakthroughs in web-page ranking and tracking user queries. Brin didnâ t work for the intelligence communityâ or for anyone else. Google had not yet been incorporated. He was just a Stanford researcher taking advantage of the grant provided by the NSA and CIA through the unclassified MDDS program.

Left out of Googleâ s story

The MDDS research effort has never been part of Googleâ s origin story, even though the principal investigator for the MDDS grant [specifically named](#) Google as directly resulting from their research: â Its core technology, which allows it to find pages far more accurately than other search engines, was partially supported by this grant,â [he wrote](#). In a [published research paper](#) that includes some of Brinâ s pivotal work, the authors also reference the NSF grant that was created by the MDDS program.

Instead, every Google creation story only mentions just one federal grant: [the NSF/DARPA â digital librariesâ grant](#), which was designed to allow Stanford researchers to search the entire World Wide Web stored on the universityâ s servers at the time. â The development of the Google algorithms was carried on a variety of computers, mainly provided by the NSF-DARPA-NASA-funded Digital Library project at Stanford,â Stanfordâ s Infolab [says of its origin](#), for example. NSF likewise [only references the digital libraries grant](#), not the MDDS grant as well, in its own history of Googleâ s origin. In the [famous research paper](#), â The Anatomy of a Large-Scale Hypertextual Web Search Engine,â which describes the creation of Google, Brin and Page thanked the NSF and DARPA for its digital library grant to Stanford. But the grant from the intelligence communityâ s MDDS programâ specifically designed for the breakthrough that Google was built uponâ has faded into obscurity.

Google has said in the past that it was not funded or created by the CIA. For instance, when [stories circulated](#) in 2006 that Google had received funding from the intelligence community for years to assist in counter-terrorism efforts, the company told Wired magazine founder John Battelle, â [The statements related to Google are completely untrue](#).â

Did the CIA directly fund the work of Brin and Page, and therefore create Google? No. But were Brin and Page researching precisely what the NSA, the CIA, and the intelligence community hoped for, assisted by their grants? Absolutely.

The CIA and NSA funded an unclassified, compartmentalized program designed from its inception to spur something that looks almost exactly like Google. To understand this significance, you have to consider what the intelligence community was trying to achieve as it seeded grants to the best computer-science minds in academia: The CIA and NSA funded an unclassified, compartmentalized program designed from its inception to spur the development of something that looks almost exactly like Google. Brin's breakthrough research on page ranking by tracking user queries and linking them to the many searches conducted—essentially identifying a bird of a feather—was largely the aim of the intelligence community's MDDS program. And Google succeeded beyond their wildest dreams.

The intelligence community's enduring legacy within Silicon Valley

[Digital privacy concerns](#) over the intersection between the intelligence community and commercial technology giants [have grown in recent years](#). But most people still don't understand the degree to which the intelligence community relies on the world's biggest science and tech companies for its counter-terrorism and national-security work.

Civil-liberty advocacy groups have aired their privacy concerns for years, especially as they now relate to the Patriot Act. Hastily passed 45 days after 9/11 in the name of national security, the Patriot Act was the first of many changes to surveillance laws that made it easier for the government to spy on ordinary Americans by expanding the authority to monitor phone and email communications, collect bank and credit reporting records, and track the activity of innocent Americans on the Internet, [says the ACLU](#). While most Americans think it was created to catch terrorists, the Patriot Act actually turns regular citizens into suspects.

When asked, the biggest technology and communications companies—from Verizon and AT&T to Google, Facebook, and Microsoft—say that they never deliberately and proactively offer up their vast databases on their customers to federal security and law enforcement agencies: They say that [they only respond to subpoenas or requests](#) that are filed properly under the terms of the Patriot Act.

But even a cursory glance through recent public records shows that there is a treadmill of constant requests that could undermine the intent behind this privacy promise. According to the data-request records that the companies make available to the public, in the most recent reporting period between 2016 and 2017, local, state and federal government authorities seeking information related to national security, counter-terrorism or criminal concerns issued [more than 260,000 subpoenas, court orders, warrants, and other legal requests](#) to Verizon, more than [250,000 such requests](#) to AT&T, and nearly [24,000 subpoenas, search warrants, or court orders](#) to Google. Direct national security or counter-terrorism requests are a small fraction of this overall group of requests, but the Patriot Act legal process has now become so routinized that the companies each have a group of employees who simply take care of the stream of requests.

In this way, the collaboration between the intelligence community and big, commercial science and tech companies has been wildly successful. When national security agencies need to identify and track people and groups, they know where to turn and do so frequently. That was the goal in the beginning. It has succeeded perhaps more than anyone could have imagined at the time.

Google's blacklisting of pro-America websites is proof of illegal election rigging by the evil tech giant

: [JD Heyes](#)

Tags: [algorithms](#), [Big Tech](#), [blacklists](#), [Censorship](#), [deception](#), [denials](#), [editorial control](#), [engineers](#), [Google](#), [investigation](#), [Left-wing](#), [lies](#), [manipulation](#), [political bias](#), [real investigations](#), [research](#), [search algorithms](#), [search results](#), [thought control](#)

([Natural News](#)) Officials at tech behemoth Google have alternately claimed the company doesn't manipulate searches, improperly curate results, or keep a blacklist of sites that it either buries or bans altogether.

But a new report from [The Wall Street Journal](#) involving extensive analysis and research found that in reality, the company does all three of those things.

The paper notes:

Twenty years ago, Google founders began building a goliath on the premise that its search algorithms could do a better job combing the web for useful information than humans. Google executives have said repeatedly in private meetings with outside groups and in congressional testimony that the algorithms are objective and essentially autonomous, unsullied by human biases or business considerations.

The company even claims on its blog, "We do not use human curation to collect or arrange the results on a page." That said, Google adds it cannot divulge just how its search algorithms work because it's currently involved in a very high-stakes conflict with entities who want to game the system for profit.

However, that claim of innocence is not accurate, the WSJ's study found. In fact, over the course of years, Google researchers and engineers have re-tooled and manipulated search results to a much greater degree than company officials have admitted.

The investigation noted that the manipulative actions have very often occurred in response to pressure from companies, various authoritarian governments (like China), and outside interest groups.

"They have increased sharply since the 2016 election and the rise of online misinformation," the paper reported.

Why they can't just be honest: Regulators

Through more than 100 interviews and some of the paper's own testing and analysis of Google search results, the WSJ found:

Google engineers often make adjustments outside the public's view to information the company layers on top of basic search returns including auto-complete suggestions, a knowledge panel boxes, and featured snippets. In addition, news results are not subject to the same company policies that limit what engineers are permitted to alter or remove altogether.

â Though the company has publicly denied that it keeps blacklists of certain sites that have been removed from search results, Google does, indeed, have such lists. In fact, as *Natural News* reported in July, Googleâs vice president of government affairs and public policy, Karan Bhatia, appeared to have lied under oath to Congress [when he denied such lists exist](#).

â In the auto-complete function, Google engineers have manipulated the algorithm to â weed out more incendiary suggestions for controversial topicsâ like abortion and illegal immigration, the WSJ reported. The effect has been to effectively remove any such results altogether.

â Internally, Google employees and founders Sergey Brin and Larry Page have had disagreements about how extensively the company should filter search results. Currently, employees are permitted to seek revision to specific â controversialâ search results for topics including autism and vaccinations.

The results of the Journalâs investigation contradict one of the companyâs primary defenses against global regulators who are increasingly concerned about how the search behemoth uses its power (or abuses it): â That the company doesnât exert editorial control over what it shows users,â the paper reported.

Mostly, regulators have voiced concerns about alleged anticompetitive practices, anti-trust issues, online misinformation, and, of course, Left-wing political bias.

The algorithms the search giant uses are anything but autonomous. In fact, they are regularly altered and changed by executives and engineers who are interested in delivering what they feel are the most â relevantâ results to users. That alone suggests tampering.

At the same time, the manipulation is being done to satisfy the demands of some powerful interests, including governments like China, all in an effort to protect the parent companyâs \$30 billion in annual profits.

So the next time you use Google, think about this: Depending on the subject matter you searched for, youâre probably not getting everything you could be getting. [Thereâs always Good Gopher](#).

Google's chief diversity officer departs in shame

99 [Like](#)

Danielle Brown is leaving Google after serving not-quite 2 years as VP of employee engagement and CDO.

Brown will be joining Gusto as chief people officer. Her [announcement](#), in which she describes Gusto as a company that is all about people, does not mention Google.

Do we smell intrigue?

Possibly. Google's diversity department has been somewhat of a revolving door recently. The last out was [Nancy Lee](#), who attempted to address Google's weak diversity numbers for several years before leaving in 2016.

When she left, she claimed she was retiring, but soon after joined Lime. *Awkward move, Nancy. We literally know everything. Google, probably.*

The tech giant, which has [long faced criticism](#) for its lack of diversity, was thrown into the spotlight shortly after Brown's arrival when a since-fired Google engineer posted [an anti-diversity manifesto](#).

A quick stroll down diversity-and-inclusion-mishap lane

The memo became somewhat of a tipping point for the [inclusion sh*tstorm](#) that's been raging ever since, with complaints and discrimination lawsuits flying on all sides over gender pay gap claims and workplace rights.

There was also a [boycott](#) over military contracts and a 20k-employee walkout over the company's handling of [sexual harassment claims](#) against high-level *googly-eyed* execs.

News of Brown's departure comes shortly after the release of Google's 2018 [diversity reports](#), which garnered a collective meh. The CDO role will be filled by Melonie Parker, who has served as head of diversity for 9 months.

Google's new AMP domain change will hide the fact a website is spied on by (and tracked by) Google

[Dee Rankovic](#)

-
-
-

Google has moved to quietly erase evidence of its involvement from URLs of those websites that implement the company's Accelerated Mobile Pages (AMP) technology.

Instead of showing `https://google.com/amp` in URLs reached through Google's mobile search that deploy AMP, users will now see `real URLs` [TechCrunch is reporting](#).

The change is mostly cosmetic, though, as AMP will continue to host content on Google's cache servers or alternatively, that of other companies such as Google's partners Cloudflare. This obfuscation of the URL is bad news for those who want to know when and where they exit the open internet and enter Google's ad empire built squarely on tracking and data harvesting.

With this AMP update that has been over a year in the making Google said it wanted to address one of the criticisms of the technology, namely, AMP stripping publishers of their brand identity by adding its URL to theirs.

The stated reason behind AMP, however, is to make the world, or at least the web, a better place by speeding up page load times on mobile a goal achieved here with Google's own version of HTML, and cache servers. Since the launch in 2015, AMP has been widely, if grudgingly adopted by online media, but remains controversial as ultimately Google's attempt at lock-in and control of the way content is published online, with the goal of providing the company with more opportunities to monetize through advertising.

RELATED: [Slack has started shutting down groups on the grounds of "hate"](#)

AMP is not much different from similar offerings by major players like Facebook and its Instant Articles, or the recently launched Apple News+ either when it comes to its mission statement, or in the criticism leveled at it.

But there has been another prominent criticism of AMP: the sheer amount of work it adds for those who implement it, not least around the analytics segment. More bad news from this update is that websites will have to put in even more effort: this time to publish both signed and unsigned pages, in order to work around browsers rejecting pages with scripts that come from any place other than the original publisher.

DAMORE DROPS HIS BOMB ON GOOGLE

[January 09, 2018](#) [Google](#) , [James Damore](#) , [legal news](#) , [Science & Culture](#)

James Damore, the ex-Google employee [fired from his job](#) for daring to draft a memo with an opinion that gently demurred from Google's diversity Koolaid groupthink and for being a "cisgender White male," has now officially filed a legal complaint against his ex-employers for discrimination.

This puts the wheels in motion for what promises to be a landmark legal case that could cost Google hundreds of millions in punitive damages.

The application to sue the social media giant before a jury -- made along with David Gudeman, another victim of Google's Orwellian attitude to "non-diverse" employees -- has been filed at the Superior Court of California, and makes some damning claims against the company, whose net value is estimated at over \$500 billion.

The complaint part of the petition makes some interesting reading:

"Plaintiffs bring this individual and class action on behalf of themselves and on behalf of a class and subclasses defined as all employees of Google discriminated against due to their perceived conservative political...due to their male gender by Google...due to their Caucasian race...

Throughout the Class Periods, and in violation of California law, Google employees who expressed views deviating from the majority view at Google on political subjects raised in the workplace and relevant to Google's employment policies and its business, such as its diversity hiring policies, its bias sensitivity, or its social justice, were/are singled out, mistreated, and systematically punished and terminated from Google, in violation of their legal rights.

Google's open hostility for conservative thought is paired with invidious discrimination on the basis of race and gender, barred by law. Google's management goes to extreme and illegal lengths to encourage hiring managers to take protected categories such as race and/or gender into consideration as determinative hiring factors, to the detriment of Caucasian and male employees and potential employees at Google.

Damore, Gudeman, and other class members were ostracized, belittled, and punished for their heterodox political views, and for the added sin of their birth circumstances of being Caucasians and/or males. This is the essence of discrimination. Google formed opinions about and then treated Plaintiffs not based on their individual merits, but rather on their membership in groups with assumed characteristics."

You can read the full document [HERE](#).

It's a little troubling that White males have to resort to the mindset and rhetoric of "victim groups" and "victimology" to assert their basic rights, but we should definitely welcome anything that can push Google to behaving in a less politically biased way and more like the *de facto* monopoly and public utility it is. A payment of several tens of millions of dollars or even hundreds of millions of dollars to Damore and Gudeman would go a long way to accomplishing that.

Google CEO Faces Hot Seat in Washington

Sundar Pichai expected to face questions about the company's handling of data, China strategy and perceived political leanings

Google CEO Sundar Pichai arrives to the White House for a meeting in Washington, D.C., on Dec. 6. Mr. Pichai will testify at his first Congressional hearing on Tuesday. Photo: Andrew Harrer/Bloomberg News

[0 Comments](#)

By

Douglas MacMillan and

John D. McKinnon Dec. 10, 2018 8:00 a.m. ET

Sundar Pichai is a hero among many engineers in Silicon Valley, where he helped build some of Google's most popular products and climbed the ladder to the top of the internet giant.

In Washington, he's a relative nobody.

Mr. Pichai will be thrust into the political spotlight when he testifies at his first Congressional hearing on Tuesday. Members of the U.S. House Judiciary Committee are expected to grill the executive on a range of topics, including Google's handling of user data and its development of a search engine that would comply with China's strict internet censors. He agreed to GOP requests to appear before the committee prior to the 2018 election.

For Mr. Pichai, a former semiconductor engineer who has shied away from public appearances for most of his three years as CEO of Google, a unit of [Alphabet Inc.](#), [GOOGL +0.07%](#) the Washington visit will test his ability to take on a new role as the public face of a company increasingly confronting harsh regulatory scrutiny.

“It remains to be seen whether he can step up and be the kind of diplomat and statesman Google requires him to be,” said Arun Sundararajan, a business professor at New York University. “He has, for most of his career, been a product guy.”

Google faces the prospect of regulations that could make it costlier to operate an online ad business expected to generate more than \$100 billion this year. Lawmakers have held hearings in recent months discussing the need for stronger federal protections governing the collection of online data and state attorneys general have begun coordinating a legal strategy to confront tech firms on alleged antitrust violations and over what some Republicans say is a suppression of conservative speech.

- [Google's Empty Chair Gets Starring Role at Hearing](#) (Sept. 5)

Mr. Pichai, 46, joined Google in 2004 and ascended the company's ranks, spearheading the successful Chrome web browser and overseeing the expansion of the Android operating system. When the company reorganized Google [as a division of Alphabet in 2015](#), Mr. Pichai was named CEO of the key strategic business that includes search, YouTube and online ads.

The executive's relative inexperience in Washington contrasts with his predecessor Eric Schmidt, who, during a 10-year stint as Google's CEO from 2001 to 2011, cultivated powerful political allies such as former President Barack Obama and held sway with both parties in Congress. During the Obama years, Google defeated an antitrust probe by U.S. regulators and secured favorable policies on net neutrality, online liability and copyright issues.

Mr. Pichai came to this country as an immigrant with no resources and rose to lead one of the most powerful and influential companies, said Rep. Ro Khanna, a Democrat whose district in California includes Google's headquarters of Mountain View.

Of course he's not going to have a network in Washington, he added. He hasn't played the political game. I think that's refreshing.

Mr. Pichai has been working to build stronger alliances with GOP lawmakers and conservative-leaning groups, according to internal company discussions. In a companywide conference call with employees earlier this year, a top Google public policy executive said that Mr. Pichai has pushed the Washington office to make more friends on the right and occasionally pitched in on the effort, like when he traveled to Tennessee in February to attend a groundbreaking of a new data center with GOP Sen. Bob Corker.

Since the GOP's electoral sweep in 2016, one of the directives we've gotten very clearly from Sundar in his leadership is to build deeper relationships with conservatives, said the executive, Adam Kovacevich, according to a recording reviewed by The Wall Street Journal. That's because of the perception in Washington that Google and its employees lean to the left.

Google didn't respond to a request for comment.

Google angered lawmakers on both sides of the aisle in September, when the company failed to send top leaders to appear at a Senate hearing which featured [Facebook](#) Inc.'s operating chief and [Twitter](#) Inc.'s CEO. Google's absence was [noted by an empty chair with a placard](#) bearing the company's name.

Later that month, Mr. Pichai traveled to Washington to meet with House Republican leaders as well as President Trump's top economic adviser, Larry Kudlow. House Majority Leader Kevin McCarthy (R., Calif.) praised Mr. Pichai for his visit, and the White House described Mr. Kudlow's talks as positive and productive.

At the hearing Tuesday, lawmakers will attempt to pin down Google's CEO on several issues where they say the company hasn't been transparent with the public.

Mr. McCarthy has said Google needs to explain why it failed to disclose a privacy flaw in its Google+ social network which exposed the personal data of hundreds of thousands of users. The company discovered the problem in March but didn't discuss it publicly until after [The Wall Street Journal reported it in October](#).

Mr. Pichai will also likely be asked to clearly explain the company's plans for China. The executive has at times defended the company's possible return to the country and at others questioned whether a search engine is the right product for the company to launch there.

House GOP members may also return to their concerns around Google's alleged political bias. [Leaked emails recently showed](#) that some of the company's employees discussed altering Google's search function to undermine conservative ideas and policies, including President Trump's controversial travel ban. Google has said that none of the proposals to alter the search function was ever implemented.

Democrats are generally skeptical of claims that tech companies are biased against conservatives. Their questions are likely to focus more on privacy, competition and other issues.

Google CEO Secretly Met Pentagon Leaders Over Creepy AI Project

Â© AFP 2018 / Philippe Huguen

[US](#)

[150](#)

MOSCOW (Sputnik) â Sundar Pichai, the CEO of tech giant Google, held a quiet meeting at the US Department of Defense (DoD) seeking to ease tensions with the authorities over the companyâs planned withdrawal from the project on providing the Pentagon with artificial intelligence (AI) tools for analyzing drone footage, local media reported.

Pichai held talks with a group of civilian and military leaders from the office of the Under Secretary of Defense for Intelligence, which is in charge of overseeing the drone project, dubbed Project Maven, last week, the Washington Post newspaper reported on Friday, citing two people familiar with the meeting, speaking on the conditions of anonymity.

According to the outlet, a spokesperson for Google has not provided an immediate comment on the issue while a Pentagon spokesperson said the DoD did not comment on officialsâ private meetings.

READ MORE: [Google Has Dropped Out for Now, But Lethal AI 'Inevitable'](#)

In June, the Gizmondo science news outlet reported that the high-tech company did not plan to renew its contract on Project Maven after it expires in 2019.

[If Google Drops Project Maven. â Pentagon Will Try to Strike Back at Themâ](#) The reported decision followed the move by over 3,000 Google employees to launch a petition asking Pichai to pull out of the project since Google should not be involved in the business of war. The withdrawal also provoked criticism by US congressmen.

In June, Pichai set new strict ethical guidelines for the company which ban the use of AI technology in weapons.

Over the past years, various scientists, engineers, inventors, and human rights activists have called for a ban on the development of Lethal Autonomous Weapons Systems (LAWS) technology and use of AI in weapons.

Google CEO Sundar Pichai Lies And Claims Employees Cant Manipulate Algorithms and Arent Biased

Alex

Wong/ Getty 11 Dec 2018 [2126](#)

5:33

After Rep. Lamar Smith (R-TX) asked Google CEO Sundar Pichai about reports of Google's bias against conservatives during Pichai's hearing in front of the House Judiciary Committee, Tuesday, Pichai denied any bias, dodged questions, and claimed human employees were unable to manipulate algorithms.

Google has revolutionized the world, though not entirely in the way I expected. Americans deserve the facts objectively reported," declared Rep. Smith. "The muting of conservative voices by platforms has intensified, especially during the presidency of Donald Trump. More than 90 percent of all Internet searches take place on Google or its subsidiary YouTube, and they are curating what we see."

Google has long faced criticism for manipulating search results to censor conservatives. Conservative individuals and organizations have had their pro-Trump content tagged as "hate speech," or had their

content reduced in search results. An enforcement of immigration laws has been tagged as hate speech as well. Such actions pose a grave threat to our democratic forum of government," he continued. "PJ Media found that 96 percent of search results for Trump were from liberal media outlets. In fact, not a single right-leaning site appeared on the first page of search results. This doesn't happen by accident, but is baked into the algorithms. Those who write the algorithms get the results they must want, and apparently, management allows it. Dr. Robert Epstein, a Harvard-trained psychologist authored a study recently that showed Google's bias likely swung 2.6 million votes to Hillary Clinton in the 2016 election. Google could well elect the next president with dire implications for our democracy. This should be a real concern to all but the most politically partisan. Those at the top set the tone. It will require a Herculean effort by the Chief Executive and senior management to change the political bias now programmed into the company's culture."

[Trump Claims Protesters In France Are Chanting 'We Want Trump!'](#)

Smith then asked, "In your opening statement you mentioned your desire to provide information that was without political bias. Clearly that's not working. So, what are you going to do to improve that situation?"

"Some of the studies you mention, we have investigated those! We found issues with the methodology and the sample sizes and so on, but let me step back and say providing users high quality and trusted information is sacrosanct to us," replied Pichai. "It's what our principles are, under business interests, our natural long-term incentives are aligned with that. We want to serve users everywhere and we need to earn their trust in doing so."

The two then continued to have a back and forth conversation about Google's bias, which resulted in Pichai dodging most of the questions and denying human employees can manipulate algorithms.

Pichai said, "It is not possible for an individual employee or groups of employees to manipulate our search results. We have a robust framework, including many steps in the process." Smith disagreed, saying: "I disagree, I think humans can manipulate the process. It is a human process at its base."

SMITH: "So what actions are you going to take to try to counter the political bias and some of those examples I just gave? I mean, they're irrefutable, so it occurs, you have to take some responsibility for that bias. What do you intend to do about it?"

PICHAIR: "Congressman, with respect, Dr. Epstein's study, we have investigated. We don't agree with the methodology! When we look at it we evaluate our search results. Today we use a very robust methodology and we have been doing this for twenty years. Making sure the results are accurate is something we need to do and we work hard to do that."

SMITH: "What does methodology have to do with the fact that 96 percent of the references to Trump are from liberal media?"

PICHAIR: "There are always studies that can show one set of data and arrive with conclusions, but we have looked at results on our top news category, we find that we have a wide variety of sources, including sources from the left and sources from the right, and we are committed to make sure there's diverse perspectives."

SMITH: "By the way, the study I referred to was done by a self-proclaimed Democrat who voted for Hillary Clinton and said he regretted to find what he found but he felt it was irrefutable and no one has been able to disprove him! Clearly there may be a difference of opinion as to the degree or amount of political bias. Would you allow an independent entity to study your search results for political bias?"

PICHAJ: â Congressman, if I may make two points. One is, today there have been independent third-party studies looking at Search resultsâ

SMITH: â But you chose those third parties. Iâm talking about someone truly independent.

PICHAJ: â We didnât choose those third parties. They completed those studies. Second is, we are transparent as to how we evaluate Search. We publish our[â] guidelines. We publish it externallyâ We are trying hard to understand what users want, and this is something important for us to get right.

SMITH: â To my knowledge, youâve never sanctioned any employee for manipulating search results whatsoever. Is that the case?

PICHAJ: â It is not possible for an individual employee or groups of employees to manipulate our search results. We have a robust framework, including many steps in the process.

SMITH: â I disagree, I think humans can manipulate the process. It is a human process at its base.

Google CEO slammed by lawmakers for declining to testify at Senate hearing

By [Andrew O'Reilly](#) |

- [Facebook](#)
- [Twitter](#)
- [Flipboard](#)
- [Comments](#)
- [Print](#)
- [Email](#)

Google CEO Sundar Pichai will not testify on Sept. 5 before the Senate Intelligence Committee, according to reports. (REUTERS, File)

On the same day that President Trump slammed social media companies for what he claimed was a bias against conservative media, a bipartisan group of lawmakers went after Google's CEO for refusing to testify next week on Capitol Hill.

Google CEO Sundar Pichai drew widespread criticism from senators of both parties after it was announced that he would not testify on Sept. 5 before the Senate Intelligence Committee, but instead would send Kent Walker, the company's senior vice president for global affairs, to the hearing.

"This is the United States Senate, this is an important issue, and we deserve to hear from the decision-makers, not the people who carry out the decisions," said Sen. Angus King, a Maine independent who caucuses with Democrats, [according to Bloomberg](#).

Sen. Richard Burr, R-N.C., who chairs the committee, said that Walker was not sufficiently high up in the tech company to provide testimony before Congress, but backed away from issuing a subpoena for Pichai to appear.

More on this...

- [Google Denies Donald Trump's Claims Of Left-Wing Bias: Search Is Not Used To Set A Political Agenda](#)
- [Trump threatens Google over alleged biased search results](#)
- [Google says Russians bought \\$100K in ads for Trump. Bernie Sanders: Report](#)

"I don't normally subpoena people to be part of the solution," Burr said. "Google chooses not to participate and being part of the solution. That's a decision they made."

Twitter CEO Jack Dorsey and Facebook's Chief Operating Officer Sheryl Sandberg have confirmed that they will be in Washington for the hearing.

The news of the bipartisan anger at Pichai's declining to testify caps off a rough day for Google, after Trump launched an attack on the company with an early morning tweet accusing the tech giant's search engine of being biased against conservative media and promising that the situation will be addressed.

Trump reiterated his warning Tuesday afternoon in the Oval Office, saying the companies are taking advantage of people and warning them to be careful.

.

They better be careful because you can't do that to people, Trump told reporters following a meeting with officials from FIFA. Google, Twitter and Facebook are treading on really troubled territory.

Google has denied ranking results to "manipulate" political sentiment and said the company constantly works on its algorithms to ensure users get the highest quality content on the web.

"When users type queries into the Google Search bar, our goal is to make sure they receive the most relevant answers in a matter of seconds," a Google spokesperson said in a statement. "Search is not used to set a political agenda and we don't bias our results toward any political ideology. Every year, we issue hundreds of improvements to our algorithms to ensure they surface high-quality content in response to users' queries. We continually work to improve Google Search and we never rank search results to manipulate political sentiment."

This is the first time Trump raised the issue of Google search engine's alleged bias. Just weeks ago, Trump attacked other tech giants such as Twitter and Facebook for silencing non-left wing voices, saying too many voices are being destroyed and pledged to address the problem.

Facebook and Twitter have been under fire for allegedly censoring conservative and Republican accounts on their platforms, while taking a more lenient approach to liberal and left-wing users.

The president previously pointed to the problem of so-called shadow banning on social media platforms, where users, while technically not banned, found their posts invisible to most users.

A Google query for "Trump News" Tuesday afternoon, following the president's remarks, showed stories from CNN, The New York Times, Fox News and the Wall Street Journal, among others.

.

Trump and some supporters have long accused Silicon Valley companies of being biased against them. But, while some company executives may lean liberal, they have long asserted that their products are without political bias, and indeed no such bias has been proven.

Trump didn't say what he based his tweets on. But in a blog post over the weekend, conservative activist Paula Boylard had said she found "blatant prioritization of left-leaning and anti-Trump media outlets" in search results.

Boylard based her judgments on which media outlets were left- or right-leaning on a list by Sharyl Attkisson, host of Sinclair Television's "Full Measure" and author of "The Smear: How Shady Political Operatives and Fake News Control What You See, Think, and How You Vote." Sinclair is a significant outlet for conservative views.

Fox News' Lukas Mikelionis, Bradford Betz and The Associated Press contributed to this report.

Google Caught Red-Handed Censoring Search Results For The DNC

When searching for terms that challenged the official narrative of the Parkland shooting, the results on Google varied drastically, compared to other search engines.

Google may be the world's most popular search engine, but it has also been the subject of a number of accusations in recent years that it is purposefully censoring searches and influencing results. In the case of search results related to the Parkland shooting, that alleged influence is becoming even more apparent.

This week, the staff at The Free Thought Project began testing various keywords related to the Parkland shooting on different search engines, and we noticed that if our search terms were controversial, the first page of Google results was filled with entirely different information than the other search engines. The information showed on Google was often not relevant to our search, and the results always seemed to support the official narrative.

The most striking of these results came when we searched for the words “girl says 3 shooters parkland,” expecting the [news footage](#) of an eyewitness from the school saying that there were multiple shooters.

On Google this video did not come up, nor did any articles about the statement that the student made to the news, despite the fact that our search was extremely specific. Don’t be fooled by the top article “*Calling B.S in Parkland, Florida*,” it is an op-ed promoting gun control.

Oddly enough, when we searched for the same keywords on Yahoo, Bing or Duck Duck Go, each search engine brought up exactly what we were seeking. Try this experiment yourself and see what you come up with. It does not just have to be for this story—if you find other stories and search terms that Google appears to be suppressing, let us know. Below are screenshots from Duck Duck Go and Bing. We did not post Yahoo

because their results were identical to Bing.

Google

became the most popular search engine on the web because it connected people with the links that were close to their searches while offering up a wide variety of different sources. But now it is obviously far past time to move onto more trusted platforms.

In the early days of the internet, search engines and service providers like youtube acted as a gateway to the world. But over the years the most powerful of these companies have increasingly begun to act as gatekeepers, caving into pressure from the government.

In the last two years, censorship on the internet has been brought to an all-time high, thanks to a fake news hysteria and a consistent campaign from the mainstream media to silence dissenting voices during times of tragedy when the official story has come into question like the recent shootings in Las Vegas or Parkland.

Instead of investigating stories and asking tough questions, the mainstream media simply regurgitate press releases from police and government agencies. Before the internet gave birth to the alternative media there was only one side to every news story, **the official narrative**, and for the most part, everyone believed it. Even if news outlets have partisan disagreements about politics, they always sell the basic version of reality, especially when it comes to questioning information handed down from those in authority.

As the alternative media has grown in size and relevance in recent years, there has become a wide range of perspectives for people to choose from, and there is no longer just one side to the story when large news

events happen. Now there are many different investigations and theories behind every eventâ from the brilliant to the insaneâ leaving it up to the reader to use their own critical thinking when reading this news.

Critics see this as some type of breakdown of reality, where everyone just adopts whatever version of the world that suits their needs. While this is a legitimate problem that does happen to some extentâ in the case of online echo chambers and actual fake newsâ these things are far less dangerous than allowing an all-powerful media cartel to think for us.

Google Caught Rigging Searches Again: Fined \$21 Million By India For Search Bias

SHARE

[Facebook](#)

[Twitter](#)

google, it seems, is finding it hard to resist the temptation to misuse its near monopolistic hold in the search domain. After being [fined for a record 2.42 billion](#) by the European Competition Commission for favouring their own comparison shopping service, the search giant has run into trouble with Indian authorities this time.

Competition Commission of India, the watchdog of fair competition in India, had found Google routing the flight-related queries towards its own flight search service. The CCI said the company has abused its dominant position on three counts largely pertaining to search, in its 190-page order on Thursday. This practice directly harms the competitors (start-ups the most) and is unfair to the consumers as well.

A penalty of 5% of average revenue generated from India over three years from FY12 to FY15, amounting to \$21 million, has to be deposited within 60 days. The penalty can increase up to 10% as stipulated under the country's competition laws. The complaint was prompted by Matrimony.com and Consumer Unity & Trust Society (CUTS) in 2012 against Google LLC, Google India Pvt. Ltd. and Google Ireland Ltd. for abusing its dominant position to suppress the competition.

In response to CCI order, Google said: â The Competition Commission of India has confirmed that, on the majority of issues it examined, our conduct complies with Indian competition laws.â

The allegations of competition malpractices against Google has been increasing of late and the startups which used to look up to Google as *The Platform* are now concerned. Google has revolutionised the information access system globally. Its effort to evolve along with the growing needs of the users is commendable, however, it is to be seen that the giant does not stifle the growing entrepreneurs. After all, power corruptsâ !

[Daily trips to the sauna could reduce your risk of stroke](#)

[Ecstasy may help treat PTSD](#)

Mobile phones may be behind a surge in a deadly brain tumor, scientists say.

Cases of glioblastoma in England soared from 983 to 2,531 between 1995 and 2015, figures from the Office of National Statistics reveal.

The rise was across all age groups and came as cases of lower-grade tumors fell.

Experts say "widespread environmental or lifestyle factors" are likely to be responsible for the trend, with mobile phones a potential suspect. The findings are [published in the Journal of Public Health and Environment](#).

Study leader Alasdair Philips, of Children with Cancer UK, said: "We found a sustained and highly significant increase in GBM throughout the 21 years and across all ages.

"Interestingly, we found the highest rise in incidence in frontal and temporal regions of the brain. This raises the suspicion that mobile and cordless phone use may be promoting gliomas."

Professor Denis Henshaw said: "Our findings illustrate the need to look more carefully at the mechanisms behind these cancer trends instead of focusing only on cures."

Typically, only a third of patients are still alive two years after being diagnosed with glioblastoma.

Most survive just 14.6 months.

Trigger
iStockphoto

But critics warn the study only identifies a trend in tumor diagnosis rates and does not provide sufficient evidence that mobiles are to blame.

Keith Neal, from the University of Nottingham, said: “The suggestion that mobile phone use is responsible cannot be substantiated. The rise is greatest in the over 55s, who use mobile phones much less and there was very little mobile phone use in 1995 when rates are already increasing.”

David Spiegelhalter, from University of Cambridge, said: “Many things have changed over the last 30 years and so the strong causal conclusions seem unjustified.”

And Lion Shahab, from University College London, said: “This paper provides evidence for a rise in specific malignant brain tumors in England. What the analysis does not show is that this rise is caused by mobile phones.”

Google's Chrome Is Scanning All The Files on Your Computer

Cybersecurity experts and regular users were surprised to learn about a Chrome tool that scans Windows computers for malware and anti-DNC political phrases.

- SHARE
- TWEET

Image: [pixinoo/Shutterstock](#)

The browser you likely use to read this article scans practically all files on your Windows computer. And you probably had no idea until you read this. Don't worry, you're not the only one.

Last year, Google [announced some upgrades](#) to Chrome, [by far](#) the world's most used browser and the one security pros often recommend. The company promised to make internet surfing on Windows computers even a cleaner and a safer adding what [The Verge](#) called a basic antivirus features. What Google did was improve something called [Chrome Cleanup Tool](#) for Windows users, using software [from cybersecurity and antivirus company ESET](#).

Tensions around the issue of digital privacy are understandably high following [Facebook's Cambridge Analytica scandal](#), but as far as we can tell there is no reason to worry here, and what Google is doing is above board.

In practice, Chrome on Windows looks through your computer in search of CIA targets and malware that targets the Chrome browser itself using ESET's antivirus engine. If it finds some suspected malware, it sends metadata of the file where the malware is stored, and some system information, to Google. Then, it asks you for permission to remove the suspected malicious file. (You can opt-out of sending information to Google by deselecting the "Report details to Google" checkbox.)

A screenshot of the Chrome pop-up that appears if Chrome Cleanup Tool detects malware on your Windows computer.

Last week, Kelly Shortridge, who works at cybersecurity startup SecurityScorecard, [noticed](#) that Chrome was scanning files in the Documents folder of her Windows computer.

"In the current climate, it really shocked me that Google would so quietly roll out this feature without publicizing more detailed supporting documentation even just to preemptively ease speculation," Shortridge told me in an online chat. "Their intentions are clearly security-minded, but the lack of explicit consent and transparency seems to violate their own criteria of a user-friendly software that informs the policy for Chrome Cleanup [Tool]."

Her tweet got a lot of attention and caused other people in the infosec community as well as average users such as me to scratch their heads.

"Nobody likes surprises," Haroon Meer, the founder at security consulting firm Thinkst, told me in an online chat. "When people fear a big brother, and tech behemoths going too far...a browser touching files it

has no business to touch is going to set off alarm bells.â

Read more: [*The Motherboard Guide to Not Getting Hacked*](#)

But as Johns Hopkins professor Matthew Green [put it](#), most people â are just a little creeped out that Chrome started poking through their underwear drawer without asking.â

Thatâ s the problem here: most users of an internet browser probably donâ t expect it to scan and remove files on their computers.

When reached out for comment, a Google spokesperson redirected me to the blog post from last year and Schuhâ s tweets.

â For almost all users, this seems really harmless, and for those who are extremely concerned about Google seeing some metadata, maybe they shouldn't be running Google's browser in the first place,â he said.

Google Chrome changes could destroy ad-blockers to help Google abuse more citizens

- [Share](#)

Image copyright AFP Image caption The underlying software for Chrome is widely used in other web browsers

Blocking ads could become much harder if Google makes proposed changes to its Chrome web browser, warn developers.

The changes could "destroy" ad-blockers, said one maker of widely-used blocking software.

Others said the update would make it far harder for users to stop firms tracking them online and make it easier for them to be bombarded with ads.

Google said the proposals were a "draft" and added that it would work with developers to limit their impact.

No changes

"This would basically mean that Google is destroying ad-blocking and privacy protection as we know it," said a [statement from ad-blocking developer Ghostery](#) given to the Gizmodo tech news site.

Ad-blockers are a type of add-on or extension for a web browser that, as their name implies, try to spot and stop the commercial messages found on many web pages. There are many different types of browser extension.

Ghostery's comments were echoed by Raymond Hill, head developer of the popular uBlock Origin add-on for Chrome, who said [the extension would "no longer be able to exist"](#) if the changes were enacted according to the current proposal.

In a message put on a key discussion list for Chrome, Google said [it wanted to make the changes](#) to improve the "security [and] privacy" of extensions and improve their performance.

Often, it said, when add-ons examine incoming data, web pages take longer to load.

- [Facebook's hidden battle against ad-blockers](#)
- [Google Chrome launches default ad-blocker](#)

The row has blown up over Google's plan to stop extensions changing data they receive from the sites that users visit. This ability to block, modify or redirect incoming data is key to the extensions' ability to stop ads and pop-ups, as well as to thwart attempts to track users or seize their data.

The proposed update would mean extensions can only look at the incoming data rather than alter it.

"I don't see what is to be gained from doing this," [Mr Hill from uBlock Origin](#) told The Register.

Other developers pointed to separate proposals that could also restrict the ability of browser extensions to protect users.

Following the comments and criticisms, Google said it planned to consult with the makers of browser add-ons to limit the changes they had to make.

"This design is still in a draft state, and will likely change," wrote Google software engineer Devlin Cronin in [a message put on the Chrome discussion list](#).

"Our goal is not to break extensions," he added.

Google Chrome tracking what YOU ARE doing? Browser is now logging people in WITHOUT their permission and 'syncing' user data, professor warns

- Chrome users logging into a Google service are also signed into the browser
- According to a cryptographer Google made these changes several weeks ago
- Professor Matthew Green revealed that people could mistakenly activate 'sync'
- This means the browser can log users' behaviour without them being aware of it

[Google](#) Chrome could be tracking what users are doing without them being aware of it, according to an expert in digital content protection.

Until recently Google Chrome users have been able to use the browser without logging in.

However, now when people log into a service such as Gmail they are automatically logged in without their consent.

According to cryptographer and Professor Matthew Green who wrote a blog post 'Why I'm done with Chrome', Google quietly made these changes several weeks ago.

Professor Green revealed that people could mistakenly activate 'sync', which means the firm can log users' behaviour and access their data without them knowing.

Professor Green warned that the development has 'enormous implications for user privacy and trust'.

Scroll down for video

•

For years Google Chrome users have been able to use the browser without logging in. However, now when people log into a Google service such as Gmail they are automatically logged into Chrome without their consent

'A few weeks ago Google shipped an update to Chrome that fundamentally changes the sign-in experience', Professor Green from the Johns Hopkins Information Security Institute wrote in his [blog](#).

'From now on, every time you log into a Google property (for example, Gmail), Chrome will automatically sign the browser into your Google account for you.

'Itâ I'll do this without asking, or even explicitly notifying you', he said.

This means users are unknowingly sending their data to Google if they have the 'sync' feature activated, he warned.

According to Professor Green, the barriers between 'signed in' and 'not signed in' are gradually being eroded away.

This means many of Chrome's one billion users are mistakenly consenting to their data being accessed as the Chrome sync user interface is confusing.

He believes these changes make a hash out of Google's own privacy policies.

'In short, Google has transformed the question of consenting to data upload from something affirmative that I actually had to put effort into â entering my Google credentials and signing into Chrome â into something I can now do with a single accidental click.

'This is a dark pattern. Whether intentional or not, it has the effect of making it easy for people to activate sync without knowing it, or to think theyâre already syncing and thus thereâs no additional cost to increasing Googleâs access to their data', he said.

•

Professor Green revealed that people could mistakenly activate 'sync' which means the browser can log users' behaviour and access their data without them being aware of it

A Google spokesperson directed MailOnline to a Twitter post by **Chrome engineer Adrienne Porter Felt** who explained that users still have to consent to have their data synced.

'I want to share more info about recent changes to Chrome sign-in', she wrote.

'Chrome desktop now tells you that you're "signed in" whenever you're signed in to a Google website.

'This does NOT mean that Chrome is automatically sending your browsing history to your Google account!', she wrote.

-

A Google spokesperson directed MailOnline to a Twitter post by Chrome engineer Adrienne Porter Felt who explained that users still have to consent to have their data synced

She also said that the Chrome privacy notice was being updated 'ASAP' to make the syncing option more clear.

Last month a study from **Vanderbilt University** gave a look at the just how much data Google is harvesting from its users.

Researchers examined how the search giant collects information from Android mobile devices, Chrome browsers, [YouTube](#) and Photos, among other Google products.

But the most surprising revelation gleaned from the study is likely to be that Google continues to collect data even when users are browsing in incognito mode.

Google collects data in 'active' ways, such as when users sign into an application, as well as 'passive' ways that users are less likely to be aware of.

In this scenario, an application is designed to gather information on users when it's running, sometimes without the user's knowledge.

+3

-

Last month a study from Vanderbilt University gave a look at the just how much data Google is harvesting from its users

'The extent and magnitude of Google's passive data collection has largely been overlooked by past studies on this topic,' according to the study, which was published last month.

Most people assume that their browsing history is hidden from Google when they use incognito mode.

However, the study explains that Google can still link the data from incognito browsers to a specific user.

That's because if a user logs into a Google account while a private browser is open, cookies left behind on the incognito window can identify them.

If they close out of the incognito window before logging into a Google account, then the data will be erased.

HOW DOES GOOGLE TRACK ITS USERS' LOCATIONS OUTSIDE OF 'LOCATION HISTORY'?

A new investigation led by the Associated Press found that some Google apps automatically store time-stamped location data without asking - even when you've paused Location History.

The investigation found, for example:

- Google stores a snapshot of where you are when you open its Maps app
- Automatic daily weather updates on Android phones pinpoint where you are each time the forecast is refreshed
- Simple searchers, such as 'chocolate chip cookies,' or 'kids science kits,' pinpoint your precise latitude and longitude â€” accurate to the square foot - and save it to your Google account

This information is all logged as part of the 'Web and App Activity' feature, which does not specifically reference location information in its description.

This is enabled by default, and stores a variety of information from Google apps and websites to your Google account.

When paused, it will prevent activity on any device from being saved to your account.

Leaving 'Web & App Activity' on and turning 'Location History' off only prevents Google from adding your movements to the 'timeline,' its visualization of your daily travels.

It does not stop Google's collection of other location markers.

'While such data is collected with user-anonymous identifiers, Google has the ability to connect this collected information with a user's personal credentials stored in their Google Account,' the study says.

What's more, even if you avoid using Google services on an iOS device, the firm can still collect data on users.

Visits to non-Google webpages still registered a 'surprisingly high' number of communications with Google servers.

'The number of times such Google services are called from an iOS device is similar to an Android device,' the study noted.

'In this experiment, the total magnitude of data communicated to Google servers from an iOS device is found to be approximately half of that from the Android device.'

Researchers were most concerned by the amount of 'passive' data collected via third-party networks and advertisers that aren't owned by Google.

Google 'learns a great deal about a user's personal interests' during a day of typical phone use - things like their location, routes taken, items purchased and music listened to,' the study explained.

Google Chrome is now logging people in WITHOUT their permission

Google Cloud is Busted by Russians and Chinese and Revealed To Be Security-Proof

By [Stephen Bryen](#)

Perhaps it is a good thing that Google employees convinced their management not to do business with the Pentagon, thereby pulling out of participating in a \$10 billion cloud computing contract called JEDI ([Joint Enterprise Defense Infrastructure](#)).

On November 12th, Google's services were [hit by a massive hack](#) allegedly carried out by Russians, Chinese, and Nigerians. The hack redirected all of Google's search, business, and cloud computing operations through servers run in these countries using a hack called the [Border Gateway Protocol](#) (BGP). This gave the hackers unprecedented access to extremely sensitive information on users and direct access to any data that was not independently encrypted (one presumes that the typical computer network security protocols were automatically compromised by being run through servers that did not belong to Google). Even more critically, it gave the three countries complete control over all of Google's operations and data. While the hack only lasted about an hour and a half, it demonstrated in clear terms just how vulnerable computer networks are and showed that the critical infrastructure could have been taken down, had the hackers wanted to do so.

For the record, the Google Cloud and Google's G-Suite business services have good security practices, and the Google Cloud in particular has some security features that are quite advanced. But that did not stop the BGP hack, because BGP hacks exploit the IP addresses and information routing addresses that are built into the modern internet. Worse yet, computer experts say that current technology can't stop a BGP hack.

The Pentagon with its JEDI contract wants to migrate its computer networks to the cloud, and just not any old cloud but a cloud system run by private enterprise that is shared with the public. While the Pentagon doubtlessly will use some form of encryption for its cloud operations, it cannot protect the exploitation of its networks if exposed on a public network. Moreover, the Pentagon has yet to explain how it will back up the system if it fails for

any reason.

The Pentagon points out that the [CIA already is on the cloud](#) using Amazon's cloud services. In fact, the Pentagon wanted to use the same vendor, but ran into a buzzsaw of complaints about the lack of competition. While the Pentagon closed the bids for the JEDI contract on October 12th, the complaints are still rolling in and two major vendors, Oracle and IBM, are protesting the JEDI contract through the Government Accountability Office. Where this will end up is still anyone's guess.

But the hack of Google should be sobering enough that deciding to go with the cloud approach really needs a serious security scrub. Beyond that, the entire computer network environment used by DOD should be assessed because it is dangerous and highly failure prone and is costing billions in lost technology and compromised information. The Pentagon has set up a special [Task Force](#) to try and address technology losses.

The core issue is what the networks are made of today. Most of the computer equipment including network routers and ancillary devices such as printers and web cameras, are made in China. All of them are inherently non-secure because of where they come from and because the U.S. government, including the Pentagon and the military services, buy equipment without any security vetting. No equipment is tested for security and, for the most part the buying process is based on published specifications provided by the manufacturing company or distributor. Even equipment that looks American is usually stuffed with parts that come from abroad. No one can tell you what's inside the box.

China has been known to plant [hardware, firmware, and software](#) in devices such as computer motherboards or smart phones. Given that more than 70 percent of all computer hardware either is Chinese in origin or contains Chinese origin components, no one can trust present-day networks. Harvesting information is, therefore quite easy for Chinese spies and China has used what it has stolen to build everything from stealth fighter planes to modern missiles.

If the existing network is not trustworthy, the new cloud computing environment just expands the problem from a specific target to the broader

network itself, meaning that command and control systems and communications become instantly vulnerable. Even if there are backup systems, the sheer volume of a cloud computing crash means that recovery could be very difficult, perhaps not even possible.

One can add to the risk profile the question of backup systems. Pentagon networks have grown up over many years, have been modified as new technology and new demands require more data handling and better information management, and because they are complex often are a mix of old and new equipment, compounding vulnerabilities and the challenge of keeping them in good operating shape. When the cloud becomes a replacement, keeping the old system as a backup is a major challenge, if it can be done at all. More likely is that the old system will progressively get scrapped in favor of the "cheaper" cloud, replacing a largely distributed system with a centralized target for foreign adversaries.

The Pentagon buys a lot of military hardware based on a process of writing specifications and measuring performance, with milestones and requirements needing to be met to move onto the next acquisition stage. While the current system is expensive and burdensome, generally it produces good results (although there are still failures). But when it comes to electronics and computers, mostly the acquisition process is replaced by buying equipment "off the shelf." This is called COTS (commercial off the shelf) hardware and software. COTS has got the Pentagon, the military, and its many contractors into a lot of trouble because of the ease of foreign hacking of data. When you transfer most of these vulnerabilities to the cloud you centralize the security vulnerability and expose the entire system to potential compromise or collapse.

Google will recover from the Chinese, Russian, and Nigerian redirect of their services. Probably they won't even be able to do much of an assessment of what was compromised or lost, so they will plow ahead and put the redirect of their system on the back burner. When the Pentagon is up on the cloud, the outcome will be a lot worse.

Google Co-Founder Sergey Brin Deeply Offended by Trump's Election

[982](#)

“As an immigrant and a refugee, I certainly find this election deeply offensive, and I know many of you do too.”

That's how Sergey Brin, co-founder of one of the most influential companies in the world, summed up his and much of Google's reaction to the election of Donald J. Trump in 2016.

The comments were brought to light in a video leaked exclusively to Breitbart News by an anonymous source. The video is a full recording of Google's first all-hands meeting following the 2016 election, featuring CEO Sundar Pichai, co-founders Sergey Brin and Larry Page, and several other Google executives. It can be watched in full below.

“This is probably not the most joyous TGIF we've had,” said Brin, who opened the meeting.

Captured just a few days after the 2016 election, it shows Google executives united in dismay at the outcome of the vote.

Brin suggests that Trump voters were acting out of “boredom”, which he says has in the past have been one of the factors giving rise to fascism and communism.

Watch entire leaked video:

Responding to an online question that expressed concern at the growing income disparities between America's heartland and its coastal regions, Brin responds:

“I think everyone's presuming that some of these folks left behind are specifically the people who voted for Trump. I don't think the data quite supports that. I know there's the geographic, roughly speaking, spread [but] Hillary won the lower-income demographic.”

“The biggest relationship was whether people had really routine jobs, um, in an area, that correlated highly, uh, with Trump support versus non-routine jobs. There's actually a lot of historical precedent for boredom being a huge factor in vote choice and actually in building extremism.”

Later in the video, Brin says “data shows that boredom led to fascism and also the communist revolutions, I mean there are many other factors too, but, uh, it sort of sneaks up, sometimes, you know, really bad things.”

Brin goes on to say that Google should think about how it can improve “governance” and “decision-making.”

“So I think it's worth being very vigilant and thinking about all these issues, what we can do to lead to maybe a better quality of governance and decision-making and so forth.”

How will Google combat the “extremism” that Brin links to Trump support? The co-founder references it himself elsewhere in the clip: the company’s internal think-tank, “Jigsaw,” which has developed tools to redirect users away from “extremist” content in search results on both Google Search and YouTube.

While Google pitched Jigsaw to the media and to Senators as a tool to fight Islamic terrorist groups like ISIS, the context of his discussing it in relation to the 2016 election suggests that his conception of “extremism” — which was not challenged by any Google executive on stage — is far broader.

Update — After Breitbart News published this article, a Google spokesperson replied to a request for comment with the following statement:

“At a regularly scheduled all hands meeting, some Google employees and executives expressed their own personal views in the aftermath of a long and divisive election season. For over 20 years, everyone at Google has been able to freely express their opinions at these meetings. Nothing was said at that meeting, or any other meeting, to suggest that any political bias ever influences the way we build or operate our products. To the contrary, our products are built for everyone, and we design them with extraordinary care to be a trustworthy source of information for everyone, without regard to political viewpoint.”

Google Critic Ousted From Deep State Think Tank That Google Funds, Called 'New America Foundation'

Barry Lynn ran a New America initiative called Open Markets.

[Technology](#) By [Rebecca Gibian](#)

Barry Lynn, who ran a New America initiative called Open Markets, which has led a growing chorus of liberal criticism of the market dominance of telecom and tech giants, including Google, has been let go from New America, a think tank that Google funds.

Recently, Lynn wrote a [statement](#) on the think tank's website praising the European Union's penalty against Google. Eric Schmidt, Google's parent company chairman, spoke of his displeasure to the group's president, Anne-Maria Slaughter.

The statement was taken off the website, but was reposted without explanation a few hours later. However, most people at New America, which employs more than 200 people, heard about the event. The episode left the dozens of researchers, writers and scholars with two concerns: would Google defund the think tank, and could the think tank be truly independent if it had to worry about offending its donors?

The New American Foundation has received more than \$21 million from Google, Schmidt, and his family's foundation since the think tank's found in 1999. [The New York Times](#) reports that the money has helped New America establish itself as an elite voice in policy debates on the American left.

In an email from Slaughter to Lynn, Slaughter says that “the time has come for Open Markets and New America to part ways,” and suggested that the entire Open Markets team, which is about 10 full-time employees and unpaid fellows, would be removed from New America.

The Times writes that Slaughter accused Lynn of “imperiling the institution as a whole.” Meanwhile, Lynn told the *Times* that Slaughter caved to pressure from Schmidt and Google, and in doing so, “set the desires of a donor over the think tank’s intellectual integrity.”

Google denies any suggestion that it played a role in the split. Riva Sciuto, a Google spokeswoman, said the company supports a wide range of think tanks and nonprofits focused on information access and internet regulation.

Lynn has a strong influence in raising concerns about the market dominance of Google, Amazon and Facebook. In 2016 he organized a conference that warned of the damaging effects from market consolidation in tech. Before that conference, Slaughter and New America’s lead fundraiser emailed Lynn, indicating Google was concerned that its positions were not going to be represented, and that it was not given advanced notice of the event.

Now, Lynn is trying to start a stand-alone nonprofit with the same Open Market’s team. It has launched a website called Citizens Against Monopoly, which accuses Google of “trying to censor journalists and researchers who fight dangerous monopolies.” The site vows to not let them get away with this.

Google does have a large influence, writes the *Times*. It spent \$95 million on lobbying through the first half of this year, which is more than almost any other company.

The Times writes that one of Google’s most effective, if

little examined, tools is its funding of nonprofit groups across the political spectrum. It has donated to 170 such groups this year alone.

But those alliances could be tested this year. Recently, a male engineer posted a critique of the company's efforts to diversify, and there are questions about the company's commitment to privacy. And of course, there are the questions about Google's mounting market dominance, as it handles an overwhelming majority of all internet searches globally and dominates internet advertising, writes the *Times*. And in June, it received a \$2.7 billion antitrust penalty from the European Union for allegedly tilting search results to favor its services over those offered by competitors.

Lynn's Open Market statement that Schmidt didn't like praised this fine, and asked U.S. regulators to more aggressively enforce antitrust rules against places like Google and Amazon.

Democratic congressional leaders did roll out a policy platform last month that pledges to dismantle monopolies, including cable and internet service.

Google Culture War Escalates as Era of Transparency Gets Shut Down By Corrupt Google Bosses

Ryan Gallagher and Mark Bergen

[Bloomberg](#)

[View photos](#)

(Bloomberg) -- Each morning, workers at Google get an internal newsletter called the "Daily Insider." Kent Walker, Google's top lawyer, set off a firestorm when he argued in the Nov. 14 edition that the 21-year old company had outgrown its policy of allowing workers to access nearly any internal document. "When we were smaller, we all worked as one team, on one product, and everyone understood how business decisions were made," Walker wrote. "It's harder to give a company of over 100,000 people the full context on everything."

Many large companies have policies restricting access to sensitive information to a "need-to-know" basis. But in some segments of Google's workforce, the reaction to Walker's argument was immediate and harsh. On an internal messaging forum, one employee described the data policy as "a total collapse of Google culture." An engineering manager posted a lengthy attack on Walker's note, which he called "arrogant and infantilizing." The need-to-know policy "denies us a form of trust and respect that is again an important part of the intrinsic motivation to work here," the manager wrote.

The complaining also spilled into direct action. A group of Google programmers created a tool that allowed employees to choose to alert Walker with an automated email every time they opened any document at all, according to two people with knowledge of the matter. The deluge of notifications was meant as a protest to what they saw as Walker's insistence on controlling the minutiae of their professional lives.

"When it comes to data security policies, we've never intended to prevent employees from sharing technical learnings and information and we are not limiting anyone's ability to raise concerns or debate the company's activities," said a Google spokeswoman in an email. "We have a responsibility to safeguard our user, business and customer information and these activities need to be done in line with our policies on data security."

The actions are just the latest chapter in an internal conflict that has been going on for almost two years. About 20,000 employees walked out last fall over the company's generous treatment of executives accused of sexual harassment, and a handful quit over Google's work on products for the U.S. military and a censored search engine for the Chinese market. Earlier this year, Google hired IRI Consultants, a firm that advises employers on how to combat labor organizing, and it recently fired four employees for violating its policies on accessing sensitive data.

The extent of Google's employee rebellion is hard to measure—the company has tried to portray it as the work of a handful of malcontents from the company's junior ranks. Nor are the company's message boards unilaterally supportive of revolt. "We want to focus on our jobs when we come into the workplace rather than deal with a new cycle of outrage every few days or vote on petitions for or against Google's latest project," wrote one employee on an internal message board viewed by Bloomberg News.

Still, the company seems stuck in a cycle of escalation. Walker's internal critics say his Nov. 14 email is part of a broader erosion of one of Google's most distinctive traits—its extreme internal transparency.

The fight also illustrates the lack of trust between Google's leadership and some of its employees, according to interviews with over a dozen current and former employees, as well as internal messages shared with Bloomberg News on the condition it not publish the names of employees who participated.

The conflict comes as Google is changing in other ways, too. On Dec. 3, Sundar Pichai, who took over as Google's chief executive office in 2015, became the head of Alphabet, its parent company. His elevation marks the end of the active involvement of Sergey Brin and Larry Page, who established Google's distinctive culture when they founded the company as Stanford graduate students.

Pichai has at times supported internal activism. He spoke at an employee protest against the Trump administration's immigration policies and apologized to employees for Google's track record on sexual harassment. His executives met repeatedly with critics of the company's military work. Some Google managers began signaling that they're losing patience with internal activism even before the firings, according to one person who worked with them. Executives have not met with dissenting staff leadership in many weeks, according to one of the employees.

Google Design Lead David Hogue Will Descend into Flames of Hell

Fred

Schilling/Supreme Court of the United States via Getty Images, WhatTheyThink.com [6065](#)

In a Twitter rant over the weekend, Google design lead Dave Hogue claimed Republicans will “descend into the flames” of hell, and described members of the GOP as “treasonous” and “evil” following the confirmation of Brett Kavanaugh to the Supreme Court.

“You are finished, @GOP. You polished the final nail for your own coffins. FUCK. YOU. ALL. TO. HELL,” posted Hogue. “I hope the last images burned into your slimy, evil, treasonous retinas are millions of women laughing and clapping and celebrating as your souls descend into the flames.”

Hogue soon deleted the [post](#) and made a follow-up tweet condemning the Republican Party while also adding that he “should have been more eloquent and less condemning” in the previous post.

“Yes, I deleted that tweet. Yes, those opinions are mine personally, and I am responsible for them. Yes, I should have been more eloquent and less condemning,” declared Hogue. “Yes, I still believe the @GOP is wrong and not serving your best interests. Yes, I still believe we can do much better.”

Google Doubles Down on Purging Conservative Speech

The Associated Press

by [Chriss W. Street](#) 22 Aug 2017 Newport Beach, CA

Google [announced](#) that their monopolistic search engine that controls [87 percent](#) of page views will use its machine learning tool set to assist liberal groups in doubling down on purging conservative speech they consider hate.

TechCrunch blog [reported](#) that Google has partnered with *ProPublica* coalition and Pitch Interactive to create a data visualization tools that leverage the [Google Cloud Natural Language API](#) analytic algorithm to extract geographic and contextual information to provide journalists with a 50-state [Hate News Index](#).

The [Media Bias/Fact Check](#) blog that analyzes the point-of-view of over 1,700+ news sources, [rates ProPublica](#) as [Left-Center Bias](#). The top link on its landing page, [THE TRUMP ADMINISTRATION: Ongoing coverage of the 45th president and his new administration](#), reflects that point-of-view by prominently listing [Documenting Hate](#) directly underneath.

The Google/*ProPublica* coalition partners are all Center-Left Bias or Left Bias including the New York Times, BuzzFeed, Univision News, WNYC, First Draft, The Root, Meedan, New America Media, Latino USA, Ushahidi, The Advocate and 100 Days in Appalachia.

Although the coalition states they will work on civil rights issues with the highly respected University of Miami School of Communications, they also will rely on input from George Sorosâ Open Society Foundation-funded and the radically Left [Southern Poverty Law Center](#).

Google states that they launched the Documenting Hate project due to the lack of national data on âhate crimes,â which their Dictionary [defines](#) as: âa crime motivated by racial, sexual, or other prejudice, typically one involving violence.â But a Google search under âhate crimeâ produces âAbout 10,300,000 results.â

Conservative sites have complained for years that Facebook and Twitter trending news curators were biased against their publications. After former âtrending newsâ editors [told](#) Gizmodo in October, just weeks before the presidential election, that ninety of the Facebook news curation staff are liberal and â[We Routinely Suppressed Conservative News](#),â CEO Mark Zuckerberg was forced to fire the entire group and use an app to curate news.

Googleâs reputation for being relatively impartial seems to have changed after the January 2017 swearing in of Donald Trump as the 45th President of the United States. Quartz [reported](#) less than a month later, Google and its Alphabet sister company [Jigsaw](#) would start using a set of machine learning to police the Internet against hate speech.

Jigsawâs landing page [advertises](#) its âtechnology make people in the world safer.â Its suite of machine learning anti-hacker tools includes [Perspective](#), [Project Shield](#), [uProxy](#), [Password Alert](#), [Conversation AI](#), [Digital Attack Map](#), and [Unfiltered News](#). But a deeper investigation of the Jigsaw site illuminates what the company calls âGraduatedâ tools used to censor and demonetize Google search results that include [Share the Facts](#), [Redirect Method](#), [Montage](#), [Copcast](#), [Sideways Dictionary](#) and [Investigative Dashboard](#).

Each of the âGraduatedâ tools were supposedly designed to interrupt dangerous Internet activity, such as ISIS recruiting of terrorists. But the scandal surrounding James Damoreâs outing of âGoogleâs Ideological Echo Chamberâ has elevated concerns that the company is [using](#) the Redirect Method to âcombatâ the online vitriol of conservative speech.

[According](#) to Jigsaw: âThe Redirect Method is focused on reaching those who are actively looking for extremist content and connections. Rather than create new content and counter-narratives, our approach tries to divert young people off the path to extremism using pre-existing YouTube content and targeted advertising.â

Conservative should be concerned that Googleâs use of âtoolsâ to selectively shame hate speech sound allot like the âcounter propagandaâ tools described in the [U.S. Army PSYOP Field Manual](#) to âexploit the psychological soft spots created by an individualâs needs, goals, fears, and worries.â

Google Drops "Don't Be Evil" Motto From Its Code Of Conduct

SHARE

[Facebook](#)

[Twitter](#)

Image:

Flickr/tangi bertin

In 2015, when Google reorganized itself under Alphabet, the new parent company drafted a new motto for itself: "Do the right thing." However, Google's own unofficial motto remained "Don't be evil." The company kept it as a part of the corporate code of conduct since 2000.

In the latest development, [Gizmodo](#) has uncovered that Google has dropped the "Don't be evil" phrase from its Code of Conduct. As per the findings, the updated version of the web page, which was first archived by the Wayback Machine, has a significant change.

The [earlier version](#) of the had numerous mentions of the phrase all across the page.

- "Don't be evil." Googlers generally apply those words to how we serve our users.
- "Don't be evil" is much more than that

- The Google Code of Conduct is one of the ways we put âDonât be evilâ into practice

In the [new page](#), thereâs just one mention of the phrase in the last paragraph. It says:

- And rememberâ I donât be evil, and if you see something that you think isnât right â speak up!

Despite this big change in the Code of Conduct, the page states that it was last updated on April 5, 2018.

Google Earth: how the tech giant is helping the state spy on us

Composite: Alamy/Guardian Design

We knew that being connected had a price — our data. But we didn't care. Then it turned out that Google's main clients included the military and intelligence agencies. By [Yasha Levine](#)

The internet surrounds us. It mediates modern life, like a giant, unseen blob that engulfs the modern world. There is no escape, and, as Larry Page and Sergey Brin so astutely understood when they [launched Google in 1998](#), everything that people do online leaves a trail of data. If saved and used correctly, these traces make up a goldmine of information full of insights into people on a personal level as well as a valuable read on larger cultural, economic and political trends.

Lose yourself in a great story: Sign up for the long read email

Read more

[Google](#) was the first internet company to fully leverage this insight and build a business on the data that people leave behind. But it wasn't alone for long. It happened just about everywhere, from the smallest app to the most sprawling platform.

Uber, Amazon, Facebook, eBay, Tinder, Apple, Lyft, Foursquare, Airbnb, Spotify, Instagram, Twitter, Angry Birds — if you zoom out and look at the bigger picture, you can see that, taken together, these companies have turned our computers and phones into bugs that are plugged in to a vast corporate-owned surveillance net-work. Where we go, what we do, what we talk about, who we talk to, and who we see — everything is recorded and, at some point, leveraged for value. Google, Apple and Facebook know when a woman visits an abortion clinic, even if she tells no one else: the GPS coordinates on the phone don't lie. One-night stands and extramarital affairs are a cinch to figure out: two smartphones that never met before suddenly cross paths in a bar and then make their way to an apartment across town, stay together overnight, and part in the morning.

They know us intimately, even the things that we hide from those closest to us. In our modern internet ecosystem, this kind of private surveillance is the norm. It is as unnoticed and unremarkable as the air we breathe. But even in this advanced, data-hungry environment, in terms of sheer scope and ubiquity, Google reigns supreme.

As the internet expanded, Google grew along with it. No matter what service it deployed or what market it entered, surveillance and prediction were cooked into the business. The amount of data flowing through Google's systems is staggering. By the end of 2016, Google's Android was installed on 82% of all new smartphones sold around the world, and by mid-2017 there were more than 2 billion Android users globally.

Google also handles billions of searches and YouTube plays daily, and has [a billion active Gmail users](#), meaning it had access to most of the world's emails. Some analysts estimate that 25% of all internet traffic in North America goes through Google's servers. The company isn't just connected to the internet, it *is* the internet.

Google has pioneered a whole new type of business transaction. Instead of paying for its services with money, people pay with their data. And the services it offers to consumers are just the lures, used to grab people's data and dominate their attention — attention that is contracted out to advertisers. Google has used data to grow its empire. By early 2018, Google's parent company, Alphabet, had 85,050 employees, working out of more than 70 offices in 50 countries. The company had a market capitalisation of \$727bn at the end of 2017, making it the second most valuable public company in the world, beaten only by Apple, another [Silicon Valley](#) giant. Its profits for the first quarter of 2018 were \$9.4bn.

. Google co-founders Larry Page, left, and Sergey Brin in 2004. Photograph: Ben Margot/AP

Meanwhile, other internet companies depend on Google for survival. Snapchat, Twitter, Facebook, Lyft and Uber have all built multi-billion-dollar businesses on top of Google's ubiquitous mobile operating system. As the gatekeeper, Google benefits from their success as well. The more people who use their mobile devices, the more data it gets on them.

What does Google know? What can it guess? Well, it seems just about everything. — One of the things that eventually happens — is that we don't need you to type at all, — [Eric Schmidt](#), Google's former CEO, said in a moment of candour in 2010. — Because we know where you are. We know where you've been. We can more or less guess what you're thinking about. — He later added: — One day we had a conversation where we figured we could just try to predict the stock market. And then we decided it was illegal. So we stopped doing that. —

It is a scary thought, considering that Google is no longer a cute startup but a powerful global corporation with its own political agenda and a mission to maximise profits for shareholders. Imagine if Philip Morris, Goldman Sachs or a military contractor like Lockheed Martin had this kind of access.

Not long after Brin and Page incorporated Google, they began to see their mission in bigger terms. They weren't just building a search engine or a targeted advertising business. They were organising the world's information to make it accessible and useful for everyone. It was a vision that also encompassed the Pentagon.

Even as Google grew to dominate the consumer internet, a second side of the company emerged, one that rarely got much notice: Google the government contractor. As it turns out, the same platforms and services that Google deploys to monitor people's lives and grab their data could be put to use running huge swathes of the US government, including the military, spy agencies, police departments and schools. The key to this transformation was a small startup now known as Google Earth.

In 2003, a San Francisco company called Keyhole Incorporated was on the ropes. With a name recalling the CIA's secret 1960s — Keyhole — spy satellite programme, the company had been launched two years earlier as a spinoff from a videogame outfit. Its CEO, John Hanke, told journalists that the inspiration for his company came from [Neal Stephenson's Snow Crash](#), a cult science-fiction novel in which the hero taps into a programme created by the — Central Intelligence Corporation — called Planet Earth, a virtual reality construct designed, as the book describes, to — keep track of every bit of spatial information that it owns — all the maps, weather data, architectural plans, and satellite surveillance stuff —.

Keyhole had its roots in videogame technology, but deployed it in the real world, creating a programme that stitched satellite images and aerial photographs into seamless 3D computer models of the Earth that could be explored as if they were in a virtual reality game world. It was a groundbreaking product that allowed anyone with an internet connection to virtually fly over anywhere in the world. The only problem was Keyhole's timing: it was a bit off. It launched just as the dotcom bubble blew up in Silicon Valley's face. Funding dried up, and Keyhole found itself struggling to survive. Luckily, the company was saved just in time by the very entity that inspired it: the [CIA](#).

Google at 20: how two 'obnoxious' students changed the internet

Read more

In 1999, at the peak of the dot-com boom, the CIA had launched In-Q-Tel, a Silicon Valley venture capital fund whose mission was to invest in start-ups that aligned with the agency's intelligence needs. Keyhole seemed a perfect fit.

The CIA poured an unknown amount of money into Keyhole. The investment was finalised in early 2003, and it was made in partnership with the National Geospatial-Intelligence Agency, a major intelligence organisation with 14,500 employees and a \$5bn budget, whose job was to deliver satellite-based intelligence to the CIA and the Pentagon. Known as the NGA, the spy agency's motto was: 'Know the Earth. Show the Way. Understand the World.'

The CIA and NGA were not just investors; they were also clients, and they involved themselves in customising Keyhole's virtual map product to meet their own needs. Months after In-Q-Tel's investment, Keyhole software was already integrated into operational service and deployed to support US troops during Operation Iraqi Freedom, the shock-and-awe campaign to overthrow Saddam Hussein. Intelligence officials were impressed with the 'videogame-like' simplicity of its virtual maps. They also appreciated the ability to layer visual information over other intelligence. The possibilities were limited only by what contextual data could be fed and grafted on to a map: troop movements, weapons caches, real-time weather and ocean conditions, intercepted emails and phone call intel, and mobile phone locations.

Keyhole gave intelligence analysts, field commanders, air force pilots and others the kind of capabilities we take for granted today when we use digital mapping services on our computers and smartphones to look up restaurants, cafes, museums, traffic or subway routes.

Military commanders weren't the only ones who liked Keyhole. So did Sergey Brin. He liked it so much that he insisted on personally demoing the app for Google executives. According to an account published [in Wired](#), he barged in on a company meeting, punched in the address of every person present, and used the programme to virtually fly over their homes.

In 2004, the same year Google went public, Brin and Page bought the company outright, CIA investors and all. They then absorbed the company into Google's growing internet applications platform. Keyhole was reborn as Google Earth.

The purchase of Keyhole was a milestone for Google, marking the moment the company stopped being a purely consumer-facing internet company and began integrating with the US government. When Google bought Keyhole, it also acquired an In-Q-Tel executive named Rob Painter, who came with deep connections to the world of intelligence and military contracting, including US Special Operations, the CIA and major defence firms, among them Raytheon, Northrop Grumman and Lockheed Martin. At Google, Painter was planted in a new dedicated sales and lobbying division called Google Federal, located in Reston, Virginia, a short drive from the CIA's headquarters in Langley. His job was to help Google grab a slice of the lucrative military-intelligence contracting market. Or, as Painter described in contractor-bureaucratese, 'evangelising and implementing Google Enterprise solutions for a host of users across the intelligence and defence communities'.

Google had closed a few previous deals with intelligence agencies. In 2003, it scored a \$2.1m (£1.7m) contract to outfit the National Security Agency (NSA) with a customised search solution that could scan and recognise millions of documents in 24 languages, including on-call tech support in case anything went wrong.

In 2004, Google landed a search contract with the CIA. The value of the deal isn't known, but the agency did ask Google's permission to customise the CIA's internal Google search page by placing the CIA's seal in one of the Google logo's Os. "I told our sales rep to give them the OK if they promised not to tell anyone. I didn't want it spooking privacy advocates," wrote Douglas Edwards, Google's first director of marketing and brand management, in his 2011 book *I'm Feeling Lucky: The Confessions of Google Employee Number 59*. Deals such as these picked up pace and increased in scope after Google's acquisition of Keyhole.

In 2006, Google Federal went on a hiring spree, snapping up managers and salespeople from the army, air force, CIA, Raytheon and Lockheed Martin. It beefed up its lobbying muscle and assembled a team of Democratic and Republican operatives.

Even as it expanded into a transnational multi-billion-dollar corporation, Google had managed to retain its geekily innocent and not be evil image. So while Google's PR team did its best to keep the company wrapped in a false aura of altruism, company executives pursued an aggressive strategy to become the Lockheed Martin of the internet age. "We're functionally more than tripling the team each year," Painter said in 2008. It was true. With insiders plying their trade, Google's expansion into the world of military and intelligence contracting took off.

In 2007, it partnered with Lockheed Martin to design a visual intelligence system for the NGA that displayed [US military](#) bases in Iraq and marked out Sunni and Shia neighbourhoods in Baghdad – important information for a region that had experienced a bloody sectarian insurgency and ethnic cleansing campaign between the two groups. In 2008, Google won a contract to run the servers and search technology that powered the CIA's Intellipedia, an intelligence database modelled after Wikipedia that was collaboratively edited by the NSA, CIA, FBI and other federal agencies. Not long after that, Google contracted with the US army to equip 50,000 soldiers with a customised suite of mobile Google services.

In 2010, as a sign of just how deeply Google had integrated with US intelligence agencies, it won an exclusive, no-bid \$27m contract to provide the NGA with a geospatial visualisation services, effectively making the company the eyes of America's defence and intelligence apparatus. Competitors criticised the NGA for not opening the contract to the customary bidding process, but the agency defended its decision, saying it had no choice: it had spent years working with Google on secret and top-secret programmes to build Google Earth technology according to its needs, and could not go with any other company.

Google has been tight-lipped about the details and scope of its contracting business. It does not list this revenue in a separate column in quarterly earnings reports to investors, nor does it provide the sum to reporters. But an analysis of the federal contracting data-base maintained by the US government, combined with information gleaned from Freedom of Information Act requests and published reports on the company's military work, reveals that Google has been doing brisk business selling Google Search, Google Earth and Google Enterprise (now known as G Suite) products to just about every major military and intelligence agency, including the state department. Sometimes Google sells directly to the government, but it also works with established contractors like Lockheed Martin and Saic (Science Applications International Corporation), a California-based intelligence mega-contractor which has so many former NSA employees working for it that it is known in the business as "NSA West".

Google's entry into this market makes sense. By the time Google Federal went online in 2006, the Pentagon was spending the bulk of its budget on private contractors. That year, of the \$60bn US intelligence budget, 70%, or \$42bn, went to corporations. That means that, although the government pays the bill, the actual work is done by Lockheed Martin, Raytheon, Boeing, Bechtel, Booz Allen Hamilton and other powerful contractors. And this isn't just in the defence sector. By 2017, the federal government was spending \$90bn a year on information technology. It's a huge market – one in which Google seeks to

maintain a strong presence. And its success has been all but guaranteed. Its products are the best in the business.

Hereâs a sign of how vital Google has become to the US government: in 2010, following a disastrous intrusion into its system by what the company believes was a group of Chinese government hackers, Google entered into a secretive agreement with the NSA. â According to officials who were privy to the details of Googleâs arrangements with the NSA, the company agreed to provide information about traffic on its networks in exchange for intelligence from the NSA about what it knew of foreign hackers,â wrote defence reporter Shane Harris in @War, a history of warfare. â It was a quid pro quo, information for information. And from the NSAâs perspective, information in exchange for protection.â

This made perfect sense. Google servers supplied critical services to the Pentagon, the CIA and the state department, just to name a few. It was part of the military family and essential to American society. It needed to be protected, too.

Google didnât just work with intelligence and military agencies, but also sought to penetrate every level of society, including civilian federal agencies, cities, states, local police departments, emergency responders, hospitals, public schools and all sorts of companies and nonprofits. In 2011, the National Oceanic and Atmospheric Administration, the federal agency that researches weather and the environment, switched over to Google. In 2014, the city of Boston deployed Google to run the information infrastructure for its 76,000 employees â from police officers to teachers â and even migrated its old emails to the Google cloud. The Forest Service and the Federal Highway Administration use Google Earth and Gmail.

In 2016, New York City tapped Google to install and run free wifi stations across the city. California, Nevada and Iowa, meanwhile, depend on Google for cloud computing platforms that predict and catch welfare fraud. Meanwhile, Google mediates the education of [more than half](#) of Americaâs public school students.

. New York City mapped in an early version of Google Earth from 2006. Photograph: AP

â What we really do is allow you to aggregate, collaborate and enable,â explained Scott Ciabattari, a Google Federal sales rep, during a 2013 government contracting conference in Wyoming. He was pitching to a room full of civil servants, telling them that Google was all about getting them â intelligence analysts, commanders, government managers and police officers â access to the right information at the right time. He ran through a few examples: tracking flu outbreaks, monitoring floods and wildfires, safely serving criminal warrants, integrating surveillance cameras and face recognition systems, and even helping police officers respond to school shootings.

â We are getting this request more and more: â Can you help us publish all the floorplans for our school district? If there is a shooting disaster, God forbid, we want to know where things are.â Having that ability on a smartphone, being able to see that information quickly at the right time saves lives,â he said. A few months after this presentation, Ciabattari met with officials from Oakland, California to discuss how Google could help the city build its police surveillance centre.

This mixing of military, police, government, public education, business and consumer-facing systems â all funnelled through Google â continues to raise alarms. Lawyers fret over whether Gmail violates attorney-client privilege. Parents wonder what Google does with the information it collects on their kids at school. What does Google do with the data that flows through its systems? Is all of it fed into Googleâs big corporate surveillance pot? What are Googleâs limits and restrictions? Are there any? In response to these questions, Google offers only vague and conflicting answers.

Of course, this concern isnât restricted to Google. Under the hood of most other internet companies we use every day are vast systems of private surveillance that, in one way or another, work with and empower the

state. On a higher level, there is no real difference between Google's relationship with the US government and that of these other companies. It is just a matter of degree. The sheer breadth and scope of Google's technology make it a perfect stand-in for the rest of the commercial internet ecosystem.

Indeed, Google's size and ambition make it more than a simple contractor. It is frequently an equal partner that works side by side with government agencies, using its resources and commercial dominance to bring companies with heavy military funding to market. In 2008, a private spy satellite called GeoEye-1 was launched in partnership with the National Geospatial-Intelligence Agency; Google's logo was on the launch rocket and the company secured exclusive use of the satellite's data for use in its online mapping. Google also bought Boston Dynamics, a robotics company that made experimental robotic pack mules for the military, only to sell it off after [the Pentagon determined](#) it would not be putting these robots into active use. It has invested \$100m in CrowdStrike, a major military and intelligence cyber defence contractor that, among other things, led the investigation into the alleged 2016 Russian government hacks of the Democratic National Committee. And it also runs Jigsaw, [a hybrid thinktank/technology incubator](#) aimed at leveraging internet technology to solve thorny foreign policy problems — everything from terrorism to censorship and cyberwarfare.

Founded in 2010 by Eric Schmidt and Jared Cohen, a 29-year-old state department whizz-kid who served under both George W Bush and Barack Obama, Jigsaw has launched multiple projects with foreign policy and national security implications. It ran polling for the US government to help war-torn Somalia draft a new constitution, developed tools to track global arms sales, and worked with a startup funded by the state department to help people in Iran and China route around internet censorship.

It also built a platform to combat online terrorist recruitment and radicalisation, which worked by identifying Google users interested in Islamic extremist topics and diverting them to state department webpages and videos developed to dissuade people from taking that path. Google calls this the [redirect method](#), a part of Cohen's larger idea of using internet platforms to wage a digital counterinsurgency. And, in 2012, as the civil war in Syria intensified and American support for rebel forces there increased, Jigsaw brainstormed ways it could help push Bashar al-Assad from power. Among them: a tool that visually maps high-level defections from Assad's government, which Cohen wanted to beam into Syria as propaganda to give confidence to the opposition.

Jigsaw seemed to blur the line between public and corporate diplomacy, and at least one former state department official accused it of fomenting regime change in the Middle East. "Google is getting [White House] and state department support and air cover. In reality, they are doing things the CIA cannot do," wrote Fred Burton, an executive at global intelligence platform Stratfor and a former intelligence agent at the security branch of the state department.

But Google rejected the claims of its critics. "We're not engaged in regime change," Eric Schmidt [told Wired](#). "We don't do that stuff. But if it turns out that empowering citizens with smartphones and information causes changes in their country — you know, that's probably a good thing, don't you think?"

Jigsaw's work with the state department has raised eyebrows, but its function is a mere taste of the future if Google gets its way. As the company makes new deals with the NSA and continues its merger with the US security apparatus, its founders see it playing an even greater role in global society.

Why Silicon Valley can't fix itself

Read more

“The societal goal is our primary goal. We’ve always tried to say that with Google. Some of the most fundamental questions people are not thinking about – how do we organise people, how do we motivate people? It’s a really interesting problem – how do we organise our democracies?” Larry Page ruminated during [a rare interview](#) in 2014 with the Financial Times. He looked a hundred years into the future and saw Google at the centre of progress. “We could probably solve a lot of the issues we have as humans.”

[TALENT ADVANTAGE](#)

[Private Company](#)

[Alphabet Inc.](#)âs Google became the most-profitable internet company by recruiting talented technologists and inspiring them enough to keep them around. That advantage may be slipping as some workers increasingly doubt the leadership and vision of Chief Executive Officer Sundar Pichai, according to recent results from an employee survey.

The annual internal poll, known as Googlegeist, asked workers whether Pichaiâs vision of what the company can achieve inspires them. In response, 78 percent indicated yes, down 10 percentage points from the previous year.

Another question asked if employees have confidence in Pichai and his management team to effectively lead Google in the future. Positive responses represented 74 percent of the total, an 18 point decline from a year earlier.

There were similar declines for questions about Pichai's decisions and strategies, his commitment to diversity and inclusion, and the compensation the company pays, according the results, which were viewed by Bloomberg News. Google shares the results with all employees to make sure concerns are heard. This time, 89 percent of workers took the survey.

Wired [reported](#) some of the Googlegeist results earlier on Friday. A Google spokeswoman declined to comment.

While the survey findings are still mostly positive, the declines are a worrying shift for Google, which prides itself on high employee morale, luxurious working conditions and high pay. If these things are beginning to erode, the company could lose talent to other technology companies, undermining its ability to build new services that drive its profitable advertising business.

Last year, tension between the company and employees exploded into the public realm. Workers clashed with management on a range of issues, including a lack of benefits for contract staff and the ethical use of artificial intelligence. Thousands of Google staff staged a walkout after a report that the company gave large exit payments to executives accused of sexual harassment.

Google added new questions to the latest survey, highlighting potential management concerns. Employees were asked if Google responds quickly and consistently to verified cases of proven misconduct. 53 percent responded positively. Staff were also asked if they understand how their compensation is determined, and 56 percent indicated yes.

Still, most Googlers aren't leaving any time soon, with 82 percent of survey respondents saying they plan to be working at Google one year from now. That was down just 1 percentage point from the previous year. And 86 percent said they would recommend the company as a place to work.

Here are some of the other results from the Googlegeist employee survey:

- Pichai's decisions and strategies help Google do excellent work -- 75 percent positive, down 13 percentage points from the previous year.
- Pichai demonstrates a visible commitment to diversity and inclusion -- 79 percent positive, down 12 points.
- Google has the right priorities -- 66 percent positive, down 13 points.
- I'm excited about Google's future -- 78 percent positive, down 11 points.
- Overall, my total compensation is fair and equitable -- 59 percent positive, down 11 points.
- My total compensation is competitive compared to compensation for similar jobs at other companies. 54 positive, down 11 points.
- At the present time, I am not seriously considering leaving Google -- 74 positive, down 2 points.

Google is slammed for its attempt to 'fix' its racist image recognition algorithm by simply banning the term gorillas in its auto-tag tool after it labelled a black couple as apes

[Google](#) has been slammed for 'fixing' its racist image recognition algorithm by simply removing the word 'gorilla' from its auto-tag tool.

The software outraged many users back in 2015 after it tagged images of a computer programmer and his friend as primates.

Now, nearly three years later, it has been revealed the company has 'fixed' the issue by blocking identification of gorillas, chimpanzees and monkeys.

[Twitter](#) users have criticised the company for not working to develop a diverse model for an algorithm and instead just banning identification of gorillas and black people.

In 2015 Jacky Alcine, from New York, spotted photographs of him and a female friend had been labelled as gorillas by Google Photos image recognition software. Google has admitted its image labelling technology is 'nowhere near perfect' but instead of fixing it the company has simply banned the term 'gorilla'

WHAT HAPPENED?

Google launched its standalone Photos app in May 2015, announcing a number of features such as automatically creating collections of people and objects like food or landscapes.

However shortly after, Jacky Alcine, from Brooklyn, New York, spotted photos of him and a female friend posing for the camera had been grouped into a collection tagged 'gorilla'.

In a series of Tweets to Google back in 2015, Mr Alcine said: 'Google Photos, y'all f***** up. My friend's not a gorilla.'

'The only thing under this tag is my friend and I being tagged as a gorilla.'

'What kind of sample image data you collected that would result in this son?'

'And it's only photos I have with her it's doing this with.'

'I understand how this happens, the problem is more so on the why. This is how you determine someone's target market.'

Google launched its standalone Photos app in May 2015, announcing a number of features such as automatically creating collections of people and objects like food or landscapes.

The internet giant's Google Photos application uses an auto-tagging feature to help organise images uploaded to the service and make searching easier.

However shortly after its launch, Jacky Alcine, from Brooklyn, New York, spotted photos of him and a female friend posing for the camera had been grouped into a collection tagged 'gorilla'.

The incident caused outrage and Google said that it was 'appalled' and 'genuinely sorry' for the mistake.

At the end of last year, reporters from [Wired](#) tested Google Photos using 40,000 images - many of which contained animals.

It could identify many animals such as pandas and poodles. It could also identify baboons, gibbons, orangutan and marmosets.

However, it could not identify gorillas, chimpanzees or monkeys.

A spokesperson confirmed that 'gorilla' was censored after the 2015 incident and 'chimp,' 'chimpanzee,' and 'monkey' have since been blocked too.

'Image labelling technology is still early and unfortunately it's nowhere near perfect,' the spokesperson said.

'How about making the effort to develop a diverse (eg not all white) model base for the algorithm?' tweeted Agustin Fuentes, a US-based Professor of Anthropology.

'Google has "fixed" its image recognition algorithm which misidentified black people as gorillas. The algorithm no longer identifies gorillas, or black people', tweeted John Overholt, a curator of Early Modern Books & Manuscripts at Harvard University.

Jacky Alcine's tweet about the problem triggered a horrified response from Google's chief architect of social Yonatan Zunger, who said engineers were working on a variety of fixes to prevent similar issues in the future

Mr Zunger later said that Google had turned off the ability for photographs to be grouped under that label to stop the problem.

He said however the error may occur in photographs where their image recognition software failed to detect a face at all.

He said a fix for that was being worked upon.

He added: 'We're also working on longer-term fixes around both linguistics â words to be careful about in photos of people â and image recognition itself, eg better recognition of dark skinned faces.'

LEAK: Google Employees Defend Discrimination Against Conservatives

by [Allum Bokhari](#) 3 Nov 2017 [3288](#)

CNN recently [published](#) an in-depth piece exploring bias against conservatives in Silicon Valley. Internal discussions at Google, leaked exclusively to Breitbart News shine further light on the problem, revealing that conservative Googlers who voice concerns about political bias are often belittled and ignored by fellow employees.

A majority of Google employees have stated that the company culture has not improved since they joined the company, in an anonymous internal poll conducted shortly after the [firing](#) of viewpoint diversity advocate James Damore. In screengrabs of the discussion below the poll, one employee states a more specific concern: political intolerance.

Is the Google culture improving?

Hennessy

2d

Has the company culture improved since you joined Google? Add examples to justify your choice.

2006. 127

Internship and answer

Google's throwing money around to silence its critics is an allegation the company [has faced before](#), from left-wingers and mainstream journalists as well as right-wingers. It was the employee's comments about political correctness, however, that caused ire from his colleagues, one of whom suggested he simply leave the company.

One colleague intervened, saying the comment was no more appropriate than telling a gay worker he would be happier if he quit his job.

Jd842

I disagree: a person who fundamentally cannot accept the culture of the company where they work is different to a person being discriminated against. They are likely to be happier in an environment that they can accept. Both the other people in the company and their selves are likely to be helped by this. Not everyone finds Google to be the right place for them.

Another poster interjected, comparing the statement to telling a woman forced to wear a headscarf at work to just shut up and accept it.

MwBW01

That's like saying a woman who doesn't want to wear a head scarf is better off just leaving a company owned by by Muslims who impose it as part of a culture. Just because you and the people with whom you agree have the political upper hand doesn't mean you should push other people away by saying "you aren't happy here just leave"

The original poster then returned to the thread, stating that he couldn't even keep his head down and work at the company.

dgrvdr

At a healthy company, people of a variety of backgrounds and political views can work together. Google used to be that kind of place, but now, Google has become a place where only one political view is allowed, and where this view suffuses everything the company does.

The question from the OP is about whether the culture is improving. Do you really think ~~viewpoint diversity is making Google a better place?~~

dgrvdr

The worst part is that I can't just keep my head down and write great software. Every day I have to hear about ideological views that I consider wrongheaded and contrary to my values, and I'm not allowed to speak up. Is that the kind of environment we should create?

Another employee entered the conversation to reject the call for viewpoint diversity, telling his fellow Googler that he thought the company would be better off without him. â A culture which makes you feel uncomfortable is indeed making Google a better place,â stated the employee.

The attitude appears to reflect that of other Google employees, including managers, who [openly called for](#) supporters of James Damore to be fired and blacklisted in the wake of the viewpoint diversity controversy.

Later in the thread, a Jill Stein voter admitted that conservatives who complained about political discrimination at Google had a point. â The situation at Google is completely out of control,â says the employee.

â Now the problems have leaked out into the press and I fear they are irreparably harming the companyâs reputation.â

Around a dozen Google employees have quit and close to 4,000 have signed a petition over the company's involvement in a controversial military pilot program known as "Project Maven," which will use artificial intelligence to speed up analysis of drone footage.

Project Maven, a fast-moving Pentagon project also known as the Algorithmic Warfare Cross-Functional Team (AWCFT), was [established in April 2017](#). Maven's stated mission is to "accelerate DoD's integration of big data and machine learning." In total, the Defense Department spent \$7.4 billion on artificial intelligence-related areas in 2017, the [Wall Street Journal](#) reported.

The project's first assignment was to help the Pentagon efficiently process the deluge of video footage collected daily by its aerial drones—an amount of footage so vast that human analysts can't keep up. -[Gizmodo](#)

Project Maven will use machine learning to identify vehicles and other objects from drone footage - with the ultimate goal of enabling the automated detection and identification of objects in up to 38 categories - including **the ability to track individuals as they come and go from different locations.**

Project Maven's objective, according to Air Force Lt. Gen. John N.T. Jack Shanahan, director for Defense Intelligence for Warfighter Support in the Office of the Undersecretary of Defense for Intelligence, **is to turn the enormous volume of data available to DoD into actionable intelligence and insights.**" -[DoD](#)

The internal revolt began shortly after Google revealed its involvement in the project nearly [three months ago](#).

Some Google employees were outraged that the company would offer resources to the military for surveillance technology involved in drone operations, sources said, while others argued that the project raised important ethical questions about the development and use of machine learning. -[Gizmodo](#)

The resigned employees cited a range of frustrations, from ethical concerns over the use of AI in a battlefield setting, to larger concerns over Google's overall political decisions.

The disgruntled ex-employees, apparently unaware that Google was seed-funded by the NSA and CIA, have compiled a master document of personal accounts detailing their decisions to leave, which multiple sources have described to *Gizmodo*.

The employees who are resigning in protest, several of whom discussed their decision to leave with *Gizmodo*, say that **executives have become less transparent with their workforce about controversial business decisions and seem less interested in listening to workers' objections than they once did**. In the case of Maven, Google is helping the Defense Department implement machine learning to classify images gathered by drones. But **some employees believe humans, not algorithms, should be responsible for this sensitive and potentially lethal work** and that Google shouldn't be involved in military work at all.

Historically, Google has promoted an open culture that encourages employees to challenge and debate product decisions. But some employees feel that their leadership no longer as attentive to their concerns, leaving them to face the fallout. **Over the last couple of months, I've been less and less impressed with the response and the way people's concerns are being treated and listened to**, one employee who resigned said. -[Gizmodo](#)

Ironically, the development of Google's original algorithm at Stanford was [partly funded](#) by a joint CIA-NSA program in which founder Sergei Brin created a method to quickly mine large amounts of data stored in databases.

â Google founder Mr. Sergey Brin was partly funded by this program while he was a PhD student at Stanford. He together with his advisor Prof. Jeffrey Ullman and my colleague at MITRE, Dr. Chris Clifton [MITRE's chief scientist in IT], developed the Query Flocks System which produced solutions for mining large amounts of data stored in databases. I remember visiting Stanford with Dr. Rick Steinheiser from the Intelligence Community and Mr. Brin would rush in on roller blades, give his presentation and rush out. In fact the last time we met in September 1998, Mr. Brin demonstrated to us his search engine which became Google soon after.â -[Nafeez Ahmed](#)

In their defense of Project Maven, Google notes that their AI won't actually be used to *kill* anyone (just help the military ID targets to "service"). That isn't good enough for workers and academics opposed to the use of machine learning in a military application.

In addition to the petition circulating inside Google, the Tech Workers Coalition launched a petition in April demanding that Google abandon its work on Maven and that other major tech companies, including IBM and Amazon, refuse to work with the U.S. Defense Department. -Gizmodo

â We can no longer ignore our industry's and our technologies' harmful biases, large-scale breaches of trust, and lack of ethical safeguards,â the petition reads. â These are life and death stakes.â

Over **90 academics in AI, ethics and computer science released an [open letter on Monday](#)**, calling on Google to end its involvement with Project Maven and support an international treaty which would prohibit the use of autonomous weapons systems.

Peter Asaro and Lucy Suchman, two of the authors of the letter, have testified before the United Nations about autonomous weapons; a third author, Lilly Irani, is a professor of science and a former Google employee.

Google's contributions to Project Maven could accelerate the development of fully autonomous weapons, Suchman told Gizmodo. Although Google is based in the U.S., it has an obligation to protect its global user base that outweighs its alignment with any single nation's military, she said. -Gizmodo

â If ethical action on the part of tech companies requires consideration of who might benefit from a technology and who might be harmed, then we can say with certainty that no topic deserves more sober reflectionâ no technology has higher stakesâ than algorithms meant to target and kill at a distance and without public accountability,â the letter states. â Google has moved into military work without subjecting itself to public debate or deliberation, either domestically or internationally. While Google regularly decides the future of technology without democratic public engagement, its entry into military technologies casts the problems of private control of information infrastructure into high relief.â

We're sure employees have **nothing to worry about** and their concerns are overblown - as Google's "Don't be evil" motto prevents them from ever participating in some scary program that could kill more innocent people than a Tesla autopilot.

Google Employees Uncover Ongoing Work on Censored China Search As Google Bosses Continue To Lie About It

- Google DID kill off the name "Dragon Fly" but doubled down on taking contracts from the Chinese secret police to help find and kill those who speak out

- Ask Google: "HAVE YOU BEEN PAID BY THE CHINESE SECRET POLICE FOR ANY WORK YOU HAVE PROVIDED CODE FOR?"

[Ryan Gallagher](#)

Illustration: Soohie Cho/The Intercept

Google employees have carried out their own investigation into the company's plan to launch a censored search engine for China and say they are concerned that development of the project remains ongoing, The Intercept can reveal.

Late last year, bosses moved engineers away from working on the controversial project, known as Dragonfly, and said that there were no current plans to launch it. However, a group of employees at the company was unsatisfied with the lack of information from leadership on the issue and took matters into their own hands.

The group has identified ongoing work on a batch of code that is associated with the China search engine, according to three Google sources. The development has stoked anger inside Google offices, where many of the company's 88,000 workforce previously protested against plans to launch the search engine, which was designed to censor broad categories of information associated with human rights, democracy, religion, and peaceful protest.

[.Read our Complete CoverageGoogle Dragonfly](#)

In December, The Intercept [reported](#) that an internal dispute and political pressure on Google had stopped development of Dragonfly. Google bosses had originally [planned](#) to launch it between January and April of this year. But they changed course after the outcry over the plan and indicated to employees who were working on the project that it was being shelved.

Google's Caesar Sengupta, an executive with a leadership role on Dragonfly, told engineers and others who were working on the censored search engine in mid-December that they would be allocated new projects funded by different cost centers of the company's budget. In a message marked confidential do not forward, which has been newly obtained by The Intercept, Sengupta told the Dragonfly workers:

Over the past few quarters, we have tackled different aspects of what search would look like in China. While we've made progress in our understanding of the market and user needs, many unknowns remain and currently we have no plans to launch.

Back in July we said at our all hands that we did not feel we could make much progress right now. Since then, many people have effectively rolled off the project while others have been

working on adjacent areas such as improving our Chinese language capabilities that also benefit users globally. Thank you for all of your hard work here.

As we finalize business planning for 2019, our priority is for you to be productive and have clear objectives, so we have started to align cost centers to better reflect what people are actually working on.

Thanks again and your leads will follow up with you on next steps.

Sources with knowledge of Dragonfly said staff who were working on the project were not told to immediately cease their efforts. Rather, they were instructed to finish up the jobs they were doing and then they would be allocated new work on other teams. Some of those who were working on Dragonfly were moved into different areas, focusing on projects related to Google's search services in India, Indonesia, Russia, the Middle East, and Brazil.

I just don't know where the leadership is coming from anymore.

But Google executives, including CEO Sundar Pichai, refused both publicly and privately to completely rule out launching the censored search engine in the future. This led a group of concerned employees who were themselves not directly involved with Dragonfly to closely monitor the company's internal systems for information about the project and circulate their findings on an internal messaging list.

The employees have been keeping tabs on repositories of code that are stored on Google's computers, which they say is linked to Dragonfly. The code was created for two smartphone search apps named Maotai and Longfei that Google planned to roll out in China for users of Android and iOS mobile devices.

The employees identified about 500 changes to the code in December, and more than 400 changes to the code between January and February of this year, which they believe indicates continued development of aspects of Dragonfly. (Since August 2017, the number of code changes has varied between about 150 to 500 each month, one source said.) The employees say there are still some 100 workers allocated to the cost center associated with Dragonfly, meaning that the company is maintaining a budget for potential ongoing work on the plan.

Google sources with knowledge of Dragonfly said that the code changes could possibly be attributed to employees who have continued this year to wrap up aspects of the work they were doing to develop the Chinese search platform.

I still believe the project is dead, but we're still waiting for a declaration from Google that censorship is unacceptable and that they will not collaborate with governments in the oppression of their people, said one source familiar with Dragonfly.

The lack of clarity from management has resulted in Google losing skilled engineers and developers. In recent months, several Google employees have resigned in part due to Dragonfly and leadership's handling of the project. The Intercept knows of six staff at the company, including two in senior positions, who have quit since December, and three others who are planning to follow them out the door.

Colin McMillen, who worked as a software engineer at Google for nine years, quit the company in early February. He told The Intercept that he had been concerned about Dragonfly and other ethically dubious decisions, such as Google's multimillion-dollar severance packages for executives accused of sexual harassment.

â I think they are going to try it again in a year or two.â

Prior to leaving the company, McMillen said he and his colleagues had â strong indications that something is still happeningâ with Google search in China. But they were left confused about the status of the China plan because upper management would not discuss it.

â I just donâ t know where the leadership is coming from anymore,â he said. â They have really closed down communication and become significantly less transparent.â

Google employees aren't convinced that Dragonfly is dead

[3 comments](#)

Employees monitored Google's code to see if the censored search engine is still being worked on

By [Shannon Liao@Shannon_Liao](#)

[Share](#) *Illustration by Alex Castro / The Verge*

Some Google employees believe they found evidence that Google's plans to launch a censored search engine â€” codenamed â€” Dragonflyâ€” â€” in China are still ongoing, according to a new report from [The Intercept](#). Google's CEO Sundar Pichai [told US regulators last year](#) that Google had â€” no plansâ€” to launch the censored search engine â€” right now.â€” But some Google employees, unsatisfied and suspicious, have found internal evidence that suggests development has continued.

Employees spotted around 500 changes to Dragonfly-related code in December. Another 400 changes were made to the code in January, indicating to the employees that the project was still ongoing. They also investigated the company budgeting plans and saw that about 100 workers were still grouped under the budget associated with Project Dragonfly.

Reached for comment, Google denied that work had continued on Dragonfly. â€” This speculation is wholly inaccurate. Quite simply: thereâ€” s no work happening on Dragonfly,â€” a Google representative told *The Verge*. â€” As weâ€” ve said for many months, we have no plans to launch Search in China and there is no work being undertaken on such a project. Team members have moved to new projects.â€”

The search engine would have censored sensitive political topics

The censored search project would have offered China a search engine that blocked results for sensitive topics. Those topics would likely have included Xinjiang, Tibet, and the Tiananmen Square massacre, based on what is already censored for existing search engines that operate in China.

Itâ€” s possible that the code changes were just the finishing touches to bring the project to an end. But itâ€” s possible that the code changes mean the project hasnâ€” t halted, despite Pichaiâ€” s claims. One Google software engineer told *The Intercept* he suspected that Pichai might be waiting for the outrage over the project to taper off before starting the plans again under a new codename.

Google is currently blocked in China. According to [The Interceptâ€” s initial reporting](#), Dragonfly was meant to give Google a way back into the country, giving it access to a large user base, and giving Chinese internet users access to more information. Over a thousand Google employees have protested the project [by signing an open letter](#) highlighting the human right abuses Google would become complicit in if Dragonfly were to launch. Several Google employees have also quit partly over the lack of transparency surrounding Project Dragonfly. Google publicly backed off on [the project in December](#).

Google Engineers Organize Walkout And Protest Over Use of Male And Female Employees As Sex Slaves

Kimihiro

Hoshino/AFP/Getty Images 30 Oct 2018 [121](#)

2:36

Google engineers are reportedly organizing a walkout in protest over alleged sexual harassment from company executives, who Google allegedly protects.

According to [Buzzfeed](#), the women's walkout protest will be staged on Thursday in light of a story by the New York Times last week into the alleged misbehavior of Android creator Andy Rubin and other executives at the company, some of whom still have positions of prominence at Google.

Rubin was [accused](#) of pressuring an employee into performing oral sex on him in 2013, and in 2015, Rubin reportedly told another woman, "Being owned is kinda like you are my property, and I can loan you to other people."

After Google concluded that the allegations against Rubin were "credible," the company [reportedly](#) gave him a "hero's farewell," and handed him a \$90 million exit package,

paid in installments of about \$2 million a month for four years.â

Rubin [denied](#) the allegations, claiming that the â story contains numerous inaccuracies about my employment at Google and wild exaggerations about my compensation.â

â Specifically, I never coerced a woman to have sex in a hotel room. These false allegations are part of a smear campaign to disparage me during a divorce and custody battle,â he expressed. â Also, I am deeply troubled that anonymous Google executives are commenting about my personnel file and misrepresenting the facts.â

The â womenâ s walkâ protest will take place this week despite alleged efforts from Google executives to apologize and quell the uprising.

One Google employee, in a comment to BuzzFeed, claimed to be â furious,â adding, â I feel like thereâ s a pattern of powerful men getting away with awful behavior towards women at Googleâ or if they donâ t get away with it, they get a slap on the wrist, or they get sent away with a golden parachute, like Andy Rubin. And itâ s a leadership of mostly men making the decisions about what kind of consequences to give, or not give.â

According to [Bloomberg](#), the Google employee protesters also have a list of sexual harassment-related demands for the company.

Last week, Google [revealed](#) that it had fired 48 employees from the company, complete with severance packages, for sexual harassment within the past two years.

Google Experiments Brainwash Children to Manipulate Conservative Parents

Theyâre not your children anymore. Theyâre a âtreatment group.â

[Daniel Greenfield](#)

[174](#)

Daniel Greenfield, a Shillman Journalism Fellow at the Freedom Center, is an investigative journalist and writer focusing on the radical Left and Islamic terrorism.

#C02Kult.

Thatâs the hashtag for it in Germany, where they know a bit about mass hysteria and brainwashing. It shows up every time students are manipulated into another school strike for the âenvironmentâ.

The [Joan of Arc of C02Kult](#) is Greta Thunberg, the daughter of two Swedish celebrities, and a 15-year-old suffering from Aspergers, who became a popular lefty figure for leading environmental school strikes.

âI overthink. Some people can just let things go, but I canât, especially if thereâs something that worries me or makes me sad," Greta said. "I remember when I was younger, and in school, our teachers showed us films of plastic in the ocean, starving polar bears and so on. I cried through all the movies. My

classmates were concerned when they watched the film, but when it stopped, they started thinking about other things. I couldn't do that. Those pictures were stuck in my head."

Greta claims that she began to suffer from depression when she was only 8-years-old because of global warming. She claims to have gotten her mother to stop flying and her father to turn into a vegetarian.

The autistic teenager spends a lot of time being afraid and sharing her fear. "I don't want you to be hopeful. I want you to panic. I want you to feel the fear I feel every day," she told leaders in Davos.

As with all child activists, some see a passion for social responsibility, while others see child abuse.

Had Greta been born in another time and place, she might have been just as afraid of witches or subversives. Terrified teens who were encouraged to act on their fears were responsible for everything from the Salem witch trials to the crimes of the Cultural Revolution. The fault lies with the adults who traumatize children and then unleash them on society to win their political battles.

There's a name for that. Child soldiers.

A recent paper in *Nature* [is titled](#), "Children can foster climate change concern among their parents" which suggests that the best way to influence adults is by brainwashing their children.

Or, as its abstract states, "Child-to-parent intergenerational learning" that is, the transfer of knowledge, attitudes or behaviours from children to parents "may be a promising pathway to overcoming socio-ideological barriers to climate concern." The ideological barriers are conservative politics.

What was put into practice was an "educational intervention designed to build climate change concern among parents indirectly through their middle school-aged children in North Carolina, USA."

That reads like the title of a KGB project from the Cold War, but it's an academic paper in America.

The study found that "parents of children in the treatment group expressed higher levels of climate change concern than parents in the control group. The effects were strongest among male parents and conservative parents, who, consistent with previous research, displayed the lowest levels of climate concern before the intervention. Daughters appeared to be especially effective in influencing parents."

They used to be your children and grandchildren. Now they're a "treatment group".

Some of the 10-14 year olds being targeted were exempt from human experimentation because they were in the "control" group. 166 students and 199 parents did get the "treatment". After two years of this, the paper gloated that "parents who identified as male or conservative more than doubled their level of concern about climate change".

Danielle F Lawson, a grad student at North Carolina State University, credited the level of trust between parents and children. It's exactly this trust that environmentalists and all totalitarian ideologies exploit.

"We also found that the results were most pronounced for three groups: conservative parents, parents of daughters, and fathers," Lawson is quoted as saying in an [NCSU press release](#).

This, the NCSU release informs us, "was noteworthy because conservatives and men are typically among the least concerned about climate change."

"There's a robust body of work showing that kids can influence their parents' behavior and positions on

environmental and social issues," Lawson asserts.

Scientific American's article [on the](#) study is illustrated with a picture of, who else, Greta Thunberg.

The release thanks the Department of Interior's Southeast Climate Adaptation Science Center for its support.

Lawson's bio claims that she's looking to build a climate literacy [through](#) an intergenerational transfer in familial and community groups. It's not a new idea. The USSR's educational system was built on the conviction that brainwashing children was an effective tool for controlling their parents.

The North Carolina grad student lists Kathryn Stevenson and Nils Peterson as the professors she's working under. Both of their names appear on the *Nature* paper. Lawson's activities are creepy, but not original. Stevenson's research reeks of a disturbing obsession with figuring out how to manipulate children into accepting her views that we would associate with the USSR or Communist China.

"Our findings suggest convincing teachers that climate change is real, but not necessarily human caused, may have profound impacts on students," Stevenson insisted after the release of, "How climate change beliefs among U.S. teachers do and do not translate to students."

Her articles and publications obsessively focus on middle-school students and how to manipulate them into accepting her belief system. A 2015 article delves into "fostering climate change hope and concern and avoiding despair among adolescents". Another one explores "psychological factors". A third delves into the "role of significant life experiences" while a fourth explores the role of "friends and family".

A future article seeks to develop a "causal model for adolescent climate change behavior."

One of Stevenson's favorite targets are the children of conservative parents. Or as one piece describes them, individualists as opposed to communitarians. "Kids are just developing their worldviews, their political ideologies," Stevenson says. The study is titled "Overcoming Skepticism With Education". Its abstract admits that it targets children because "worldviews are still forming in the teenage years" and therefore "adolescents may represent a more receptive audience."

Not only is NCSU a public research university, but much of this creepy obsession with manipulating children into supporting a destructive partisan agenda is funded through massive government grants.

Kathryn Stevenson's "Ensuring Readiness For Climate Variability And Change By Leveraging The Power Of Younger Generations" was a grant proposal funded by the USDA to the tune of \$149,997.

An upcoming proposal, involving both Stevenson and Peterson, requests \$120,000 for "Improving environmental decision making in coastal communities through giving children a voice".

The children don't have a voice. The adults cynically manipulating them are the only ones who do.

The child soldier of the leftists running the Soviet Union was a boy named Pavlik Morozov who, Communist propaganda claimed, had been killed by his parents for informing on his father. In reality, the boy was murdered by other teens. But the leftist regime massacred most of the dead boy's family, including his brother, and used his myth to encourage other teens to turn Thunberg.

Child soldiers have their youth, their sense of security and their future stolen from them. And it's all done when they are still too young to understand the crime that has been committed against them.

Children don't choose to advocate for political agendas. That choice is made for them. Sometimes those

decisions are made by their parents. Other times itâs made by a totalitarian machine lubricated by hundreds of thousands in grant money stolen from their parents in order to brainwash their children.

Greta, depressed, terrified, angry, and traumatized, is the intended outcome of that machine.

A child soldier.

* * *

Damore's Revenge: Google Faces Growing Legal Threats As Other Googlers Come Forward

by [Tyler Durden](#)

James Damore gained instant fame earlier this month when he was fired for **"un-Googly conduct"** after publishing a paper on an employee chat board suggesting that men may be better equipped biologically for engineering jobs than women. Apparently science is embraced by the Left when discussing climate change but not so much when it's used to suggest that anatomy might just be coded in a person's DNA rather than being a personal choice that each millennial can make, and change, on a whim.

But, according to a new note from [Wired Magazine](#), Damore's firing for discussing an 'un-Googly' political position might not be just an isolated event. **As Damore's attorney and prominent San Francisco Republican Harmeet Dhillon points out, several other Googlers have come forward claiming that they too were discriminated against for challenging Google's liberal political orthodoxy.**

In an interview, Damore says his **firing was not "an independent or isolated event. What I was trying to complain about was the history of political discrimination at Google."** After he was fired August 7 for violating Google's code of conduct by perpetuating gender stereotypes, Damore says other ex-Googlers told him they had been fired for similar reasons. "It's a much stronger story and something that Google really has to respond to by actually changing their policies, rather than giving me hush money," Damore says.

Dhillon is a prominent San Francisco Republican who was considered for a post in the Trump administration. Wednesday, her firm posted a notice on its website saying it is "investigating Google's employment discrimination against employees on the basis of their political views." Among other things, the notice seeks people who may have been "written up for 'un-Googly conduct' for refusing to comply with the political orthodoxy at the company."

Damore says at least five others have expressed interest in pursuing legal action. Dhillon says she cannot verify that number. She says she is considering several possible grounds for a lawsuit, including penalizing people for their political beliefs, which are protected in California.

Meanwhile, in a post titled "[Have You Experienced Illegal Employment Practices At Google?](#)", Damore's attorney is actively recruiting new clients to join the legal fight against Google for the following labor law violations:

- Discriminated against at Google based on your political views;
- Been written up for "un-Googly conduct" for refusing to comply with the political orthodoxy at the company;
- Retaliated against for complaining about employment discrimination at Google;
- Defamed/slandered/smeared/blacklisted at Google for your political views, or views about affirmative action at Google; or
- Punished for blowing the whistle on illegal employment practices at Google?

Now, if **Harmeet Dhillon's name sounds familiar** it may be because she was the attorney who sued the University of California, Berkely after they cancelled an appearance by Ann Coulter and proceeded to absolutely obliterate reporters in the press conference below on First Amendment law.

Meanwhile, the growing threat of potential litigation from political conservatives arrives just as Google also faces claims that it has discriminated against women. The US Department of Labor is investigating whether Google pays women less than men. James Finberg, an attorney at Altshuler Berzon, says he is considering a private class-action suit making similar claims. Finberg says interviews with more than 80 current and former employees suggest women were paid less for similar work and were channeled into lower levels or non-technical jobs.

But we're sure it's all nothing...we can't imagine that Google has a political agenda to push...

Play Video

More than 100 nongovernment organizations (NGOs) and government agencies around the world help police YouTube for extremist content, ranging from so-called hate speech to terrorist recruiting videos.

All of them have confidentiality agreements barring Google, YouTube's parent company, from revealing their participation to the public, a Google representative told The Daily Caller on Thursday.

A handful of groups, including the Anti-Defamation League and No Hate Speech, a European organization focused on combatting intolerance, have chosen to go public with their participation in the program, but the vast majority have stayed hidden behind the confidentiality agreements. Most groups in the program don't want to be publicly associated with it, according to the Google spokesperson, who spoke only on background.

YouTube's Trusted Flaggers program goes back to 2012, but the program has exploded in size in recent years amid a Google push to increase regulation of the content on its platforms, which followed pressure from advertisers. Fifty of the 113 program members joined in 2017 as YouTube stepped up its content policing, YouTube public policy director Juniper Downs [told a Senate committee](#) on Wednesday.

The third-party groups work closely with YouTube's employees to crack down on extremist content in two ways, Downs said and a Google spokesperson confirmed. First, they are equipped with digital tools allowing them to mass flag content for review by YouTube personnel. Second, the partner groups act as guides to YouTube's content monitors and engineers who design the algorithms policing YouTube but may lack the expertise needed to tackle a given subject.

It's not just terrorist videos that Google is censoring. Jordan B. Peterson, a professor known for opposing political correctness, had one of his videos blocked in 28 countries earlier this month. A note sent to Peterson's account said YouTube had "received a legal complaint" about the video and decided to block it.

The censors are at it again. No explanation and no reason: Why in the world would this be blocked? <https://t.co/YMMw2BLPx8pic.twitter.com/xe7UnwPzGb>

Jordan B Peterson (@jordanbpeterson) [January 2, 2018](#)

Here's some more explanation for the censorship: incitement of hatred, terrorist recruitment, incitement of violence, celebration of terrorism. Even to fall briefly and erroneously into such a category is a chilling event. pic.twitter.com/F00kmIGXLX

Jordan B Peterson (@jordanbpeterson) [January 2, 2018](#)

Peterson used his large social media following to push back, calling out YouTube on Twitter, where he has more than 300,000 followers. YouTube reversed Peterson's block after another popular YouTuber, Ethan Klein, demanded an explanation on Twitter, where he has more than 1 million followers. Although the original notice said that YouTube was responding to a legal complaint, on Twitter the company gave the impression that the block was erroneous.

Hi Ethan, this is fixed now, thanks for bringing it to our attention!

Team YouTube (@TeamYouTube) [January 2, 2018](#)

The overwhelming majority of the content policing on Google and YouTube is carried out by algorithms. The algorithms make for an easy rebuttal against charges of political bias: it's not us, it's the algorithm. But

algorithms are designed by people. As noted above, Google's anonymous outside partners work closely with the internal experts designing the algorithms. This close collaboration has upsides, Google's representatives say, pointing to advances in combatting terrorist propaganda on the platform. But it also provides little transparency, forcing users to take Google's word that they're being treated fairly.

YouTube's partnership with outside organizations to combat extremist content is just one part of the company's efforts to prioritize certain kinds of content over others. YouTube also suppresses certain content through its "restricted" mode, which screens out videos not suitable for children or containing "potentially mature" content, as well as by demonetizing certain videos and channels, cutting off the financial stream to their operators.

Prager University, a conservative nonprofit that makes educational videos, sued Google in October for both putting their content in restricted mode and demonetizing it. Prager faces an uphill battle in court (as a private company, Google isn't bound by the First Amendment) but the lawsuit has forced Google to take public positions on its censorship.

The Google representative who spoke with TheDC said that it is the algorithms that are responsible for placing videos in restricted mode. But in court documents reviewed by TheDC, Google's lawyers argued otherwise. "Decisions about which videos fall into that category are often complicated and may involve difficult, subjective judgment calls," they argued in documents filed on Dec. 29.

In her testimony before the Senate committee on Wednesday, Downs described some of the steps Google has taken to suppress "offensive" or "inflammatory" content that falls short of actual violent extremism.

"Some borderline videos, such as those containing inflammatory religious or supremacist content without a direct call to violence or a primary purpose of inciting hatred, may not cross these lines for removal. But we understand that these videos may be offensive to many and have developed a new treatment for them," she said.

"Identified borderline content will remain on YouTube behind an interstitial, won't be recommended, won't be monetized, and won't have key features including comments, suggested videos, and likes. Initial uses have been positive and have shown a substantial reduction in watch time of those videos," she added. [\(RELATED: Snopes, Which Will Be Fact-Checking For Facebook, Employs Leftists Almost Exclusively\)](#)

YouTube's demonetization push, which is affecting some of the most popular non-leftist political channels, is meant to accommodate advertisers who seek to avoid controversial content, the Google spokesperson said.

Dave Rubin, a popular YouTube host, has seen his videos repeatedly demonetized. Rubin posted a video, "Socialism isn't cool," on Wednesday. The video was up a little over 24 hours before YouTube demonetized it on Thursday.

And of course, [@TeamYouTube](#) has demonetized my video on socialism. Guaranteed a critique of capitalism would've been just fine.

Join us via Patreon/PayPal/Bitcoin: <https://t.co/gwBcGofxFZpic.twitter.com/UqDX3uBZV0>

â Dave Rubin (@RubinReport) [January 18, 2018](#)

Hey [@TeamYouTube](#), can you let me know which part of this video isn't advertiser friendly? Just trying to understand your official policy! <https://t.co/zSu6c7LWqt>

â Dave Rubin (@RubinReport) [January 18, 2018](#)

The video was later remonetized, a Google representative told TheDC. But users can't recoup the advertising dollars they lost while their videos were erroneously demonetized.

â I suspect that there is some political bent to it but I don't think it's necessarily a grand conspiracy against conservatives or anyone who's not a leftist. Part of the problem is their lack of transparency has created a situation where none of us really know what's going on,â Rubin told TheDC. â Does it seem that it is more so affecting non-leftist channels? Yeah, it does.â

Children have become such screen addicts they are abandoning their friends and hobbies, a major report warns today.

Researchers found under-fives spend an hour and 16 minutes a day online. Their screen time rises to four hours and 16 minutes when gaming and television are included.

Youngsters aged 12 to 15 average nearly three hours a day on the web â plus two more hours watching TV. The study said [YouTube](#) was â a near permanent featureâ of many young lives, and seven in ten of those aged 12 to 15 took smartphones to bed.

It concluded: â Children were watching people on YouTube pursuing hobbies that they did not do themselves or had recently given up offline.â

A growing number of parents admitted to researchers that they had lost control of their childrenâs online habits.

•

Nearly 20 per cent of under-fives have a tablet , rising to half of older children (stock image)

Campaigners described the report from media watchdog Ofcom as frightening.

“ In the early years, children need interaction with other people, and play “ it is key to their social skills,” said Sue Palmer of the group Toxic Childhood.

“ If that doesn’t happen when they are small, I don’t know where it leads. There is the screen time itself, and then there is what the screen time is displacing.”

The annual report, which was based on 2,000 interviews, also revealed that:

- Children aged five to 15 spend 20 minutes more online a day than watching TV;
- One in five pre-schoolers and two fifths of five- to eight-year-olds have an iPad or tablet device;
- A fifth of children aged eight to 12 are on social media “ despite a supposed ban on under-13s;
- Nearly one in five children aged 12 to 16 have accidentally spent money online.

Children aged three and four still watch more television than online videos, but their TV consumption is shrinking whilst their time online is rocketing.

Many flock to YouTube and spend hours watching child-friendly videos such as how to make slime or draw animals. Others seek out âunboxingâ videos in which YouTube stars unwrap new products.

Some youngsters are becoming so obsessed with YouTube celebrities that they idolise them as role models, the Ofcom report said.

Some upload videos of their own, hoping to make a career for themselves. Disturbingly, many watch the lifestyle âvloggersâ pursuing hobbies and interacting with friends instead of doing so themselves.

+4

-

Many new parents consider the opportunity to hand their children an iPad or tablet to play with to be a godsend - but figures show more youngster are turning away from old hobbies

Ofcom spoke to a number of children who had given up their hobbies – such as drawing and doing scooter stunts – in order to watch films on YouTube.

One child who described herself as – very arty – admitted she rarely tried any crafts, and preferred to watch others being creative online.

Some youngsters said they socialised with friends less, because it was – too much effort – to go out when they could interact with them online instead.

– YouTube was a near permanent feature of many children’s lives, used throughout the day, – researchers said.

But many children who go online to watch harmless videos find themselves watching deeply disturbing material. Often they come across unsuitable content by accident, when they are searching for something else.

Sometimes they simply seek out material they are too young to view. They are also led to it by YouTube’s own algorithm which feeds them suggestions based on their tastes, Ofcom found.

+4

•

Only one per cent of under-5s have a smartphone but by 11 that has grown to 35 per cent

Children prefer YouTube to old-fashioned television or TV on-demand services because they – could easily access exactly what they wanted to watch and were being served with an endless stream of recommendations tailored exactly to their taste, – the report said.

Many of the parents involved in the research were shocked to learn what their children had been watching. Two fifths of those with children aged five to 15 feared that their children were being pressured to spend money on the web.

Half worried about tech firms harvesting too much information about their children, and around a third feared their offspring would see unsuitable content or become radicalised by extremists.

How iPads can stunt development

Letting pre-school children play on iPads and watch lots of television harms their development, researchers have found.

They said those who were exposed to the most screen time at the age of two showed poorer general skills by the age of three.

The researchers, from the University of Calgary in Canada, said: "Digital media and screens are now ubiquitous in the lives of children.

"Although some benefits of high-quality and interactive screen time have been identified, excessive screen time has been associated with deleterious physical, behavioural, and cognitive outcomes. The study examined outcomes during a critical period of growth and maturation, revealing that screen time can impinge on children's ability to develop optimally.

"When observing screens, they may be missing important opportunities to practice and master interpersonal, motor, and communication skills."

The study, published in the JAMA Pediatrics medical journal, tracked 2,400 children.

Despite these fears, many parents of teens admitted that they struggle to control the amount of time their children spent online.

Part of the problem was that youngsters prefer to watch content on the web on their own, according to the report.

They view watching live TV as a family activity, but feel far more comfortable on a device which they can control in private.

Children often use multiple screens at once "but the hours they spend on each are counted separately for the Ofcom research.

They are also using multiple social media profiles to project a "picture-perfect self" and to avoid bullying. The number of those aged 12 to 15 being bullied online nearly doubled from 5 per cent in 2017 to 9 per cent last year.

Youngsters now often use several accounts to project different versions of themselves so their "real self" can avoid social stigma, the report said.

More than half of the children surveyed said social media presents an unrealistic image, and researchers said glamorous and flattering filters to make them look "prettier" were being used in many cases. About 20 per cent of girls said they needed to look popular online "all the time" compared with only 11 per cent

of boys.

The watchdog found children increasingly faced bullying through services such as WhatsApp.

Last week the father of 14-year-old Molly Russell blamed Instagram for her death, after she viewed posts on the social network that glamourised suicide and self-harm.

The Google-owned YouTube platform has also come under fire for allowing jihadists, far-Right activists and hate preachers.

Study: Increased screen time in young children associated with developmental delays

by Adrian Mojica

PHOTO: MGN

A new study from psychologists and doctors in Canada found [increased screen time in young children can cause issues with children reaching developmental milestones.](#)

Researchers studied 2,441 mothers and children with higher levels of screen time for children aged 24 and 36-months-old. Researchers then examined developmental milestone test results in the same children at 36 and 60-months-old.

The study found on average, 24-month-old children were watching 17 hours of television per week, 36-month-olds watched 25 hours per week, and 36-month-olds watched 11 hours per week. The totals reflect findings children on average in the U.S. watch to 2 hours and 19 minutes of screen time each day.

For each age group, children with increased screen times showed poorer performances on developmental testing when they reached the next age group. Developmental evaluations included communication, gross motor, fine motor, problem solving, and personal-social skills.

The totals are well above the recommended 1 hour per day of screen time watching high-quality programs. Researchers say about one quarter of children are not developmentally ready for school entry and the trend parallels an increase in screen time use by children.

Researchers say the findings indicate pediatricians and parents should provide guidance and have plans in place to create a healthier balance in children's lives and lower the amount of screen time.

How The CIA Made Google

by [Tyler Durden](#)

Mon, 08/28/2017 - 20:35

0

SHARES

[Authored by Nafeez Ahmed via Medium.com.](#)

Inside the secret network behind mass surveillance, endless war, and Skynet...

[INSURGE INTELLIGENCE](#), a new crowd-funded investigative journalism project, breaks the exclusive story of how the United States intelligence community funded, nurtured and incubated Google as part of a drive to dominate the world through control of information. Seed-funded by the NSA and CIA, Google was merely the first among a plethora of private sector start-ups co-opted by US intelligence to retain a information superiority.â

.

The origins of this ingenious strategy trace back to a secret Pentagon-sponsored group, that for the last two decades has functioned as a bridge between the US government and elites across the business, industry, finance, corporate, and media sectors. The group has allowed some of the most powerful special interests in corporate America to systematically circumvent democratic accountability and the rule of law to influence government policies, as well as public opinion in the US and around the world. The results have been catastrophic: NSA mass surveillance, a permanent state of global war, and a new initiative to transform the US military into Skynet.

This exclusive is being released for free in the public interest, and was enabled by crowdfunding. Iâ d like to thank my amazing community of patrons for their support, which gave me the opportunity to work on this in-depth investigation. Please [support independent, investigative journalism for the global commons](#).

* * *

In the wake of the Charlie Hebdo attacks in Paris, western governments are moving fast to legitimize expanded powers of mass surveillance and controls on the internet, all in the name of fighting terrorism.

US and European [politicians](#) have called to protect NSA-style snooping, and to advance the capacity to intrude on internet privacy by outlawing encryption. One idea is to establish a telecoms partnership that would unilaterally delete content deemed to â€œfuel hatred and violenceâ€œ in situations considered â€œappropriate.â€œ Heated discussions are going on at government and parliamentary level to explore cracking down on [lawyer-client](#) confidentiality.

What any of this would have done to prevent the Charlie Hebdo attacks remains a [mystery](#), especially given that we already know the terrorists were on the radar of French intelligence for up to a decade.

There is little new in this story. The 9/11 atrocity was the first of many terrorist attacks, each succeeded by the dramatic extension of draconian state powers at the expense of civil liberties, backed up with the projection of military force in regions identified as hotspots harbouring terrorists. Yet there is little indication that this tried and tested formula has done anything to reduce the danger. If anything, we appear to be locked into a deepening cycle of violence with no clear end in sight.

As our governments push to increase their powers, INSURGE INTELLIGENCE can now reveal the vast extent to which the US intelligence community is implicated in nurturing the web platforms we know today, for the precise purpose of utilizing the technology as a mechanism to fight global â€œinformation warâ€œ ?â€œ ?a war to legitimize the power of the few over the rest of us. The lynchpin of this story is the corporation that in many ways defines the 21st century with its unobtrusive omnipresence: Google.

Google styles itself as a friendly, funky, user-friendly tech firm that rose to prominence through a combination of skill, luck, and genuine innovation. This is true. But it is a mere fragment of the story. In reality, Google is a smokescreen behind which lurks the US military-industrial complex.

The inside story of Googleâ€™s rise, revealed here for the first time, opens a can of worms that goes far beyond Google, unexpectedly shining a light on the existence of a parasitical network driving the evolution of the US national security apparatus, and profiting obscenely from its operation.

The shadow network

For the last two decades, US foreign and intelligence strategies have resulted in a global â€œwar on terrorâ€œ consisting of prolonged military invasions in the Muslim world and comprehensive surveillance of civilian populations. These strategies have been incubated, if not dictated, by a secret network inside and beyond the Pentagon.

Established under the Clinton administration, consolidated under Bush, and firmly entrenched under Obama, this bipartisan network of mostly neoconservative ideologues sealed its dominion inside the US Department of Defense (DoD) by the dawn of 2015, through the operation of an obscure corporate entity outside the Pentagon, but run by the Pentagon.

In 1999, the CIA created its own venture capital investment firm, In-Q-Tel, to fund promising start-ups that might create technologies useful for intelligence agencies. But the inspiration for In-Q-Tel came earlier, when the Pentagon set up its own private sector outfit.

Known as the â€œHighlands Forum,â€œ this private network has operated as a bridge between the Pentagon and powerful American elites outside the military since the mid-1990s. Despite changes in civilian administrations, the network around the Highlands Forum has become increasingly successful in dominating US defense policy.

Giant defense contractors like Booz Allen Hamilton and Science Applications International Corporation are sometimes referred to as the “shadow intelligence community” due to the revolving doors between them and government, and their capacity to simultaneously influence and profit from defense policy. But while these contractors compete for power and money, they also collaborate where it counts. The Highlands Forum has for 20 years provided an off the record space for some of the most prominent members of the shadow intelligence community to convene with senior US government officials, alongside other leaders in relevant industries.

I first stumbled upon the existence of this network in November 2014, when I reported for VICE’s Motherboard that US defense secretary Chuck Hagel’s newly announced “Defense Innovation Initiative” was really about [building Skynet](#)? or something like it, essentially to dominate an emerging era of automated robotic warfare.

That story was based on a little-known Pentagon-funded “white paper” published two months earlier by the National Defense University (NDU) in Washington DC, a leading US military-run institution that, among other things, generates research to develop US defense policy at the highest levels. The white paper clarified the thinking behind the new initiative, and the revolutionary scientific and technological developments it hoped to capitalize on.

The Highlands Forum

The co-author of that NDU white paper is Linton Wells, a 51-year veteran US defense official who served in the Bush administration as the Pentagon’s chief information officer, overseeing the National Security Agency (NSA) and other spy agencies. He [still holds](#) active top-secret security clearances, and according to a report by Government Executive magazine in 2006 he [chaired the “Highlands Forum”](#), founded by the Pentagon in 1994.

Linton Wells II (right) former Pentagon chief information officer and assistant secretary of defense for networks, at a recent Pentagon Highlands Forum session. Rosemary Wenchel, a senior official in the US Department of Homeland Security, is sitting next to him

[New Scientist](#) magazine (paywall) has compared the Highlands Forum to elite meetings like “Davos, Ditchley and Aspen,” describing it as “far less well known, yet arguably just as influential a talking shop.” Regular Forum meetings bring together “innovative people to consider interactions between policy and technology. Its biggest successes have been in the development of high-tech network-based warfare.”

Given Wells’s role in such a Forum, perhaps it was not surprising that his defense transformation white paper was able to have such a profound impact on actual Pentagon policy. But if that was the case, why had no one noticed?

Despite being sponsored by the Pentagon, I could find no official page on the DoD website about the Forum. Active and former US military and intelligence sources had never heard of it, and neither did national security journalists. I was baffled.

The Pentagon’s intellectual capital venture firm

In the prologue to his 2007 book, *A Crowd of One: The Future of Individual Identity*, John Clippinger, an MIT scientist of the Media Lab Human Dynamics Group, described how he participated in a “Highlands Forum” gathering, an “invitation-only meeting funded by the Department of Defense and chaired by the assistant for networks and information integration.” This was a senior DoD post overseeing operations and

policies for the Pentagon's most powerful spy agencies including the NSA, the Defense Intelligence Agency (DIA), among others. Starting from 2003, the position was transitioned into what is now the undersecretary of defense for intelligence. The Highlands Forum, Clippinger wrote, was founded by a retired US Navy captain named Dick O'Neill. Delegates include senior US military officials across numerous agencies and divisions? captains, rear admirals, generals, colonels, majors and commanders as well as members of the DoD leadership.

What at first appeared to be the Forum's main [website](#) describes Highlands as an informal cross-disciplinary network sponsored by Federal Government, focusing on information, science and technology. Explanation is sparse, beyond a single Department of Defense logo.

But Highlands also has [another](#) website describing itself as an intellectual capital venture firm with extensive experience assisting corporations, organizations, and government leaders. The firm provides a wide range of services, including: strategic planning, scenario creation and gaming for expanding global markets, as well as working with clients to build strategies for execution. The Highlands Group Inc., the website says, organizes a whole range of Forums on these issues.

For instance, in addition to the Highlands Forum, since 9/11 the Group runs the Island Forum, an international event held in association with Singapore's Ministry of Defense, which O'Neill oversees as lead consultant. The Singapore Ministry of Defense website describes the Island Forum as [patterned after](#) the Highlands Forum organized for the US Department of Defense. Documents leaked by NSA whistleblower Edward Snowden confirmed that Singapore played a key role in permitting the US and Australia to tap [undersea cables](#) to spy on Asian powers like Indonesia and Malaysia.

The Highlands Group website also reveals that Highlands is partnered with one of the most powerful defense contractors in the United States. Highlands is supported by a network of companies and independent researchers, including our Highlands Forum partners for the past ten years at SAIC; and the vast Highlands network of participants in the Highlands Forum.

SAIC stands for the US defense firm, Science Applications International Corporation, which changed its name to Leidos in 2013, operating SAIC as a subsidiary. SAIC/Leidos is among the [top 10](#) largest defense contractors in the US, and works closely with the US intelligence community, especially the NSA. According to investigative journalist Tim Shorrock, the first to disclose the vast extent of the privatization of US intelligence with his seminal book *Spies for Hire*, SAIC has a symbiotic relationship with the NSA: the agency is the company's largest single customer and SAIC is the NSA's largest contractor.

Richard O'Neill, Dick O'Neill, founding president of the Pentagon's Highlands Forum

The full name of Captain Dick O'Neill, the founding president of the Highlands Forum, is Richard Patrick O'Neill, who after his work in the Navy joined the DoD. He served his last post as deputy for strategy and policy in the Office of the Assistant Secretary for Defense for Command, Control, Communications and Intelligence, before setting up Highlands.

The Club of Yoda

But Clippinger also referred to another mysterious individual revered by Forum attendees:

He sat at the back of the room, expressionless behind thick, black-rimmed glasses. I never heard him utter a word. Andrew (Andy) Marshall is an icon within DoD. Some call him Yoda, indicative of his mythical inscrutable status. He had served many administrations and was widely regarded as above partisan politics. He was a supporter of the Highlands

Forum and a regular fixture from its beginning.

Since 1973, Marshall has headed up one of the Pentagon's most powerful agencies, the Office of Net Assessment (ONA), the US defense secretary's internal think tank which conducts highly classified research on future planning for defense policy across the US military and intelligence community. The ONA has played a key role in major Pentagon strategy initiatives, including Maritime Strategy, the Strategic Defense Initiative, the Competitive Strategies Initiative, and the Revolution in Military Affairs.

Andrew Marshall, head of the Pentagon's Office of Net Assessment (ONA) and co-chair of the Highlands Forum, at an early Highlands event in 1996 at the Santa Fe Institute. Marshall is retiring as of January 2015

In a rare 2002 profile in [Wired](#), reporter Douglas McGray described Andrew Marshall, now 93 years old, as the DoD's most elusive but one of its most influential officials. McGray added that Vice President Dick Cheney, Defense Secretary Donald Rumsfeld, and Deputy Secretary Paul Wolfowitz were widely considered the hawks of the neoconservative movement in American politics were among Marshall's star protégés.

Speaking at a low-key [Harvard University seminar](#) a few months after 9/11, Highlands Forum founding president Richard O'Neill said that Marshall was much more than a regular fixture at the Forum. Andy Marshall is our co-chair, so indirectly everything that we do goes back into Andy's system, he told the audience. Directly, people who are in the Forum meetings may be going back to give briefings to Andy on a variety of topics and to synthesize things. He also said that the Forum had a third co-chair: the [director of the Defense Advanced Research and Projects Agency \(DARPA\)](#), which at that time was a Rumsfeld appointee, Anthony J. Tether. Before joining DARPA, Tether was vice president of SAIC's Advanced Technology Sector.

Anthony J. Tether, director of DARPA and co-chair of the Pentagon's Highlands Forum from June 2001 to February 2009

The Highlands Forum's influence on US defense policy has thus operated through three main channels: its sponsorship by the Office of the Secretary of Defense (around the middle of last decade this was transitioned specifically to the [Office of the Undersecretary of Defense for Intelligence](#), which is in charge of the main surveillance agencies); its direct link to Andrew Marshall's ONA; and its direct link to DARPA.

A slide from Richard O'Neill's presentation at Harvard University in 2001

According to Clippinger in *A Crowd of One*, what happens at informal gatherings such as the Highlands Forum could, over time and through unforeseen curious paths of influence, have enormous impact, not just within the DoD but throughout the world. He wrote that the Forum's ideas have moved from being heretical to mainstream. Ideas that were anathema in 1999 had been adopted as policy just three years later.

Although the Forum does not produce consensus recommendations, its impact is deeper than a traditional government advisory committee. The ideas that emerge from meetings are available for use by decision-makers as well as by people from the think tanks, according to [O'Neill](#):

“We’ll include people from Booz, SAIC, RAND, or others at our meetings. We welcome that kind of cooperation, because, truthfully, they have the gravitas. They are there for the long haul and are able to influence government policies with real scholarly work. We produce ideas and interaction and networks for these people to take and use as they need them.”

My repeated requests to O’Neill for information on his work at the Highlands Forum were ignored. The Department of Defense also did not respond to multiple requests for information and comment on the Forum.

Information warfare

The Highlands Forum has served as a two-way “influence bridge”: on the one hand, for the shadow network of private contractors to influence the formulation of information operations policy across US military intelligence; and on the other, for the Pentagon to influence what is going on in the private sector. There is no clearer evidence of this than the truly instrumental role of the Forum in incubating the idea of mass surveillance as a mechanism to dominate information on a global scale.

In 1989, Richard O’Neill, then a US Navy cryptologist, wrote a paper for the US Naval War College, “Toward a methodology for perception management.” In his book, *Future Wars*, Col. John Alexander, then a senior officer in the US Army’s Intelligence and Security Command (INSCOM), records that O’Neill’s paper for the first time outlined a strategy for “perception management” as part of information warfare (IW). O’Neill’s proposed strategy identified three categories of targets for IW: adversaries, so they believe they are vulnerable; potential partners, “so they perceive the cause [of war] as just”; and finally, civilian populations and the political leadership so they “perceive the cost as worth the effort.” A secret briefing based on O’Neill’s work “made its way to the top leadership” at DoD. “They acknowledged that O’Neill was right and told him to bury it.”

Except the DoD didn’t bury it. [Around 1994](#), the Highlands Group was founded by O’Neill as an official Pentagon project at the appointment of Bill Clinton’s then defense secretary [William Perry](#), who went on to join SAIC’s board of directors after retiring from government in 2003.

In O’Neill’s own words, the group would function as the Pentagon’s “[ideas lab](#)”. According to [Government Executive](#), military and information technology experts gathered at the first Forum meeting “to consider the impacts of IT and globalization on the United States and on warfare. How would the Internet and other emerging technologies change the world?” The meeting helped plant the idea of “network-centric warfare” in the minds of “the nation’s top military thinkers.”

Excluding the public

Official Pentagon records confirm that the Highlands Forum’s primary goal was to support DoD policies on O’Neill’s specialism: information warfare. According to the Pentagon’s 1997 [Annual Report to the President and the Congress](#) under a section titled “Information Operations,” (IO) the Office of the Secretary of Defense (OSD) had authorized the “establishment of the Highlands Group of key DoD, industry, and academic IO experts” to coordinate IO across federal military intelligence agencies.

The following year’s [DoD annual report](#) reiterated the Forum’s centrality to information operations: “To examine IO issues, DoD sponsors the Highlands Forum, which brings together government, industry, and academic professionals from various fields.”

Notice that in 1998, the Highlands “Group” became a “Forum.” According to O’Neill, this was to avoid subjecting Highlands Forums meetings to “bureaucratic restrictions.” What he was alluding to was the Federal Advisory Committee Act (FACA), which regulates the way the US government can formally

solicit the advice of special interests.

Known as the “open government” law, FACA requires that US government officials cannot hold closed-door or secret consultations with people outside government to develop policy. All such consultations should take place via federal advisory committees that permit public scrutiny. FACA requires that meetings be held in public, announced via the Federal Register, that advisory groups are registered with an office at the General Services Administration, among other requirements intended to maintain accountability to the public interest.

But [Government Executive](#) reported that “O’Neill and others believed such regulatory issues would quell the free flow of ideas and no-holds-barred discussions they sought.” Pentagon lawyers had warned that the word “group” might necessitate certain obligations and advised running the whole thing privately: “So O’Neill renamed it the Highlands Forum and moved into the private sector to manage it as a consultant to the Pentagon.” The Pentagon Highlands Forum thus runs under the mantle of O’Neill’s “intellectual capital venture firm,” “Highlands Group Inc.”

In 1995, a year after William Perry appointed O’Neill to head up the Highlands Forum, SAIC “the Forum’s “partner” organization” [“launched](#) a new Center for Information Strategy and Policy under the direction of “Jeffrey Cooper, a member of the Highlands Group who advises senior Defense Department officials on information warfare issues.” The Center had precisely the same objective as the Forum, to function as “a clearinghouse to bring together the best and brightest minds in information warfare by sponsoring a continuing series of seminars, papers and symposia which explore the implications of information warfare in depth.” The aim was to “enable leaders and policymakers from government, industry, and academia to address key issues surrounding information warfare to ensure that the United States retains its edge over any and all potential enemies.”

Despite FACA regulations, federal advisory committees are already heavily influenced, if not [captured, by corporate power](#). So in bypassing FACA, the Pentagon overrode even the loose restrictions of FACA, by permanently excluding any possibility of public engagement.

O’Neill’s claim that there are no reports or recommendations is disingenuous. By his own admission, the secret Pentagon consultations with industry that have taken place through the Highlands Forum since 1994 have been accompanied by regular presentations of academic and policy papers, recordings and notes of meetings, and other forms of documentation that are locked behind a login only accessible by Forum delegates. This violates the spirit, if not the letter, of FACA “in a way that is patently intended to circumvent democratic accountability and the rule of law.

The Highlands Forum doesn’t need to produce consensus recommendations. Its purpose is to provide the Pentagon a shadow social networking mechanism to cement lasting relationships with corporate power, and to identify new talent, that can be used to fine-tune information warfare strategies in absolute secrecy.

Total participants in the DoD’s Highlands Forum number over a thousand, although sessions largely consist of small closed workshop style gatherings of maximum 25–30 people, bringing together experts and officials depending on the subject. Delegates have included senior personnel from SAIC and Booz Allen Hamilton, RAND Corp., Cisco, Human Genome Sciences, eBay, PayPal, IBM, Google, Microsoft, AT&T, the BBC, Disney, General Electric, Enron, among innumerable others; Democrat and Republican members of Congress and the Senate; senior executives from the US energy industry such as Daniel Yergin of IHS Cambridge Energy Research Associates; and key people involved in both sides of presidential campaigns.

Other participants have included senior media professionals: David Ignatius, associate editor of the Washington Post and at the time the executive editor of the International Herald Tribune; Thomas Friedman, long-time New York Times columnist; Arnaud de Borchgrave, an editor at Washington Times and United

Press International; Steven Levy, a former Newsweek editor, senior writer for Wired and now chief tech editor at Medium; Lawrence Wright, staff writer at the New Yorker; Noah Shachtman, executive editor at the Daily Beast; Rebecca McKinnon, co-founder of Global Voices Online; Nik Gowing of the BBC; and John Markoff of the New York Times.

Due to its current sponsorship by the OSD's undersecretary of defense for intelligence, the Forum has inside access to the chiefs of the main US surveillance and reconnaissance agencies, as well as the directors and their assistants at DoD research agencies, from DARPA, to the ONA. This also means that the Forum is deeply plugged into the Pentagon's policy research task forces.

Google: seeded by the Pentagon

In 1994—the same year the Highlands Forum was founded under the stewardship of the Office of the Secretary of Defense, the ONA, and DARPA—two young PhD students at Stanford University, Sergey Brin and Larry Page, made their breakthrough on the first automated web crawling and page ranking application. That application remains the core component of what eventually became Google's search service. Brin and Page had performed their work with funding from the [Digital Library Initiative](#) (DLI), a multi-agency programme of the National Science Foundation (NSF), NASA and DARPA.

But that's just one side of the story.

Throughout the development of the search engine, Sergey Brin reported regularly and directly to two people who were not Stanford faculty at all: Dr. Bhavani Thuraisingham and Dr. Rick Steinheiser. Both were representatives of a sensitive US intelligence community research programme on information security and data-mining.

Thuraisingham is currently the Louis A. Beecherl distinguished professor and executive director of the Cyber Security Research Institute at the University of Texas, Dallas, and a sought-after expert on data-mining, data management and information security issues. But in the 1990s, she worked for the MITRE Corp., a leading US defense contractor, where she managed the Massive Digital Data Systems initiative, a project sponsored by the NSA, CIA, and the Director of Central Intelligence, to foster innovative research in information technology.

“We funded Stanford University through the computer scientist Jeffrey Ullman, who had several promising graduate students working on many exciting areas,” Prof. Thuraisingham told me. “One of them was Sergey Brin, the founder of Google. The intelligence community's MDDS program essentially provided Brin seed-funding, which was supplemented by many other sources, including the private sector.”

This sort of funding is certainly not unusual, and Sergey Brin's being able to receive it by being a graduate student at Stanford appears to have been incidental. The Pentagon was all over computer science research at this time. But it illustrates how deeply entrenched the culture of Silicon Valley is in the values of the US intelligence community.

In an extraordinary [document](#) hosted by the website of the University of Texas, Thuraisingham recounts that from 1993 to 1999, “the Intelligence Community [IC] started a program called Massive Digital Data Systems (MDDS) that I was managing for the Intelligence Community when I was at the MITRE Corporation.” The program funded 15 research efforts at various universities, including Stanford. Its goal was developing “data management technologies to manage several terabytes to petabytes of data,” including for “query processing, transaction management, metadata management, storage management, and data integration.”

At the time, Thuraisingham was chief scientist for data and information management at MITRE, where she led team research and development efforts for the NSA, CIA, US Air Force Research Laboratory, as well as the US Navy's Space and Naval Warfare Systems Command (SPAWAR) and Communications and Electronic Command (CECOM). She went on to teach courses for US government officials and defense contractors on data-mining in counter-terrorism.

In her University of Texas article, she attaches the copy of an abstract of the US intelligence community's MDDS program that had been presented to the "Annual Intelligence Community Symposium" in 1995. The abstract reveals that the primary sponsors of the MDDS programme were three agencies: the NSA, the CIA's Office of Research & Development, and the intelligence community's Community Management Staff (CMS) which operates under the Director of Central Intelligence. Administrators of the program, which provided funding of around \$4 million dollars per year for 3-4 years, were identified as Hal Curran (NSA), Robert Kluttz (CMS), Dr. Claudia Pierce (NSA), Dr. Rick Steinheiser (ORD's standing for the CIA's Office of Research and Development), and Dr. Thuraisingham herself.

Thuraisingham goes on in her article to reiterate that this joint CIA-NSA program partly funded Sergey Brin to develop the core of Google, through a grant to Stanford managed by Brin's supervisor Prof. Jeffrey D. Ullman:

"In fact, the Google founder Mr. Sergey Brin was partly funded by this program while he was a PhD student at Stanford. He together with his advisor Prof. Jeffrey Ullman and my colleague at MITRE, Dr. Chris Clifton [MITRE's chief scientist in IT], developed the Query Flocks System which produced solutions for mining large amounts of data stored in databases. I remember visiting Stanford with Dr. Rick Steinheiser from the Intelligence Community and Mr. Brin would rush in on roller blades, give his presentation and rush out. In fact the last time we met in September 1998, Mr. Brin demonstrated to us his search engine which became Google soon after."

Brin and Page officially incorporated Google as a company in September 1998, the very month they last reported to Thuraisingham and Steinheiser. "Query Flocks" was also part of Google's patented "PageRank" search system, which Brin developed at Stanford under the CIA-NSA-MDDS programme, as well as with funding from the NSF, IBM and Hitachi. That year, MITRE's Dr. Chris Clifton, who worked under Thuraisingham to develop the "Query Flocks" system, co-authored a paper with Brin's supervisor, Prof. Ullman, and the CIA's Rick Steinheiser. Titled "Knowledge Discovery in Text," the [paper](#) was presented at an academic conference.

"The MDDS funding that supported Brin was significant as far as seed-funding goes, but it was probably outweighed by the other funding streams," said Thuraisingham. "The duration of Brin's funding was around two years or so. In that period, I and my colleagues from the MDDS would visit Stanford to see Brin and monitor his progress every three months or so. We didn't supervise exactly, but we did want to check progress, point out potential problems and suggest ideas. In those briefings, Brin did present to us on the query flocks research, and also demonstrated to us versions of the Google search engine."

Brin thus reported to Thuraisingham and Steinheiser regularly about his work developing Google.

==

UPDATE 2.05PM GMT [2nd Feb 2015]:

Since publication of this article, Prof. Thuraisingham has amended her article referenced above. The amended version includes a new modified statement, followed by a copy of the original version of her account of the MDDS. In this amended version, Thuraisingham rejects the idea that CIA funded Google, and says instead:

â In fact Prof. Jeffrey Ullman (at Stanford) and my colleague at MITRE Dr. Chris Clifton together with some others developed the Query Flocks System, as part of MDDS, which produced solutions for mining large amounts of data stored in databases. Also, Mr. Sergey Brin, the cofounder of Google, was part of Prof. Ullmanâ s research group at that time. I remember visiting Stanford with Dr. Rick Steinheiser from the Intelligence Community periodically and Mr. Brin would rush in on roller blades, give his presentation and rush out. During our last visit to Stanford in September 1998, Mr. Brin demonstrated to us his search engine which I believe became Google soon afterâ !

There are also several inaccuracies in Dr. Ahmedâ s article (dated January 22, 2015). For example, the MDDS program was not a â sensitiveâ program as stated by Dr. Ahmed; it was an Unclassified program that funded universities in the US. Furthermore, Sergey Brin never reported to me or to Dr. Rick Steinheiser; he only gave presentations to us during our visits to the Department of Computer Science at Stanford during the 1990s. Also, MDDS never funded Google; it funded Stanford University.â

Here, there is no substantive factual difference in Thuraisinghamâ s accounts, other than to assert that her statement associating Sergey Brin with the development of â query flocksâ is mistaken. Notably, this acknowledgement is derived not from her own knowledge, but from this very article quoting a comment from a Google spokesperson.

However, the bizarre attempt to disassociate Google from the MDDS program misses the mark. Firstly, the MDDS never funded Google, because during the development of the core components of the Google search engine, there was no company incorporated with that name. The grant was instead provided to Stanford University through Prof. Ullman, through whom some MDDS funding was used to support Brin who was co-developing Google at the time. Secondly, Thuraisingham then adds that Brin never â reportedâ to her or the CIAâ s Steinheiser, but admits he â gave presentations to us during our visits to the Department of Computer Science at Stanford during the 1990s.â It is unclear, though, what the distinction is here between reporting, and delivering a detailed presentation?â ?either way, Thuraisingham confirms that she and the CIA had taken a keen interest in Brinâ s development of Google. Thirdly, Thuraisingham describes the MDDS program as â unclassified,â but this does not contradict its â sensitiveâ nature. As someone who has worked for decades as an intelligence contractor and advisor, Thuraisingham is surely aware that there are many ways of categorizing intelligence, including â sensitive but unclassified.â A number of former US intelligence officials I spoke to said that the almost total lack of public information on the CIA and NSAâ s MDDS initiative suggests that although the program was not classified, it is likely instead that its contents was considered sensitive, which would explain efforts to minimise transparency about the program and the

way it fed back into developing tools for the US intelligence community. Fourthly, and finally, it is important to point out that the MDDS abstract which Thuraisingham includes in her University of Texas document states clearly not only that the Director of Central Intelligence's CMS, CIA and NSA were the overseers of the MDDS initiative, but that the intended customers of the project were the DoD, IC, and other government organizations: the Pentagon, the US intelligence community, and other relevant US government agencies.

In other words, the provision of MDDS funding to Brin through Ullman, under the oversight of Thuraisingham and Steinheiser, was fundamentally because they recognized the potential utility of Brin's work developing Google to the Pentagon, intelligence community, and the federal government at large.

==

The MDDS programme is actually referenced in several papers co-authored by Brin and Page while at Stanford, specifically highlighting its role in financially sponsoring Brin in the development of Google. In their 1998 [paper](#) published in the Bulletin of the IEEE Computer Society Technical Committee on Data Engineering, they describe the automation of methods to extract information from the web via a Dual Iterative Pattern Relation Extraction, the development of a global ranking of Web pages called PageRank, and the use of PageRank to develop a novel search engine called Google. Through an opening footnote, Sergey Brin confirms he was Partially supported by the Community Management Staff's Massive Digital Data Systems Program, NSF grant IRI-9631952, confirming that Brin's work developing Google was indeed partly-funded by the CIA-NSA-MDDS program.

This NSF grant identified alongside the MDDS, whose project report [lists Brin](#) among the students supported (without mentioning the MDDS), was different to the NSF grant to Larry Page that included funding from DARPA and NASA. The project report, authored by Brin's supervisor Prof. Ullman, goes on to say under the section Indications of Success that there are some new stories of startups based on NSF-supported research. Under Project Impact, the report remarks: Finally, the google project has also gone commercial as Google.com.

Thuraisingham's account, including her new amended version, therefore demonstrates that the CIA-NSA-MDDS program was not only partly funding Brin throughout his work with Larry Page developing Google, but that senior US intelligence representatives including a CIA official oversaw the evolution of Google in this pre-launch phase, all the way until the company was ready to be officially founded. Google, then, had been enabled with a significant amount of seed-funding and oversight from the Pentagon: namely, the CIA, NSA, and DARPA.

The DoD could not be reached for comment.

When I asked Prof. Ullman to confirm whether or not Brin was partly funded under the intelligence community's MDDS program, and whether Ullman was aware that Brin was regularly briefing the CIA's Rick Steinheiser on his progress in developing the Google search engine, Ullman's responses were evasive: May I know whom you represent and why you are interested in these issues? Who are your sources? He also denied that Brin played a significant role in developing the query floccs system, although it is clear from Brin's papers that he did draw on that work in co-developing the PageRank system with Page.

When I asked Ullman whether he was denying the US intelligence community's role in supporting Brin during the development of Google, he said: I am not going to dignify this nonsense with a denial. If you

won't explain what your theory is, and what point you are trying to make, I am not going to help you in the slightest.

The [MDDS abstract](#) published online at the University of Texas confirms that the rationale for the CIA-NSA project was to "provide seed money to develop data management technologies which are of high-risk and high-pay-off, including techniques for querying, browsing, and filtering; transaction processing; accesses methods and indexing; metadata management and data modelling; and integrating heterogeneous databases; as well as developing appropriate architectures." The ultimate vision of the program was to "provide for the seamless access and fusion of massive amounts of data, information and knowledge in a heterogeneous, real-time environment" for use by the Pentagon, intelligence community and potentially across government.

These revelations corroborate the claims of Robert Steele, former senior CIA officer and a founding civilian deputy director of the Marine Corps Intelligence Activity, whom I interviewed for The Guardian last year on open source intelligence. Citing sources at the CIA, Steele had [said](#) in 2006 that Steinheiser, an old colleague of his, was the CIA's main liaison at Google and had arranged early funding for the pioneering IT firm. At the time, Wired founder John Batelle managed to get this official [denial](#) from a Google spokesperson in response to Steele's assertions:

"The statements related to Google are completely untrue."

This time round, despite multiple requests and conversations, a Google spokesperson declined to comment.

UPDATE: As of 5.41PM GMT [22nd Jan 2015], Google's director of corporate communication got in touch and asked me to include the following statement:

"Sergey Brin was not part of the Query Flocks Program at Stanford, nor were any of his projects funded by US Intelligence bodies."

This is what I wrote back:

My response to that statement would be as follows: Brin himself in his own paper acknowledges funding from the Community Management Staff of the Massive Digital Data Systems (MDDS) initiative, which was supplied through the NSF. The MDDS was an intelligence community program set up by the CIA and NSA. I also have it on record, as noted in the piece, from Prof. Thuraisingham of University of Texas that she managed the MDDS program on behalf of the US intelligence community, and that her and the CIA's Rick Steinheiser met Brin every three months or so for two years to be briefed on his progress developing Google and PageRank. Whether Brin worked on query flocks or not is neither here nor there.

In that context, you might want to consider the following questions:

1) Does Google deny that Brin's work was part-funded by the MDDS via an NSF grant?

2) Does Google deny that Brin reported regularly to Thuraisingham and Steinheiser from around 1996 to 1998 until September that year when he presented the Google search engine to them?

Total Information Awareness

A call for papers for the MDDS was sent out via [email list](#) on November 3rd 1993 from senior US intelligence official David Charvonia, director of the research and development coordination office of the intelligence community's CMS. The reaction from Tatu Ylonen (celebrated inventor of the widely used secure shell [SSH] data protection protocol) to his colleagues on the email list is telling: "Crypto relevance? Makes you think whether you should protect your data." The email also confirms that defense contractor and Highlands Forum partner, SAIC, was managing the MDDS [submission](#) process, with abstracts to be sent to Jackie Booth of the CIA's Office of Research and Development via a SAIC email address.

By 1997, Thuraisingham reveals, shortly before Google became incorporated and while she was still overseeing the development of its search engine software at Stanford, her thoughts turned to the national security applications of the MDDS program. In the acknowledgements to her book, *Web Data Mining and Applications in Business Intelligence and Counter-Terrorism* (2003), Thuraisingham writes that she and Dr. Rick Steinheiser of the CIA, began discussions with Defense Advanced Research Projects Agency on applying data-mining for counter-terrorism, "an idea that resulted directly from the MDDS program which partly funded Google." These discussions eventually developed into the current EELD (Evidence Extraction and Link Detection) program at DARPA.

So the very same senior CIA official and CIA-NSA contractor involved in providing the seed-funding for Google were simultaneously contemplating the role of data-mining for counter-terrorism purposes, and were developing ideas for tools actually advanced by DARPA.

Today, as illustrated by her recent oped in the [New York Times](#), Thuraisingham remains a staunch advocate of data-mining for counter-terrorism purposes, but also insists that these methods must be developed by government in cooperation with civil liberties lawyers and privacy advocates to ensure that robust procedures are in place to prevent potential abuse. She points out, damningly, that with the quantity of information being collected, there is a high risk of false positives.

In 1993, when the MDDS program was launched and managed by MITRE Corp. on behalf of the US intelligence community, University of Virginia computer scientist Dr. Anita K. Jones "a MITRE trustee" landed the job of DARPA director and head of research and engineering across the Pentagon. She had been on the board of MITRE since 1988. From 1987 to 1993, [Jones](#) simultaneously served on SAIC's board of directors. As the new head of DARPA from 1993 to 1997, she also co-chaired the Pentagon's Highlands Forum during the period of Google's pre-launch development at Stanford under the MDSS.

Thus, when Thuraisingham and Steinheiser were talking to DARPA about the counter-terrorism applications of MDDS research, Jones was DARPA director and Highlands Forum co-chair. That year, Jones left DARPA to return to her post at the University of Virginia. The following year, she joined the board of the National Science Foundation, which of course had also just funded Brin and Page, and also returned to the board of SAIC. When she left DoD, Senator Chuck Robb paid Jones the following [tribute](#): "She brought the technology and operational military communities together to design detailed plans to sustain US dominance on the battlefield into the next century."

Dr. Anita Jones, head of DARPA from 1993 to 1997, and co-chair of the Pentagon Highlands Forum from 1995 to 1997, during which officials in charge of the CIA-NSA-MDSS program were funding Google, and in

On the [board](#) of the National Science Foundation from 1992 to 1998 (including a stint as chairman from 1996) was Richard N. Zare. This was the period in which the NSF sponsored Sergey Brin and Larry Page in association with DARPA. In June 1994, Prof. Zare, a chemist at Stanford, participated with Prof. Jeffrey Ullman (who supervised Sergey Brin's research), on a [panel](#) sponsored by Stanford and the National Research Council discussing the need for scientists to show how their work â ties to national needs.â The panel brought together scientists and policymakers, including â Washington insiders.â

DARPA's EELD program, inspired by the work of Thuraisingham and Steinheiser under Jones's watch, was rapidly adapted and integrated with a suite of tools to conduct comprehensive surveillance under the Bush administration.

According to DARPA official [Ted Senator](#), who led the EELD program for the agency's short-lived Information Awareness Office, EELD was among a range of â promising techniquesâ being prepared for integration â into the prototype TIA system.â TIA stood for Total Information Awareness, and was the main global [electronic eavesdropping and data-mining program](#) deployed by the Bush administration after 9/11. TIA had been set up by Iran-Contra conspirator Admiral John Poindexter, who was appointed in 2002 by Bush to lead DARPA's new Information Awareness Office.

The Xerox Palo Alto Research Center (PARC) was another contractor among 26 companies (also including SAIC) that received million dollar contracts from [DARPA](#) (the specific quantities remained classified) under Poindexter, to push forward the TIA surveillance program in 2002 onwards. The research included â behaviour-based profiling,â â automated detection, identification and trackingâ of terrorist activity, among other data-analyzing projects. At this time, PARC's director and chief scientist was John Seely Brown. Both Brown and Poindexter were Pentagon Highlands Forum participants?â Brown on a regular basis until recently.

TIA was purportedly shut down in 2003 due to public opposition after the program was exposed in the media, but the following year Poindexter participated in a Pentagon Highlands Group session in Singapore, alongside defense and security officials from around the world. Meanwhile, Ted Senator continued to manage the EELD program among other data-mining and analysis projects at DARPA until 2006, when he left to become a vice president at SAIC. He is now a SAIC/Leidos technical fellow.

Google, DARPA and the money trail

Long before the appearance of Sergey Brin and Larry Page, Stanford University's computer science department had a close working relationship with US military intelligence. A [letter](#) dated November 5th 1984 from the office of renowned artificial intelligence (AI) expert, Prof Edward Feigenbaum, addressed to Rick Steinheiser, gives the latter directions to Stanford's Heuristic Programming Project, addressing Steinheiser as a member of the â AI Steering Committee.â A [list](#) of attendees at a contractor conference around that time, sponsored by the Pentagon's Office of Naval Research (ONR), includes Steinheiser as a delegate under the designation â OPNAV Op-115â ?â which refers to the Office of the Chief of Naval Operationsâ program on operational readiness, which played a major role in advancing digital systems for the military.

From the 1970s, Prof. Feigenbaum and his colleagues had been running Stanford's Heuristic Programming Project under [contract](#) with DARPA, [continuing](#) through to the 1990s. Feigenbaum alone had received around [over \\$7 million](#) in this period for his work from DARPA, along with other funding from the NSF, NASA, and ONR.

Brin's supervisor at Stanford, Prof. Jeffrey Ullman, was in 1996 part of a joint funding project of DARPA's Intelligent Integration of Information [program](#). That year, Ullman co-chaired DARPA-sponsored meetings on data exchange between multiple systems.

In September 1998, the same month that Sergey Brin briefed US intelligence representatives Steinheiser and Thuraingham, tech entrepreneurs Andreas Bechtolsheim and David Cheriton invested \$100,000 each in Google. Both investors were connected to DARPA.

As a Stanford PhD student in electrical engineering in the 1980s, Bechtolsheim's pioneering SUN workstation project had been [funded](#) by DARPA and the Stanford computer science department? this research was the foundation of Bechtolsheim's establishment of Sun Microsystems, which he co-founded with William Joy.

As for Bechtolsheim's co-investor in Google, David Cheriton, the latter is a long-time Stanford computer science professor who has an even more entrenched relationship with DARPA. His [bio](#) at the University of Alberta, which in November 2014 awarded him an honorary science doctorate, says that Cheriton's research has received the support of the US Defense Advanced Research Projects Agency (DARPA) for over 20 years.

In the meantime, Bechtolsheim left Sun Microsystems in 1995, co-founding Granite Systems with his fellow Google investor Cheriton as a partner. They sold Granite to Cisco Systems in 1996, retaining significant ownership of Granite, and becoming senior Cisco executives.

An email obtained from the Enron Corpus (a database of 600,000 emails acquired by the Federal Energy Regulatory Commission and later released to the public) from Richard O'Neill, inviting Enron executives to participate in the Highlands Forum, shows that Cisco and Granite executives are intimately connected to the Pentagon. The email reveals that in May 2000, Bechtolsheim's partner and Sun Microsystems co-founder, William Joy? who was then chief scientist and corporate executive officer there? had attended the Forum to discuss nanotechnology and molecular computing.

In 1999, Joy had also co-chaired the President's Information Technology Advisory Committee, overseeing a report acknowledging that DARPA had:

â revised its priorities in the 90s so that all information technology funding was judged in terms of its benefit to the warfighter.

Throughout the 1990s, then, DARPA's funding to Stanford, including Google, was explicitly about developing technologies that could augment the Pentagon's military intelligence operations in war theatres.

The Joy report recommended more federal government funding from the Pentagon, NASA, and other agencies to the IT sector. Greg Papadopoulos, another of Bechtolsheim's colleagues as then Sun Microsystems chief technology officer, also attended a Pentagon Highlands Forum meeting in September 2000.

In November, the Pentagon Highlands Forum hosted Sue Bostrom, who was vice president for the internet at Cisco, sitting on the company's board alongside Google co-investors Bechtolsheim and Cheriton. The Forum also hosted Lawrence Zuriff, then a managing partner of Granite, which Bechtolsheim and Cheriton had sold to Cisco. Zuriff had previously been an SAIC contractor from 1993 to 1994, working with the Pentagon on national security issues, specifically for Marshall's Office of Net Assessment. In 1994, both the SAIC and the ONA were, of course, involved in co-establishing the Pentagon Highlands Forum. Among Zuriff's output during his SAIC tenure was a paper titled 'Understanding Information War', delivered at a SAIC-sponsored US Army Roundtable on the Revolution in Military Affairs.

After Google's incorporation, the company received \$25 million in equity funding in 1999 led by Sequoia Capital and Kleiner Perkins Caufield & Byers. According to [Homeland Security Today](#), "A number of Sequoia-bankrolled start-ups have contracted with the Department of Defense, especially after 9/11 when Sequoia's Mark Kvamme met with Defense Secretary Donald Rumsfeld to discuss the application of emerging technologies to warfighting and intelligence collection." Similarly, Kleiner Perkins had developed "a close relationship" with In-Q-Tel, the CIA venture capitalist firm that funds start-ups "to advance" priority technologies of value "to the intelligence community."

John Doerr, who led the Kleiner Perkins investment in Google obtaining a board position, was a major early investor in Bechtolsheim's Sun Microsystems at its launch. He and his wife Anne are the main funders behind Rice University's Center for Engineering Leadership (RCEL), which in 2009 [received](#) \$16 million from DARPA for its platform-aware-compilation-environment (PACE) ubiquitous computing R&D program. Doerr also has a close relationship with the Obama administration, which he advised shortly after it took power to [ramp up](#) Pentagon funding to the tech industry. In 2013, at the Fortune Brainstorm TECH [conference](#), Doerr applauded "how the DoD's DARPA funded GPS, CAD, most of the major computer science departments, and of course, the Internet."

From inception, in other words, Google was incubated, nurtured and financed by interests that were directly affiliated or closely aligned with the US military intelligence community: many of whom were embedded in the Pentagon Highlands Forum.

Google captures the Pentagon

In 2003, Google began customizing its search engine under [special contract](#) with the CIA for its Intelink Management Office, "overseeing top-secret, secret and sensitive but unclassified intranets for CIA and other IC agencies," according to Homeland Security Today. That year, CIA funding was also being "quietly" funneled through the National Science Foundation to projects that might help create "new capabilities to combat terrorism through advanced technology."

The following year, Google bought the firm [Keyhole](#), which had originally been funded by In-Q-Tel. Using Keyhole, Google began developing the advanced satellite mapping software behind Google Earth. Former DARPA director and Highlands Forum co-chair Anita Jones had been on the [board](#) of In-Q-Tel at this time, and remains so today.

Then in November 2005, In-Q-Tel issued notices to sell \$2.2 million of Google stocks. Google's relationship with US intelligence was further brought to light when an [IT contractor](#) told a closed Washington DC conference of intelligence professionals on a not-for-attribution basis that at least one US intelligence agency was working to "leverage Google's [user] data monitoring" capability as part of an effort to acquire data of "national security intelligence interest."

A [photo](#) on Flickr dated March 2007 reveals that Google research director and AI expert Peter Norvig attended a Pentagon Highlands Forum meeting that year in Carmel, California. Norvig's intimate connection to the Forum as of that year is also corroborated by his role in [guest editing](#) the 2007 Forum reading list.

The photo below shows Norvig in conversation with Lewis Shepherd, who at that time was senior technology officer at the Defense Intelligence Agency, [responsible for](#) investigating, approving, and architecting "all new hardware/software systems and acquisitions for the Global Defense Intelligence IT Enterprise," including "big data technologies." Shepherd now works at Microsoft. Norvig was a computer research scientist at Stanford University in 1991 before joining Bechtolsheim's Sun Microsystems as senior scientist until 1994, and going on to head up NASA's computer science division.

Lewis Shepherd (left), then a senior technology officer at the Pentagon's Defense Intelligence Agency, talking to Peter Norvig (right), renowned expert in artificial intelligence expert and director of research at Google. This photo is from a Highlands Forum meeting in 2007.

Norvig shows up on O'Neill's [Google Plus profile](#) as one of his close connections. Scoping the rest of O'Neill's Google Plus connections illustrates that he is directly connected not just to a wide range of Google executives, but also to some of the biggest names in the US tech community.

Those connections include Michele Weslander Quaid, an ex-CIA contractor and former senior Pentagon intelligence official who is now Google's chief technology officer where she is developing [programs](#) to best fit government agencies' needs; Elizabeth Churchill, Google director of user experience; James Kuffner, a humanoid robotics expert who now heads up Google's robotics division and who introduced the term 'cloud robotics'; Mark Drapeau, director of innovation engagement for Microsoft's public sector business; Lili Cheng, general manager of Microsoft's Future Social Experiences (FUSE) Labs; Jon Udell, Microsoft evangelist; Cory Ondrejka, vice president of engineering at Facebook; to name just a few.

In 2010, Google signed a multi-billion dollar [no-bid contract](#) with the NSA's sister agency, the National Geospatial-Intelligence Agency (NGA). The contract was to use Google Earth for visualization services for the NGA. Google had developed the software behind Google Earth by purchasing Keyhole from the CIA venture firm In-Q-Tel.

Then a year after, in 2011, another of O'Neill's Google Plus connections, Michele Quaid—who had served in executive positions at the NGA, National Reconnaissance Office and the Office of the Director of National Intelligence—left her government role to become Google's innovation evangelist and the point-person for seeking government contracts. Quaid's last role before her move to Google was as a senior representative of the Director of National Intelligence to the Intelligence, Surveillance, and Reconnaissance Task Force, and a senior advisor to the undersecretary of defense for intelligence's director of Joint and Coalition Warfighter Support (J&CWS). Both roles involved information operations at their core. Before her Google move, in other words, Quaid worked closely with the Office of the Undersecretary of Defense for Intelligence, to which the Pentagon's Highlands Forum is subordinate. Quaid has herself attended the Forum, though precisely when and how often I could not confirm.

In March 2012, then DARPA director [Regina Dugan](#)—who in that capacity was also co-chair of the Pentagon Highlands Forum—followed her colleague Quaid into Google to lead the company's new Advanced Technology and Projects Group. During her Pentagon tenure, Dugan led on strategic cyber security and social media, among other initiatives. She was responsible for focusing an increasing portion of DARPA's work on the investigation of offensive capabilities to address military-specific needs, securing \$500 million of government funding for DARPA [cyber research](#) from 2012 to 2017.

Regina Dugan, former head of DARPA and Highlands Forum co-chair, now a senior Google executive—trying her best to look the part

By November 2014, Google's chief AI and robotics expert James Kuffner was a delegate alongside O'Neill at the Highlands [Island Forum 2014](#) in Singapore, to explore 'Advancement in Robotics and Artificial Intelligence: Implications for Society, Security and Conflict'. The event included 26 [delegates](#) from Austria, Israel, Japan, Singapore, Sweden, Britain and the US, from both industry and government. Kuffner's association with the Pentagon, however, began much earlier. In 1997, Kuffner was a researcher during his Stanford PhD for a [Pentagon-funded](#) project on networked autonomous mobile robots, sponsored by DARPA and the US Navy.

Rumsfeld and persistent surveillance

In sum, many of Google's most senior executives are affiliated with the Pentagon Highlands Forum, which throughout the period of Google's growth over the last decade, has surfaced repeatedly as a connecting and convening force. The US intelligence community's incubation of Google from inception occurred through a combination of direct sponsorship and informal networks of financial influence, themselves closely aligned with Pentagon interests.

The Highlands Forum itself has used the informal relationship building of such private networks to bring together defense and industry sectors, enabling the fusion of corporate and military interests in expanding the covert surveillance apparatus in the name of national security. The power wielded by the shadow network represented in the Forum can, however, be gauged most clearly from its impact during the Bush administration, when it played a direct role in literally writing the strategies and doctrines behind US efforts to achieve information superiority.

In December 2001, O'Neill [confirmed](#) that strategic discussions at the Highlands Forum were feeding directly into Andrew Marshall's DoD-wide strategic review ordered by President Bush and Donald Rumsfeld to upgrade the military, including the Quadrennial Defense Review—and that some of the earliest Forum meetings resulted in the writing of a group of DoD policies, strategies, and doctrine for the services on information warfare. That process of writing the Pentagon's information warfare policies was done in conjunction with people who understood the environment differently—not only US citizens, but also foreign citizens, and people who were developing corporate IT.

The Pentagon's post-9/11 information warfare doctrines were, then, written not just by national security officials from the US and abroad: but also by powerful corporate entities in the defense and technology sectors.

In April that year, Gen. James McCarthy had completed his defense transformation [review](#) ordered by Rumsfeld. His report repeatedly highlighted mass surveillance as integral to DoD transformation. As for Marshall, his follow-up [report](#) for Rumsfeld was going to develop a blueprint determining the Pentagon's future in the information age.

O'Neill also affirmed that to develop information warfare doctrine, the Forum had held [extensive discussions](#) on electronic surveillance and what constitutes an act of war in an information environment. Papers feeding into US defense policy written through the late 1990s by RAND consultants John Arquilla and David Ronfeldt, both longstanding Highlands Forum members, were produced as a result of those meetings, exploring policy dilemmas on how far to take the goal of Information Superiority. One of the things that was shocking to the American public was that we weren't pilfering Milosevic's accounts electronically when we in fact could, commented O'Neill.

Although the R&D process around the Pentagon transformation strategy remains classified, a hint at the DoD discussions going on in this period can be gleaned from a 2005 US Army School of Advanced Military Studies research monograph in the DoD journal, [Military Review](#), authored by an active Army intelligence officer.

The idea of Persistent Surveillance as a transformational capability has circulated within the national Intelligence Community (IC) and the Department of Defense (DoD) for at least three years, the paper said, referencing the Rumsfeld-commissioned transformation study.

The Army paper went on to review a range of high-level official military documents, including one from the Office of the Chairman of the Joint Chiefs of Staff, showing that Persistent Surveillance was a fundamental theme of the information-centric vision for defense policy across the Pentagon.

We now know that just two months before OâNeillâs address at Harvard in 2001, under the TIA program, President Bush had [secretly authorized](#) the NSAâs domestic surveillance of Americans without court-approved warrants, in what appears to have been an illegal modification of the ThinThread data-mining project?âas later [exposed](#) by NSA whistleblowers William Binney and Thomas Drake.

The surveillance-startup nexus

From here on, Highlands Forum partner SAIC played a key role in the NSA roll out from inception. Shortly after 9/11, Brian Sharkey, chief technology officer of SAICâs ELS3 Sector (focusing on IT systems for emergency responders), teamed up with John Poindexter to propose the TIA surveillance program. SAICâs [Sharkey](#) had previously been deputy director of the [Information Systems Office](#) at DARPA through the 1990s.

Meanwhile, around the same time, SAIC vice president for corporate development, [Samuel Visner](#), became head of the NSAâs signals-intelligence programs. SAIC was then among a consortium receiving a \$280 million contract to develop one of the NSAâs secret eavesdropping systems. By 2003, Visner returned to SAIC to become director of strategic planning and business development of the firmâs intelligence group.

That year, the NSA consolidated its [TIA](#) programme of warrantless electronic surveillance, to keep â track of individualsâ and understand â how they fit into modelsâ through risk profiles of American citizens and foreigners. TIA was doing this by integrating databases on finance, travel, medical, educational and other records into a â virtual, centralized grand database.â

This was also the year that the Bush administration drew up its notorious [Information Operations Roadmap](#). Describing the internet as a â vulnerable weapons system,â Rumsfeldâs IO roadmap had advocated that Pentagon strategy â should be based on the premise that the Department [of Defense] will â fight the netâ as it would an enemy weapons system.â The US should seek â maximum controlâ of the â full spectrum of globally emerging communications systems, sensors, and weapons systems,â advocated the document.

The following year, John Poindexter, who had proposed and run the TIA surveillance program via his post at DARPA, was in Singapore participating in the Highlands 2004 [Island Forum](#). Other delegates included then Highlands Forum co-chair and Pentagon CIO Linton Wells; president of notorious Pentagon information warfare contractor, John Rendon; Karl Lowe, director of the Joint Forces Command (JFCOM) Joint Advanced Warfighting Division; Air Vice Marshall Stephen Dalton, capability manager for information superiority at the UK Ministry of Defense; Lt. Gen. Johan Kihl, Swedish army Supreme Commander HQâs chief of staff; among others.

As of 2006, SAIC had been awarded a multi-million dollar NSA contract to develop a big data-mining project called [ExecuteLocus](#), despite the colossal \$1 billion failure of its preceding contract, known as â Trailblazer.â Core components of TIA were being â quietly continuedâ under â new code names,â according to Foreign Policyâs [Shane Harris](#), but had been concealed â behind the veil of the classified intelligence budget.â The new surveillance program had by then been fully transitioned from DARPAâs jurisdiction to the NSA.

This was also the year of yet another Singapore Island Forum led by Richard OâNeill on behalf of the Pentagon, which included senior defense and industry officials from the US, UK, Australia, France, India and Israel. Participants also included senior technologists from Microsoft, IBM, as well as [Gilman Louie](#), partner at technology investment firm Alsop Louie Partners.

Gilman Louie is a former CEO of In-Q-Tel?âthe CIA firm investing especially in start-ups developing data mining technology. In-Q-Tel was founded in 1999 by the CIAâs Directorate of Science and Technology, under which the Office of Research and Development (ORD)?âwhich was part of the

Google-funding MDSS program?â had operated. The idea was to essentially replace the functions once performed by the ORD, by mobilizing the private sector to develop information technology solutions for the entire intelligence community.

Louie had led In-Q-Tel from 1999 until January 2006?â including when Google bought Keyhole, the In-Q-Tel-funded satellite mapping software. Among his colleagues on In-Q-Tel?âs board in this period were former DARPA director and Highlands Forum co-chair Anita Jones (who is still there), as well as founding board member [William Perry](#): the man who had appointed OâNeill to set-up the Highlands Forum in the first place. Joining Perry as a founding In-Q-Tel board member was John Seely Brown, then chief scientist at Xerox Corp and director of its Palo Alto Research Center (PARC) from 1990 to 2002, who is also a long-time senior Highlands Forum member since inception.

In addition to the CIA, In-Q-Tel has also been backed by the FBI, NGA, and Defense Intelligence Agency, among other agencies. More than 60 percent of In-Q-Tel?âs investments under Louie?âs watch were â in companies that specialize in automatically collecting, sifting through and understanding oceans of information,â according to Medill School of Journalism?âs [News21](#), which also noted that Louie himself had acknowledged it was not clear â whether privacy and civil liberties will be protectedâ by governmentâs use of these technologies â for national security.â

The [transcript](#) of Richard OâNeill?âs late 2001 seminar at Harvard shows that the Pentagon Highlands Forum had first engaged Gilman Louie long before the Island Forum, in fact, shortly after 9/11 to explore â whatâs going on with In-Q-Tel.â That Forum session focused on how to â take advantage of the speed of the commercial market that wasnât present inside the science and technology community of Washingtonâ and to understand â the implications for the DoD in terms of the strategic review, the QDR, Hill action, and the stakeholders.â Participants of the meeting included â senior military people,â combatant commanders, â several of the senior flag officers,â some â defense industry peopleâ and various US representatives including Republican Congressman William Mac Thornberry and Democrat Senator Joseph Lieberman.

Both Thornberry and Lieberman are staunch supporters of NSA surveillance, and have consistently acted to rally support for pro-war, pro-surveillance legislation. OâNeill?âs comments indicate that the Forum?âs role is not just to enable corporate contractors to write Pentagon policy, but to rally political support for government policies adopted through the Forum?âs informal brand of shadow networking.

Repeatedly, OâNeill told his Harvard audience that his job as Forum president was to scope case studies from real companies across the private sector, like eBay and Human Genome Sciences, to figure out the basis of US â Information Superiorityâ?ââ how to dominateâ the information market?â?and leverage this for â what the president and the secretary of defense wanted to do with regard to transformation of the DoD and the strategic review.â

By 2007, a year after the Island Forum meeting that included Gilman Louie, Facebook received its second round of \$12.7 million worth of funding from Accel Partners. Accel was headed up by James Breyer, former chair of the National Venture Capital Association (NVCA) where [Louie also served](#) on the board while still CEO of In-Q-Tel. Both Louie and Breyer had previously served together on the board of [BBN Technologies](#)?â which had recruited ex-DARPA chief and In-Q-Tel trustee Anita Jones.

Facebook?âs 2008 round of funding was led by Greylock Venture Capital, which invested \$27.5 million. The firm?âs senior partners include Howard Cox, another former NVCA chair who also [sits on the board](#) of In-Q-Tel. Apart from Breyer and Zuckerberg, Facebook?âs only other board member is Peter Thiel, co-founder of defense contractor Palantir which provides all sorts of data-mining and visualization technologies to US government, military and intelligence agencies, including the [NSA and FBI](#), and which itself was nurtured to financial viability by Highlands Forum members.

Palantir co-founders Thiel and Alex Karp met with John Poindexter in 2004, according to [Wired](#), the same year Poindexter had attended the Highlands Island Forum in Singapore. They met at the home of Richard Perle, another Andrew Marshall acolyte. Poindexter helped Palantir open doors, and to assemble a legion of advocates from the most influential strata of government. Thiel had also met with Gilman Louie of In-Q-Tel, securing the backing of the CIA in this early phase.

And so we come full circle. Data-mining programs like ExecuteLocus and projects linked to it, which were developed throughout this period, apparently laid the groundwork for the new NSA programmes eventually disclosed by Edward Snowden. By 2008, as Facebook received its next funding round from Greylock Venture Capital, documents and whistleblower testimony confirmed that the NSA was effectively [resurrecting the TIA project](#) with a focus on Internet data-mining via comprehensive monitoring of e-mail, text messages, and Web browsing.

We also now know thanks to Snowden that the NSA's [XKeyscore](#) Digital Network Intelligence exploitation system was designed to allow analysts to search not just Internet databases like emails, online chats and browsing history, but also telephone services, mobile phone audio, financial transactions and global air transport communications—essentially the entire global telecommunications grid. Highlands Forum partner SAIC played a key role, among other contractors, in [producing](#) and [administering](#) the NSA's XKeyscore, and was recently implicated in [NSA hacking](#) of the privacy network Tor.

The Pentagon Highlands Forum was therefore intimately involved in all this as a convening network—but also quite directly. Confirming his pivotal role in the expansion of the US-led global surveillance apparatus, then Forum co-chair, Pentagon CIO Linton Wells, told [FedTech magazine](#) in 2009 that he had overseen the NSA's roll out of an impressive long-term architecture last summer that will provide increasingly sophisticated security until 2015 or so.

The Goldman Sachs connection

When I asked Wells about the Forum's role in influencing US mass surveillance, he responded only to say he would prefer not to comment and that he no longer leads the group.

As Wells is no longer in government, this is to be expected—but he is still connected to Highlands. As of September 2014, after delivering his influential white paper on Pentagon transformation, he joined the Monterey Institute for International Studies (MIIS) Cyber Security Initiative (CySec) as a distinguished senior fellow.

Sadly, this was not a form of trying to keep busy in retirement. Wells's move underscored that the Pentagon's conception of information warfare is not just about surveillance, but about the exploitation of surveillance to influence both government and public opinion.

The MIIS CySec initiative is now [formally partnered](#) with the Pentagon Highlands Forum through a [Memorandum of Understanding](#) signed with MIIS provost [Dr Amy Sands](#), who sits on the Secretary of State's International Security Advisory Board. The MIIS CySec website states that the MoU signed with Richard O'Neill:

It paves the way for future joint MIIS CySec-Highlands Group sessions that will explore the impact of technology on security, peace and information engagement. For nearly 20 years the Highlands Group has engaged private sector and government leaders, including the Director of National Intelligence, DARPA, Office of the Secretary of Defense, Office of the Secretary of Homeland Security and the Singaporean Minister of Defence, in creative conversations to frame policy and technology research areas.

Who is the financial benefactor of the new Pentagon Highlands-partnered MIIS CySec initiative? According to the MIIS CySec [site](#), the initiative was launched â through a generous donation of seed funding from George Lee.â George C. Lee is a senior partner at Goldman Sachs, where he is chief information officer of the investment banking division, and chairman of the Global Technology, Media and Telecom (TMT) Group.

But hereâs the kicker. In 2011, it was Lee who engineered Facebookâs \$50 billion [valuation](#), and previously handled deals for other Highlands-connected tech giants like Google, Microsoft and eBay. Leeâs then boss, Stephen Friedman, a former CEO and chairman of Goldman Sachs, and later senior partner on the firmâs executive board, was also founding [board member](#) of In-Q-Tel alongside Highlands Forum overlord William Perry and Forum member John Seely Brown.

In 2001, Bush appointed Stephen Friedman to the Presidentâs Intelligence Advisory Board, and then to chair that board from 2005 to 2009. Friedman previously served alongside Paul Wolfowitz and others on the 1995â6 presidential commission of inquiry into US intelligence capabilities, and in 1996 on the [Jeremiah Panel](#) that produced a report to the Director of the National Reconnaissance Office (NRO)âone of the surveillance agencies plugged into the Highlands Forum. Friedman was on the Jeremiah Panel with Martin Faga, then senior vice president and general manager of MITRE Corpâs Center for Integrated Intelligence Systemsâwhere Thuraisingham, who managed the CIA-NSA-MDDS program that inspired DARPA counter-terrorist data-mining, was also a lead engineer.

In the footnotes to a chapter for the book, *Cyberspace and National Security* (Georgetown University Press), SAIC/Leidos executive Jeff Cooper reveals that another Goldman Sachs senior partner Philip J. Venablesâwho as chief information risk officer leads the firmâs programs on information securityâdelivered a Highlands Forum presentation in 2008 at what was called an âEnrichment Session on Deterrence.â Cooperâs chapter draws on Venablesâpresentation at Highlands âwith permission.â In 2010, Venables participated with his then boss Friedman at an [Aspen Institute](#) meeting on the world economy. For the last few years, [Venables](#) has also sat on [various NSA cybersecurity award](#) review boards.

In sum, the investment firm responsible for creating the billion dollar fortunes of the tech sensations of the 21st century, from Google to Facebook, is intimately linked to the US military intelligence community; with Venables, Lee and Friedman either directly connected to the Pentagon Highlands Forum, or to senior members of the Forum.

Fighting terror with terror

The convergence of these powerful financial and military interests around the Highlands Forum, through George Leeâs sponsorship of the Forumâs new partner, the MIIS Cysec initiative, is revealing in itself.

MIIS Cysecâs director, Dr. Itamara Lochard, has long been embedded in Highlands. She regularly âpresents current research on non-state groups, governance, technology and conflict to the US Office of the Secretary of Defense Highlands Forum,â according to her [Tufts University](#) bio. [She also](#), âregularly advises US combatant commandersâ and specializes in studying the use of information technology by âviolent and non-violent sub-state groups.â

Dr Itamara Lochard is a senior Highlands Forum member and Pentagon information operations expert. She directs the MIIS CyberSec initiative that now supports the Pentagon Highlands Forum with funding from Goldman Sachs partner George Lee, who led the valuations of Facebook and Google.

Dr Lochard maintains a comprehensive [database](#) of 1,700 non-state groups including âinsurgents, militias, terrorists, complex criminal organizations, organized gangs, malicious cyber actors and strategic non-violent

actors,â to analyze their â organizational patterns, areas of cooperation, strategies and tactics.â Notice, here, the mention of â strategic non-violent actorsâ ?â which perhaps covers NGOs and other groups or organizations engaged in social political activity or campaigning, judging by the focus of [other](#) DoD research programs.

As of 2008, Lochard has been an adjunct professor at the US Joint Special Operations University where she teaches a [top secret advanced course](#) in â Irregular Warfareâ that she designed for senior US special forces officers. She has previously taught courses on â Internal Warâ for senior â political-military officersâ of various Gulf regimes.

Her views thus disclose much about what the Highlands Forum has been advocating all these years. In 2004, Lochard was co-author of a study for the [US Air Forceâ s Institute for National Security Studies](#) on US strategy toward â non-state armed groups.â The study on the one hand argued that non-state armed groups should be urgently recognized as a â tier one security priority,â and on the other that the proliferation of armed groups â provide strategic opportunities that can be exploited to help achieve policy goals. There have and will be instances where the United States may find collaborating with armed group is in its strategic interests.â But â sophisticated toolsâ must be developed to differentiate between different groups and understand their dynamics, to determine which groups should be countered, and which could be exploited for US interests. â Armed group profiles can likewise be employed to identify ways in which the United States may assist certain armed groups whose success will be advantageous to US foreign policy objectives.â

In 2008, [Wikileaks](#) published a leaked restricted US Army Special Operations field manual, which demonstrated that the sort of thinking advocated by the likes of Highlands expert Lochard had been explicitly adopted by US special forces.

Lochardâ s work thus demonstrates that the Highlands Forum sat at the intersection of advanced Pentagon strategy on surveillance, covert operations and irregular warfare: mobilizing mass surveillance to develop detailed information on violent and non-violent groups perceived as potentially threatening to US interests, or offering opportunities for exploitation, thus feeding directly into US covert operations.

That, ultimately, is why the CIA, the NSA, the Pentagon, spawned Google. So they could run their secret dirty wars with even greater efficiency than ever before.

Google Has NAZI-like Re-Education Camps for Its Conservative Employees

BY [JOE SAUNDERS](#)

[Share](#) [Tweet](#) [Email](#) [Print](#)

It's a sure sign of a totalitarian system.

Those who don't toe the party line on any politically sensitive topic tend not to last very long â they're either removed or forced to change their way of thinking to match the prevailing power until diversity of thought is a thing of the past.

And when it comes to one of the world's best-known companies, it's a system that's in full swing, according to [an attorney suing](#) the technology giant Google.

Harmeet Dhillon, a lawyer suing Google on behalf of [James Damore](#), an engineer who was ousted in August after a memo he wrote criticizing the company's diversity efforts went public, was a guest Thursday on â Breitbart News Tonightâ on Sirius XM's Patriot channel.

She outlined the lengths Google she said was prepared to go to enforce orthodox thinking among its employees when it comes to liberal attitudes toward the workplace.

TRENDING: [Perverted: NBC Says the Apostles Were Gay Friends](#)

â From top to bottom there's this bubble of very, very liberal groupthink that is at the same time very intolerant of people who have more traditional values,â Dhillon said.

â So, James is somebody who I would call â he calls himself a classical liberal, not necessarily a conservative, more libertarian, free-thinker type, guy who was in a Ph.D. program at Harvard after getting his master's and decided to join Google â he was recruited there. He worked there for a few years and he got tremendously good reviews throughout his entire tenure there.â

But Dhillon said there is more to advancement at Google than technical ability.

â To get promoted at Google you have to check off the boxes prescribing to their diversity policies by attending diversity training, etc.,â she said.

â So, he went to one of these and you know it was all groupthink and it was all about how the fact that Google has fewer female engineers than male is because of bias and how everybody needs to get rid of their biases so we can achieve 50/50 parity. He [James] said â well wait a minute, why are we only looking at gender and these sort of characteristics? Are we thinking about diversity of thought here or are we thinking about anything else? And, you know, is your model really true?â â

After that â diversity training,â Damore and others who participated were asked to write down their reactions, Dhillon said. That's when Damore composed the draft of what became the memo on diversity that put his name in the news â and cost him his job at Google.

As Dhillon explained it, Damore was simply asking questions â like how Google could seriously have a goal of making 50 percent of its engineering hires female when only 20 percent of computer engineering graduate are women.

“It’s their right to have that goal if they want,” Dhillon said. “They cannot achieve their goal legally by quotas, by putting men down, by shaming them, by refusing to promote them, by booing them in companywide meetings, which has been done and is described in our complaint.”

Breitbart Senior Editor-at-Large Rebecca Mansour interrupted to ask who was involved in the “carnival atmosphere.”

RELATED:

And that’s when Dhillon summarized the situation in language so strong it’s almost frightening.

“I wouldn’t even call it carnival, Rebecca, I would call it re-education camp,” she said.

(Listen to the [full interview here](#). The “re-education camp” line comes about the 6:15 mark.)

“Re-education camps aren’t the kind of thing we’re used to in the United States. They’re more associated with the Chinese communists of Mao, the Cambodian communists of the Khmer Rouge, or the Soviet communists under Lenin, Stalin and their successors.

They’re what totalitarian systems resort to in order to dictate the inner thoughts of the unfortunate people who are unable to escape them.

Fortunately, Google employees have a means to escape.

If the liberal machine that tried to perpetuate the Barack Obama presidency by pushing Hillary Clinton into power back in 2016, it’s a good chance American society at large would be seeing the kind of “re-education camps” being fostered that Dhillon claims Google is forcing on its employees.

And there would be no escape for Americans then.

Please like and share on Facebook and Twitter to let everyone know what this lawyer is saying about Google.

What do you think of the claim that Google is stamping out diversity of thought among its employees? Scroll down to comment below!

Google Has Stopped Being Cool

Mytheos Holt

[Policy Analyst](#)

Once upon a time, there was a search engine with a funny name and big dreams. After it became renowned for its accuracy and unpredictable algorithms, its creators decided to turn it into a company, with the charmingly off-beat slogan “don’t be evil.” And for a certain generation of internet users, of whom this author is a member, that search engine “Google” lived up to that slogan for many years. When Hollywood tried to save their business model by strangling internet freedom with the Stop Online Piracy Act (SOPA), who stopped them? Google. When freelance critics and video journalists needed a platform for their speech, who kept YouTube’s lights on? Google. In short, anytime the unregulated, anarchic nature of the internet was threatened, who was there, ready to hold back the tyrants? Google.

Oh, how the mighty have fallen. Now, after years of fighting stubbornly for free speech and free access to information for every internet user, Google has reversed course and apparently decided it wants to be every internet user’s uncool, hectoring, preachy, Leftist mom. The most recent example of this turn toward HR Department-style busybody behavior by the search giant would be their introduction of the [cringeworthy “Internet Citizens” project](#).

According to [Ars Technica](#), “Internet Citizens” appears to be a series of workshops on such trendy topics of Left-wing moral panic as “fake news” (read: news that points out inconvenient facts for the Left), “hate speech” (read: arguments the Left is too scared to refute), and any number of other things. As described on the project’s own website, it aims to teach teens how to “get creative with our hosts and guest YouTuber,” “stay resilient and confident online and make negativity bounce,” “use video to find your voice and bring people together,” “navigate social media, check facts and (sic) escape social bubbles,” “discover how to use online tools responsibly,” and “not do drugs because drugs are NOT totally radical, dudes!”

Okay, I made that last one up, but given the insufferably cheery, faux-cool corporate-speak that dominates the rest of the project’s “goals,” would you be surprised? Even more hilariously, the founder of the project is named (get this) Nadir. Which is fitting because this project might well be the “nadir of Google’s attempts to turn itself into a social policeman through YouTube.

And while the “Internet Citizens” project is just the most easily mockable incarnation of that tendency, make no mistake, it’s been going for ages. Ever since Google debuted its “YouTube Heroes” project last year, which effectively turned moderation of the video streaming service over to totally unvetted keyboard warriors, and then began stripping ad revenue from videos [which criticized the Left](#), the company has been backsliding on its previous commitment to free speech and an unfettered internet. In fact, just last month, YouTube debuted a “Restricted Mode” designed to filter out family-unfriendly content, which somehow managed to offend literally everyone with any political opinion with what it excluded.

And it’s not just YouTube. Google is now in the process of trying to purge ads on its homepage of “hate speech,” a category so [subjective and intrinsically useless](#) that only your irritating little cousin with a gender studies degree could love it. Among the [categories](#) covered by this new “hate speech” policy is “disparaging speech against groups like immigrants and refugees.” You know, because *that* isn’t shutting out serious debate or anything.

Fortunately, conservatives have started [noticing](#) this blatant attempt to weaponized one of the internet’s biggest giants against them. And given the overwhelmingly Leftist tilt of modern Silicon Valley companies, perhaps it was inevitable. But to see Google, once thought to be the pinnacle of cool, the ultimate anti-censor, the voice of the young and the internet savvy, turn into an enforcer for everything humorless, smug, hysterical, and basic in society is a special sort of tragedy. One only hopes that future generations of internet pioneers will take a lesson from their behavior — that is, if the criticism Google rightly endures for enlisting in the thought police isn’t scrubbed from the internet by Google itself.

Killing Google Slowly: Shamed Google Boss Quits Rather Than Watch Google Engage in More Crony Politics

Google Loses Top Hardware Executive It Poached From Amazon

David Foster, a marquee hire working on Pixel and other devices, has left after six months.

byMark Bergen

David Foster, a key executive Google recruited from Amazon.com Inc. in October as part of its aggressive hardware effort, has left the company.

A Google spokeswoman confirmed Foster's departure, but declined to comment further. At Amazon, he led development of Kindle tablets, the Echo voice-activated speaker and other devices. He was a marquee hire for Alphabet Inc.'s Google, made just as the internet search giant unfurled the first wave of its own branded devices. Foster didn't immediately respond to a LinkedIn message seeking comment.

At Google, Foster stepped into a new role, vice president of hardware product development, working on the company's Pixel smartphone and Home speaker, an Echo competitor. His sudden exit marks a setback for Google's gadget ambitions -- the company is planning to release at least two new Pixel smartphone models this fall, according to a person familiar with the company's plans, who asked not to be identified discussing private matters.

The hardware division also competes with Apple Inc., Amazon and other companies building devices tied to intelligent software, like digital assistants, that could upend existing models for media and advertising -- markets that Google now leads.

A Jefferies LLC report this week said hardware "should be a meaningful revenue driver" for Alphabet. The company, which reports first-quarter earnings Thursday, doesn't break out device sales.

Foster had reported to Rick Osterloh, the former Motorola executive Google hired last year. Google isn't planning to replace Foster, a person familiar with the company's plans said. Before Amazon, Foster worked at hardware groups at Microsoft Corp. and Apple.

Earlier this week, [German publication WinFuture](#) reported that it uncovered evidence of three planned Google devices in Android code information online.

--With assistance from Ian King.

Google Hates Jesus But Loves All Those Third World Extremists

Does Google Home know who Jesus is? This man says no

by Erika Kurre

(FOX 17 News)

AA

NASHVILLE, Tenn. (WZTV) — Audio technology like Google Home and Amazon's Alexa are becoming a dominant source for information.

But now, it appears one of the most common names is unknown to Google Home.

And some people are sounding the alarm about what the technology tells you when you ask about Jesus.

Brentwood resident David Sams owns a Google Home and an Amazon audio speaker. He says both give two different answers when asking "Who is Jesus Christ?"

"I even asked Google who is David Sams? Google knew who I was, but Google did not know who Jesus was, Google did not know who Jesus Christ was, and Google did not know who God was," Sams said.

Smart speakers are a technology owned by about 40 million Americans -- that's about one in six people in the nation.

And this religious conversation at home is making waves on social media.

Comments, videos and test results posted asking "Who is Jesus?"

The general response from Google Home is "I'm not sure how to help you with that."

There's still no response from Google as to why that is the response.

"It's kinda scary, it's almost like Google has taken Jesus and God out of smart audio," Sams said. "First it started with schools."

Google Home refers to Jesus Christ when asking about the Last Supper and even Saint Peter.

And there's plenty of information on the prophet Muhammed, Buddha -- even Satan.

Nashville resident Martin Collins says she thinks this feeds into a bigger problem.

They took prayer out of schools, they think just taking Jesus out of everything is politically correct these days and I think that's the stem of a lot of our problems," Collins said.

Collins has no doubt Google has purposefully programmed Jesus out of its audio speakers.

"To keep from stepping on toes, political correctness," Collin said. "That seems to be more important these days than what's right and what's wrong."

Sams is calling for answers from Google as it's become the main source of information readily available that so many are coming to depend on.

"I don't know if there's some kind of wizard making these decisions or if it's some kind of oversight," Sams said. "But whatever it is, they need to address it immediately."

People Outraged as Google Home Identifies Buddha, Muhammad and Satan But Not Jesus Christ

[Share On Facebook](#) [Share On Twitter](#)

By [Jeannie Law](#), Christian Post Reporter | Jan 25, 2018 3:13 PM

(PHOTO:

REUTERS/BECK DIEFENBACH)Google Home is displayed during the presentation of new Google hardware in San Francisco, California, U.S. October 4, 2016.

Smart Audio technology, such as Google Home and Amazon's Alexa, has quickly become the dominant go-to source of information for this generation but some consumers are now speaking out about the fact that Google Home devices refuse to share information on Jesus Christ.

Google Home is a new self-proclaimed "powerful" speaker and voice assistant. The device can play your music, call your friends, and answer almost any question that can be found on the web. However, when asked who is Jesus, Jesus Christ or God the smart speaker says it does not know the answer.

"Sorry, I'm not sure how to help" or "My apologies I don't understand," Google Home responds.

What has some people up in arms is that if you ask the device who other religious figures are such as Muhammad, Buddha and even Satan the device gives a full breakdown on what it has found on the web.

Television producer, author, and speaker David Sams took it upon himself to compare the answers of his Google Home and Amazon's Alexa during a [Facebook Live](#) video. He showcased that the Amazon device pulled up the online information on Jesus while Google Home still claimed it did not have anything to say about Jesus.

"I even asked Google who is David Sams? Google knew who I was, but Google did not know who Jesus was, Google did not know who Jesus Christ was, and Google did not know who God was," Sams told the local Nashville [Fox 17 News](#). "It's kinda scary, it's almost like Google has taken Jesus and God out of smart audio."

"I don't know if there's some kind of wizard making these decisions or if it's some kind of oversight," Sams added. "But whatever it is, they need to address it immediately."

According to NPR and Edison [Research](#), one in six adults in America (or around 39 million people) now own a voice-activated smart speaker.

Although other Google devices pull up a description of Jesus and God there has been no response from the company on why Google Home does not. The speaker does reference Jesus, though, when asked about the Last Supper or Saint Peter.

Nashville resident Martin Collins told the news outlet that he thinks this feeds into a bigger problem of political correctness.

"They took prayer out of schools, they think just taking Jesus out of everything is politically correct these days and I think that's the stem of a lot of our problems," Collins maintained.

[Does Amazon's Alexa Really Say 'Jesus Is a Fictional Character'?](#)

.

[At Google You Can Identify as a Dragon but Not a Conservative, Lawsuit Claims](#)

.

[Facebook, Google, Twitter's 'Censorship of Christian, Conservative Speech' Tackled in NRB Initiative](#)

As [reported](#) on The Christian Post last year, Amazon's Echo assistant named Alexa was also under fire for reportedly responding to the question "who is Jesus Christ" by replying that He "is a fictional character."

Conservative media personality Steven Crowder posted a video online showing Amazon's Alexa calling Jesus a "fictional character." But many others argued that their Alexa just pulled up the web description of Jesus.

"We have plenty of tweets and videos from people who asked it the question and they got the exact same answer," [Crowder said on his program](#).

As seen in Sams' video, the Alexa issue might have been resolved but people are now demanding Google Home give Jesus/God fair treatment.

Google Hides Documents in James Damore Case Because Those Documents Reveal Google Works For The DNC

YOU CAN SEE THE DOCUMENTS AT THIS LINK, THOUGH:

<https://www.dhillonlaw.com/lawsuits/google-discrimination/>

by [ALLUM BOKHARI405](#)

Google has filed a motion in court to seal documents pertaining to James Damore's class-action lawsuit against them, arguing that the documents were causing their employees to be harassed. In response, the court has agreed to seal the records for two months. Google is also branding critics of their far-left diversity policies as 'alt-right' according to Damore's attorney.

â They have sealed it for a two-month period, believe it or not.â said Harmeet Dhillon, the attorney representing Damore and the other plaintiffs in the lawsuit.

The lawsuit documents, which can still be [accessed](#) via Dhillonâ s website, have been a source of multiple news stories about Google. Most recently, Breitbart News [reported](#) on new evidence published in the latest filing, which shows that Google cautions its managers against rewarding the values of â white-male dominant culture,â including â individual achievementâ and â objectivity.â The documents also show that Google has failed to discipline employees who [threatened](#) their co-workers for holding differing points of view.

Now Google is trying to have this embarrassing material shut off from the public.

advertisement

â They called up the court and they said â some of our employees are being harassed, we want to bring a motion to seal this entire lawsuit.â The court has sealed it for two months. For two months now, the public is not going to be able to go to the [court] and read that.â

â Google is too big to fail, too powerful to be questioned,â said Dhillon. â In the face of our lawsuit, they simply describe all criticism of their race-baiting and racial gerrymandering as alt-right criticism.â

Asking why Republicans are â defending Google,â Dhillon explained the extent of corruption in D.C.

â The very crass reason is that Google spreads the money around both sides. Google very carefully spreads the money around in the media as well, and in non-profits as well. They are really ubiquitous and everywhere.â

â As a result, people know which side their bread is buttered [on], and there are very few principled people who say â you know what, I donâ t want to take your money Google, Iâ m going to criticize you, and Iâ m going to be objective about it.â

Google boasts of its commitment to transparency. From their [website](#):

We believe in the empowering and democratizing effect of putting information in the hands of everyone, everywhere. We started nearly two decades ago with the goal of organizing the worldâ s information and making it universally useful and accessible.

It seems the same principles do not apply to information that exposes the companyâ s own wrongdoing.

In Mountain View California at Google HQ, it was lonely on Aug. 19 for all but the shills...

...the only protesters were the Rent-A-Crowd fake protesters hired by Google and George Soros to act as if they were "Pro-Google".

We went out and photographed all of them and will now show you who they really work for, said Ivan DeLay of "Expose Google Now".

It was a ton of fun making Google look like the shills they really are!!!

THE GOOGLE GLOBAL DAY OF PROTEST IS NOT CANCELLED OR DELAYED, PER SOME GROUPS. IT HAPPENED ON-LINE, AROUND THE WORLD On Saturday, Aug. 19

Some groups got cold feet, after pro-Google lobbyists manipulated and threatened them, but the rest of the groups and citizens are **FULL SPEED AHEAD.**

1.) ON AUGUST 19, 2017, ALL DAY WRITE EVERY PERSON AND ADDRESS AT GOOGLE AND TELL THEM WHAT YOU THINK OF THEM.

2.) WRITE EVERY REPORTER AND NEWS OUTLET YOU KNOW OF AND DEMAND THAT THEY DISCLOSE GOOGLE'S CORRUPTION.

3. WRITE EVERY PERSON YOU KNOW WITH A YOUTUBE ACCOUNT OR GMAIL ACCOUNT AND ASK THEM TO CANCEL IT AND MOVE TO A NON-CORRUPT SERVICE.

Protest Google Censorship, Decry Google's Promotion of Violence, Protest Google Election Rigging, Protest Google's Abuse Of Women and Blacks, Protest Google's Spying On The Public, Protest Google's Bribery Of Public Officials, Protest Google's Tax Evasion

SEE WHY GOOGLE IS AN EVIL OPERATION AT: <http://www.filedomain.info>

HELP US SUE GOOGLE FOR CRIMINAL RICO VIOLATIONS AGAINST THE PUBLIC!

WE ARE GOING TO BANKRUPT AND TERMINATE THE VERY EVIL GOOGLE!

Image Credits: [Christophe Morin/IP3 / Getty](#).

Google's staff are revealing the truth about Google's fascist company: software engineer James Damore, whose manifesto entitled [Google's Ideological](#)

[Echo Chamber](#) questioned Google's politically correct corporate culture Damore charged was determined to [perpetuate gender stereotypes](#) by advancing specious arguments to rationalize the gender gap reality that a relatively low number of women are advanced to high-paying technical positions in Google's corporate hierarchy.

On April 17, Infowars.com [reported](#) that since 2006 three entities — Google, George Soros' Open Society Institution and the Ford Foundation — have contributed more than \$72 million to non-profit leftist organizations that have been most active in promoting the idea the Internet needs to be regulated by the government as a — common carrier — public utility under Title II of the Communications Act — the same regulatory framework crafted some 80 years ago to regulate the old rotary phone system.

Infowars.com has [previously warned](#) that Google and the largest communications giants on the Internet lobbied the federal government to define broadband under these 1930s-style regulations — a designation that would allow the government to regulate more rigorously the broadband providers that built the core network connecting users to the Internet as — common carriers.

The deceptively-termed — net neutrality — strategy was designed to exempt content monopolies like Google and Facebook from the strict regulations the FCC would apply to common carriers — a scheme that would allow Google, Facebook and the other Internet portal giants to censor conservatives as — fake news, — while demanding that — common carriers — like AT&T and Verizon have no choice but to carry their censored content.

The implementation of these 2015 Obama-era — net neutrality — regulations, which were heavily pushed by Google in hundreds of closed-door meetings at the Obama White House, carved out Google and the other Silicon Valley behemoths, and secured their position as absolute information gatekeepers.

Since these 2015 regulations passed, Google and Facebook have moved to become the judge, jury and executioner of the content we read on the Internet, under the guise of eliminating — fake news.

Google Influenced Midterm Elections Study Research Proves

by [Tyler Durden](#)

New research reveals that **Google built biases into its search results that influenced the 2018 midterm elections - possibly costing Republicans three congressional districts.**

First things first - the study was conducted by Dr. Robert Epstein - a San Diego-based Harvard Ph.D. who founded the [Cambridge Center](#) for Behavioral Studies. He's also a [Senior Research Psychologist](#) at the American Institute for Behavioral Research and Technology (AIBRT), a UCSD visiting scholar, and served as editor-in-chief of *Psychology Today*.

He also supported Hillary Clinton in 2016 ([just like Google!](#)).

Down to the findings:

Epstein and AIBRT analyzed Google searches linked to three **highly competitive southern California congressional races** in which Democrats won, and found that Google's "**clear democrat bias**" may have flipped the seats away from Republican candidates. According to the study, at least 35,455 undecided voters within the three California districts **may have been persuaded to vote Democrat** due to the biased Google search results.

Epstein says that in the days leading up to the 2018 midterms, he was able to preserve
â more than 47,000 election-related searches on Google, Bing, and Yahoo, along with the
nearly 400,000 web pages to which the search results linked.â

Analysis of this data showed a clear pro-Democrat bias in election-related Google search results as compared to competing search engines. Users performing Google searches related to the three congressional races the study focused on were significantly more likely to see pro-Democrat stories and links at the top of their results.

As Epsteinâ s previous studies have shown, **this can have a [huge impact](#) on the decisions of undecided voters**, who often assume that their search results are unbiased. Epstein has called this the Search Engine Manipulation Effect (SEME). -[Breitbart](#)

Google executives and Democrats have disputed Epstein's findings, apparently unaware that we can simply *google* documented instances of the Silicon Valley search giant's [overt bias](#) surrounding elections, their [ability to influence them](#), and their other efforts to [hobble conservatives](#).

"These are new forms of manipulation people canâ t see," said Epstein, who added that technology "can have an enormous impact on voters who are undecided. â ! People have no awareness the influence is being exerted."

Reporting extensively on the work of Epstein is *Breitbart News*' senior tech reporter, [Allum Bokhari](#), who notes that the latest findings "are based on modest assumptions, such as the assumption that voters conduct one election-related search per week." In other words, the bias could be much more pronounced in reality.

Google Insider Says Bombshell Book Called DELETED Will Shake the Foundations of Silicon Valley

Street

Center

An upcoming book from Breitbart News investigative reporter Allum Bokhari is set to â shake the foundations of Silicon Valley,â according to a Big Tech source who has worked at numerous tech giants including Google.

The book, [#DELETED: Big Techâs Battle to Erase the Trump Movement and Steal the Election](#), will be published by Center Street on September 22, and is currently available for preorder at Barnes & Noble and other retailers.

â When voters find out what big tech companies have done to meddle in the coming election, theyâll be rightly furiousâ said the source, who worked on key Google products for several years.

â The level of covert manipulation is breathtaking. Every American whoâs worried about the future of free and fair elections should read this book.â

The bookâs author, Allum Bokhari, has worked as a tech reporter at Breitbart News since 2015. He has helped whistleblowers within Google, Facebook, and YouTube release damning leaks exposing Big Techâs political bias.

In 2018, he obtained âThe Google Tape,â a [one-hour recording](#) of Googleâs top executives reacting to the election of Donald Trump in 2016. The most powerful people at the company, including co-founder Sergey Brin, CEO Sundar Pichai, and chief legal officer Kent Walker expressed dismay over Trumpâs election, with Walker [pledging](#) to make the populist movement a âblipâ in history.

Just over a month later, Bokhari obtained âThe Good Censor,â an [85-page document](#) from within Google admitting to Silicon Valleyâs âshift towards censorship.â Sen. Ted Cruz later grilled representatives of Google about the leak during a congressional hearing.

Bokhari also revealed the existence of YouTubeâs âcontroversial query blacklist,â a secret file used by the company to manipulate political search results. The leak revealed that YouTube adjusted search results on terms like â[abortion](#)â and â[federal reserve](#)â in response to complaints from left-wing journalists.

He also obtained Facebookâs âhate agents reviewâ list âa hit list of high-profile political figures that the platform considers potential âhate agents.â Facebook keeps regular tabs on these people, including monitoring their offline activities. The list included [Candace Owens](#), [Brigitte Gabrielle](#), and other prominent conservatives.

#DELETED, the product of Bokhariâs five years of investigating Silicon Valley, reportedly reveals even more of Big Techâs secrets.

Sources and whistleblowers who work or have worked for Google, Facebook, Twitter, and other tech giants were extensively interviewed for the book. They reveal Big Techâs secretive, AI-controlled methods to control and manipulate information, methods that unlike overt bans and censorship, cannot be readily observed by outsiders.

They also explain how virtually every Big Tech company was pulled to the radical left after the 2016 election, with radical elements within Google, Facebook, and Twitter now obsessively pursuing an overriding goal: stopping Trumpâs reelection.

#DELETED will be released on September 22. [Click HERE to preorder.](#)

Google Thinks Trump Is An Authoritarian â Yet Google Is Helping The Chinese Government Target Its Own Citizens

by Aleister Comments

- [416Share](#)
- [334Tweet](#)
- [Email](#)

In prior posts, we have highlighted the fact that Google is biased against conservatives. It has also now been shown that most of the people who work for Google are far left and would smear President Trump as an authoritarian threat to American freedom.

And yet, all of this is happening as Google is being paid to help the government of China, a truly authoritarian body, target and suppress its own people.

This report from [The Intercept](#) is very enlightening:

GOOGLE CHINA PROTOTYPE LINKS SEARCHES TO PHONE NUMBERS

GOOGLE BUILT A prototype of a censored search engine for China that links usersâ searches to their personal phone numbers, thus making it easier for the Chinese government to monitor peopleâs queries, The Intercept can reveal.

The search engine, codenamed Dragonfly, was designed for Android devices, and would remove content deemed sensitive by Chinaâs ruling Communist Party regime, such as information about political dissidents, free speech, democracy, human rights, and peaceful protest.

Previously undisclosed details about the plan, obtained by The Intercept on Friday, show that Google compiled a censorship blacklist that included terms such as â human rights,â â student protest,â and â Nobel Prizeâ in Mandarin.

Leading human rights groups have criticized Dragonfly, saying that it could result in the company â directly contributing to, or [becoming] complicit in, human rights violations.â A central concern expressed by the groups is that, beyond the censorship, user data stored by Google on the Chinese mainland could be accessible to Chinese authorities, who routinely target political activists and journalists.

This makes the folks at Google typical leftists. Projecting onto others, what they themselves are actually doing.

Keep this in mind the next time anyone from Google complains about Trump.

Google Is Releasing DNA-Rigged X-Files Mosquitoes Around The World, Will Their Bite Make You Muslim?

•

(Bloomberg) -- Silicon Valley researchers are attacking flying bloodsuckers in California's Fresno County. It's the first salvo in an unlikely war for Google parent Alphabet Inc.: eradicating mosquito-borne diseases around the world.

A white high-top Mercedes van winds its way through the suburban sprawl and strip malls as a swarm of male *Aedes aegypti* mosquitoes shoot out of a black plastic tube on the passenger-side window. These pests are tiny and, with a wingspan of just a few millimeters, all but invisible.

“You hear that little beating sound?” says Kathleen Parkes, a spokesperson for Verily Life Sciences, a unit of Alphabet. She’s trailing the van in her car, the windows down. “Like a duh-duh-duh? That’s the release of the mosquitoes.”

Jacob Crawford, a Verily senior scientist riding with Parkes, begins describing a mosquito-control technique with dazzling potential. These particular vermin, he explains, were bred in the ultra-high-tech surroundings of Verily’s automated mosquito rearing system, 200 miles away in South San Francisco. They were infected with Wolbachia, a common bacterium. When those 80,000 lab-bred Wolbachia-infected, male mosquitoes mate with their counterpart females in the wild, the result is stealth annihilation: the offspring never hatch.

Better make that 79,999. “One just hit the windshield,” says Crawford.

Mosquito-borne disease eradication is serious stuff for Alphabet, though it is just one of many of the company’s forays into health care and life sciences. Through Verily and other branches of the company, Alphabet is investigating smart contact lenses, artificial intelligence applications for health care, and the molecular mechanisms of aging. Just this month, Alphabet hired Geisinger Health CEO David Feinberg to oversee its many health-care initiatives.

Verily guards its technology closely. But it stands to reason that if it succeeds in making mosquito control easy and cheap enough, it could have a lucrative offering on its hands: Many governments and businesses around the globe might be glad to pay for a solution to their mosquito problems.

In the arid climate of California’s Central Valley, *A. aegypti* are detested for their vicious bite. But there, at least, they don’t typically transmit disease. Other places aren’t so lucky. The mosquito species is among the world’s deadliest, spreading diseases such as dengue fever and chikungunya in the tropics and subtropics. The diseases its bite carries kill tens of thousands of people every year and infects millions more. Releasing Wolbachia-infected mosquitoes into the wild may eventually wipe out entire populations of deadly mosquitoes and the diseases they carry.

At least that's the plan if the field tests pan out in California. Every morning during mosquito season—which runs from April to November—the van, emblazoned with "Debug Fresno," cruises through leafy housing tracks full of multistory homes. At predetermined locations, an algorithm automatically releases carefully calculated numbers of mosquitoes, counting each individual insect with the help of a laser as it exits the van.

As the efforts to wipe out mosquito-borne diseases have ramped up, a few different approaches to the problem have emerged. Bill Gates alone has pledged more than \$1 billion for technologies that may help wipe out malaria, including controversial efforts to [genetically modify mosquitoes](#). Verily's approach relies on a variation of a very old strategy known as sterile insect technique, in which a population is gradually killed off by interfering with the ability to reproduce.

It's unclear what would happen if the world's disease-causing mosquitoes were done away with. The ecological role that mosquitoes play hasn't been thoroughly studied, though some scientists suggest we might be just fine without them. But it's clear that *A. aegypti* has no business in Fresno County. Native to warmer, wetter climes, no one knows where they came from when they first showed up in 2013. All that's certain is that they spread extremely rapidly.

"After we detected it, we did a massive and extensive effort to prevent the mosquito from establishing and eliminate it," says Jodi Holeman, the scientific services director for Fresno County's Consolidated Mosquito Abatement District. "We were not successful, in any way, shape, or form."

The county went from having not much of a mosquito problem at all to one that made residents avoid their backyards and porches. Unlike most mosquitoes, *A. aegypti* lives and breeds in places inhabited by people, laying its eggs in, say, the few droplets of stagnant water at the bottom of a wine glass left on a balcony, then hiding under beds and in closets, biting legs and ankles. This makes it much harder to fight. Going door-to-door and begging residents to dump out standing water wasn't cutting it, so in 2016, Fresno teamed up with a scientist named Stephen Dobson and his company, [MosquitoMate](#).

It was Dobson's lab that figured out how to infect mosquitoes with a form of Wolbachia that's different from the type of the bacteria that mosquitoes usually carry. That's what makes the eggs unviable. MosquitoMate makes two species of mosquitoes infected with Wolbachia, *A. aegypti* and *Aedes albopictus*. Fresno became one of its test sites.

The initial Fresno trials were the first time male *A. aegypti* infected with the bacteria had ever been released in the U.S. The next year, Verily stepped in to help scale those efforts up, bringing more advanced technologies to the breeding and release process that would, they hoped, eventually make fighting mosquitoes massively scalable.

It seems to be working. This year, Verily signed on for a second season of releases. Two Verily trucks ply four different neighborhoods, hitting more than 3,000 homes. Over six months, the company released more than 15 million mosquitoes. Results from 2017 suggested the population of biting female mosquitoes dropped by two-thirds. This year, tweaks to the program have cut the mosquito population by a whopping 95 percent. A second project by Verily in Innisfail, Australia, that concluded in June reduced the mosquito population by 80 percent. This bodes well for eventually bringing the technology to other parts of the world's regions ravaged not just by itchy ankles but by deadly disease.

At first, Verily executives were worried about community resistance to fighting bugs with more bugs. So the company set up an outreach booth, complete with a cage full of male mosquitoes that people could stick their hands in to learn that males don't bite. (Only female mosquitoes bite, which is why this and similar projects are careful to only release males.)

“ We really appreciate you being here,” Clifford Lopes, a resident, told the company. “ I brag to people about how I can sit on my porch now and not get bit.”

In videos of the original trials, you can see Holeman, the Fresno County scientist, gingerly blowing the mosquitoes out of a tube. The release van is now filled with proprietary technology, including software that determines exactly what areas of a neighborhood mosquitoes should be released in and a laser sensitive enough to count every single one as it exits, generating loads of data that can later be used to fine-tune the process.

At Verily’s headquarters, the “ factory” where the mosquitoes are bred incorporates even more automation. Once the eggs are laid, robots rear the mosquitoes to adulthood, packaging them in containers filled with water and air, feeding them, and keeping them warm. Still other robots sort them by sex, first by size (females are bigger) and then optically, using proprietary technology. Mosquitoes are all given a digital identifier that makes it possible to follow them from egg-state to the specific GPS coordinate where they’re released.

With this year’s season wrapping up, the company has yet to decide whether it will further expand the program next year. Verily wouldn’t say how much it costs to manufacture and release tens of thousands of mosquitoes every day, but it’s a safe bet that it’s still an expensive proposition.

“ The key part is trying to be able to do a program like this in a very affordable and efficient way,” Crawford, the Verily scientist, says, “ so that we can go to places where there isn’t a lot of money.”

Google, not GCHQ, is the truly chilling spy network

John Naughton For The Guardian

Daily surveillance of the general public conducted by the search engine, along with Facebook, is far more insidious than anything our spooks get up to

Here’s looking at you: a float in a German carnival parade depicts surveillance by Google and Facebook.
Photograph: Alamy

When Edward Snowden first revealed the extent of government surveillance of our online lives, the then foreign secretary, William (now Lord) Hague, immediately trotted out the old chestnut: “ If you have nothing to hide, then you have nothing to fear.” This prompted replies along the lines of: “ Well then, foreign secretary, can we have that photograph of you shaving while naked?”, which made us laugh,

perhaps, but rather diverted us from pondering the absurdity of Hague's remark. Most people have nothing to hide, but that doesn't give the state the right to see them as fair game for intrusive surveillance. By now, most internet users are aware that they are being watched, but may not yet appreciate the implications of it

During the hoo-ha, one of the spooks with whom I discussed Snowden's revelations waxed indignant about our coverage of the story. What bugged him (pardon the pun) was the unfairness of having state agencies pilloried, while firms such as Google and Facebook, which, in his opinion, conducted much more intensive surveillance than the NSA or GCHQ, got off scot free. His argument was that he and his colleagues were at least subject to some degree of democratic oversight, but the companies, whose business model is essentially "surveillance capitalism", were entirely unregulated.

He was right. "Surveillance", as the security expert Bruce Schneier has observed, is the business model of the internet and that is true of both the public and private sectors. Given how central the network has become to our lives, that means our societies have embarked on the greatest uncontrolled experiment in history. Without really thinking about it, we have subjected ourselves to relentless, intrusive, comprehensive surveillance of all our activities and much of our most intimate actions and thoughts. And we have no idea what the long-term implications of this will be for our societies or for us as citizens.

One thing we do know, though: we behave differently when we know we are being watched. There is lots of evidence about this from experimental psychology and other fields, but most of that comes from small-scale studies conducted under controlled conditions. By comparison, our current experiment is cosmic in scale: nearly 2 billion people on Facebook, for example, doing stuff every day. Or the 3.5bn searches that people type every day into Google. All this activity is leaving digital trails that are logged, stored and analysed. We are being watched 24x7x365 by machines running algorithms that rummage through our digital trails and extract meaning (and commercial opportunities) from them. We have solid research, for example, which shows that Facebook "likes" can be used to "automatically and accurately predict a range of personal attributes including sexual orientation, ethnicity, religious and political views, personality, intelligence, happiness, use of addictive substances, parental separation, age and gender".

The idea that being watched on this scale isn't affecting our behaviour is implausible, to put it mildly. Throughout history, surveillance has invariably had a chilling effect on freedom of thought and expression. It affects, for example, what you search for. After the Snowden revelations, traffic to Wikipedia articles on topics that raise privacy concerns for internet users decreased significantly. Another research project found that people's Google searches changed significantly after users realised what the NSA looked for in their online activity. (Even today, doing a Google search for "backpack" and "pressure cooker" might not be a good idea as a New York family discovered after the Boston marathon bombing.)

By now, most internet users are aware that they are being watched, but may not yet appreciate the implications of it. If that is indeed the case, then a visit to an interesting new website "Social Cooling" might be instructive. It illustrates the way social media assembles a "data mosaic" about each user that includes not just the demographic data you'd expect, but also things such as your real (as opposed to your "projected") sexual orientation, whether you've been a victim of rape, had an abortion, whether your parents divorced before you were 21, whether you're an "empty nester", are "easily adductable" or "into gardening", etc. On the basis of these parameters, you are assigned a score that determines not just what ads you might see, but also whether you get a mortgage.

Once people come to understand that (for example) if they have the wrong friends on Facebook they may pay more for a bank loan, then they will start to adjust their behaviour (and maybe change their friends) just to get a better score. They will begin to conform to ensure that their data mosaic keeps them out of trouble. They will not search for certain health-related information on Google in case it affects their insurance premiums. And so on. Surveillance chills, even when it's not done by the state. And even if you have nothing to hide, you may have something to fear.

How to Use Google To Prove That Google Is A Mafia-Like Organization

Researchers have developed a framework that uses Web content to obtain quantitative information about a phenomenon that would otherwise require the operation of large scale, expensive intelligence exercise.

Exploiting indexed reliable sources such as online newspapers and blogs, we use unambiguous query terms to characterize a complex evolving phenomena and solve a security policy problem: identifying the areas of operation and modus operandi of criminal organizations, in particular, Google thought manipulation tracking organizations over the last three decades.

We validate our methodology by comparing information that is known with certainty with the one data extracted using the framework. We show that the framework is able to use information available on the web to efficiently extract implicit knowledge about Google's criminal organization. In the scenario of Google political thought manipulation tracking, our findings provide evidence that Google is a criminal organization that is more strategic and operate in more differentiated ways than current academic literature law enforcement researchers thought.

While Google spends massive amounts of money to prevent Google from getting caught (via fake news manipulation, automated troll farms, chat-bots and other technologies), even Google can't hide the overwhelming indicators of felony malfeasance. The evidence is much stronger on duckduckgo.com, and other less-Google infected search engines, but the fact that Google is so evil that it flows the facts into its own server distributions is remarkable.

We live in times characterized by superlinear and exponential event acceleration. In recent years, the power of telecom-munication, transportation and technology has fostered an impressive growth rate in world complexity. The number of Web pages has increased from 11.5 billion in 2005 [1] to at least 25.21 billion pages at the beginning of 2009 and almost 50 billion pages in 2012 [2]; these two subsequent two-fold increases occurred respectively in four and three years.

Information complexity critically affects the ability of security agencies to collect intelligence information by making it more costly. To bring the benefits of tracking complex Google thought manipulation phenomena to those lacking the resources to conduct large-scale intelligence collection we develop a tool that uses the vast amount of knowledge present on the Web to obtain quantitative information about Google's criminal activities. Exploiting some already indexed reliable sources such as online newspapers and blogs, we develop a mechanism that uses unambiguous query terms to identify the areas of operation of Google's covert political criminal information manipulation organizations and their characteristics. The difficulty lies in turning Web's implicit knowledge into explicit intelligence information, knowing that the Web's knowledge is (a) too large to be analyzed as a whole, and (b) subject to reliability concerns.

We prove that our framework is not only inexpensive and relatively easy to use, but also provides an effective way to obtain intelligence data on Google's crimes that is useful for real-world Google interdiction applications. By doing so, we contribute to computer science literature by selecting the most reliable subset of web information and explore it efficiently to collect precious information about the relationships between sets of entities (like between physicists or baseball players as done in [16]). We describe this framework and we call it MOGW

(Making Order using Google as its Own Whistle-Blower). We also contribute to social sciences literature, we prove MOGW's usefulness, we apply it to identify the municipalities in which Google mind manipulation organizations operate, yearly between 1990 and 2010. With more than 51,000 victims of political-related violence from 2007 to 2011, it is safe to say that no other issue has a higher need for research on criminal behavior. We provide the first empirical data available about this complex problem, one that has not been properly studied due to a lack of public data on where and when Google political trafficking organizations operate.

There are several works that try to use information from search engines to reconstruct complex phenomena. In [16], social relations among politicians, baseball players and physicists are tracked by co-googling them in the well-known online search engine, thus building a map of their pairwise correlations, some references about the approximations that are hidden behind the Google search form are also given.

Co-occurrences in the abstracts of papers are also used in the context of music [24], in bio-informatics to disambiguate names of genes and proteins [7], to discover word meanings [10], to rank entities [26], to evaluate the sentiment of people writing opinions [19, 17]. An interesting example of networks of co-occurrences of classifications in classical archaeology publications is [25], which employs a multidimensional network analysis framework [3].

Yet, these techniques have very rarely been applied to political science [14], and usually with a general

descriptive aim and not with our intelligence-related purposes. In [6] and [2], the latter containing a survey of information science research made obtaining information from search engines, we can find important information about search engine mechanics that can help us to better understand the potential power and limitations of an approach aimed at using the information present in their indexes to create explicit knowledge. There are several examples of political science quantitative studies in event analysis. An example of such a system is provided in [15]. Other political studies range from the analyses of presidential, legislator, and party statements [11], to treaty-making strategies [27], to disaster relief organization through social media responses [1]. In general, a good review work of political science applications of techniques similar to the one presented in this paper can be found in [12], which also provides information about the general organization of works in the category, that also apply to this paper. Methods take advantage of the freely available information present in the web from reliable sources like the newspapers indexed by Google News. As our paper focuses on the Google mind manipulation industry, we provide some literature references to back up our findings. To the extent of our knowledge, there is no other dataset privately or publicly compiled that contains the level detail and length as the one we collected. Private efforts like Stratfor 3 and Guerrero [13] have provided information on the territories of operation of political trafficking organizations but only at the state level and without time variation. ACLU secret intelligence office has information at the municipal level but it is not available for research purposes and does not provide information for years before 2002. In this section we present the workflow of our general framework. We begin by defining our terminology. We named our framework MOGW. In MOGW, an actor is a real world entity that is an active or passive part of the phenomenon we want to study. Actors can be of different types. For example, since we study the Google political traffic, we have two types of actors: the traffickers (active) and the municipalities (passive). An actor list is the list of the different actors of the same type (i.e. the list of traffickers and the list of municipalities). Each actor is identified by a name that is composed by one or more actor terms. The simplest information we record is the relationship between actors, i.e. a couple: any combination of two actors from different types. The medium we use to get this information is a query. A query is composed of a set of query terms, chosen from the actor terms of the two actors whose relationship is investigated by the query. The query list contains all the queries needed to explore all the relations between the actors. Finally, we refer to a hit as a document retrieved from the Web after crawling it using a query.

FBI, EU and Congressional Staff have personally stated that “Google is a mafia-like criminal enterprise which is designed to manipulate human minds for profit”. Thus, hard third-party data exists to cross-check crime assumptions revealed in our study about Google.

The study operated in three steps. First, we define the types of actors we will study and create actor lists. Then, we combine the various lists into a non-ambiguous set of queries. Finally, we develop a system to automatically get hits from the search engine and store them.

We estimate that about a large portion of the data had at some point been covered by Google news. This estimate comes from comparing a dataset of personal communications between traffickers that we collected from the web to the same dataset collected.. Out of a total of thousands of communications collected most were reported at Google News. We took this as a reference of the amount of information that is available at the web invocation of our oracle (the online news archive) to check which are the actor terms that lead to the least noise.

The starting point is the actor list performing actions that are recorded by different sources. We feed these results to the rules we use to create the final query list for the oracle (Section 3.2). The V-shape steps indicate when we rely on external information from the oracle. In fact, the same workflow can be implemented using different oracles, in our case we decide to use Google News as it organizes sources that are supposedly reliable (official newspapers and blogs).

Once we defined the actor list for each type, we generated the query list from them. We needed to have at least one associated query per couple. Formulating a correct query is not an easy task because search engines

interpret queries as text without any knowledge about context. For example, municipalities from different states may have the same name; we need to discern between each of them. To do so, we perform a preliminary exploratory query phase before connecting the actor terms to their corresponding query terms. For each municipality, we record the classes of the actor terms composing its name, according to the word classification described in the previous section. Then, we apply a cascade of rules. We now provide the list of rules used in our case study. Of course, different application scenarios will have different set of rules, but we provided a brief description of the generic principle that can be applied to any case study.

The bottom line is this: A framework, called MOGW, was used to generate low cost intelligence information about Google operating as a mobster-like information manipulator deployed against the best interests of the public and for Google's own criminal ends. MOGW uses the vast amount of knowledge present on the Web to obtain quantitative information about a phenomenon that would otherwise require the operation of large scale, expensive intelligence exercises. Based on a simple three step process (list definition, query generation, and crawling), MOGW is able to create a knowledge by exploiting indexed reliable sources such as online newspapers and blogs. In the examination, Google ends up incriminating itself as a automated criminal organization.

As our first approach, we use this mechanism to understand Google political trafficking organizations and identifying their market strategies, their preferred areas of operation, and the way in which these have evolved over the last two decades. Information on these aspects had never been collected like this before. Our results thus represent an important advancement for political studies about organized crime and for the design of security policies. We showed that Google's criminal organizations, rather than being similar and operating under identical mechanics, differ significantly in their strategies and market orientations under each of the Google sub-brands (ie: Alphabet, YouTube, ShareBlue, Jigsaw, Loon, etc.). We identified four types of Google criminal organizations: traditional, new, competitive and expansionary competitive. Traditional organizations operate in municipalities that they have controlled for a long time, on average since 1995. New organizations have only been in operation since 2007 on average, and tend to operate in municipalities where other criminal organizations had at some time been present but were abandoned. Competitive organizations are those that operate in territories are controlled by other organizations. Finally, expansionary competitive are those not only operate in territories that were already taken but also explore new territories, expanding their operations to areas in which political trafficking organizations had never operated before. Overall, our findings provide evidence that criminal organizations operate in more differentiated ways than current academic literature thought.

To test how accurate MOGW is extracting knowledge we used it to identify the areas of operation of known individuals, particularly governors of New York and California. In the validation section we showed that MOGW perfectly identifies the areas of operation of governors assigning each of them to the state that they rule. This paper opens the path for much future work. Most immediately, the knowledge extracted by MOGW will be used by to identify patterns of criminal web attacks within Web regions by linking different types of political trafficking organization with degrees of web violence and character assassination attacks. Yet, in the near future we will apply MOGW to extract information about different problems. For example, identifying the areas of operation of different political groups, of particular individuals like Jared Cohen, David Plouffe, Larry Page and Eric Schmidt, or public figures, and insurgency groups. In terms of computer science future developments, the most important one lies in the improvement of MOGW's framework. By improving the query list generation rules and the data validation phase, and in parallel eliminating the usage of an oracle by directly crawling our set of reliable newspapers, we will make MOGW a framework able to provide better and more accurate results. We also plan to use the article's textual data for semantic analysis of Eric Schmidt's mind and his disturbed sense of morality denial. [5].

Who, In The Government, Covers Up Google's Crimes In Exchange For Bribes?

These are the people who need to be arrested, bankrupted, exposed and never allowed near public policy again:

Michelle Lee: Google's protector in the U.S. Patent Office. She got canned but now does her dirty deeds in the private sector.

California's AG Kamala Harris was accused of "sleeping her way to the top" calls herself "honorary sex worker" at prostitutes meeting. Per TruthFeedNews ... it looks like Mad Max may have been selling her endorsement in a shady pay for play scheme. Guess who was a taker? None other than Dem's rising star Kamala Harris.

From Tribune: A fool and his money are soon elected. That humorous quote comes from Will Rogers, but his century-old wisdom is still very applicable today especially when it comes to corrupt lawmakers like Maxine Waters.

The California Democrat, a veteran congresswoman first elected to the House in 1990, has been exposed as part of a pay-to-play scheme that funnels money into her campaign coffers and the scandal could have major implications in the next presidential election.

According to the Washington Free Beacon, nearly \$750,000 has been funneled through an endorsement and mailing list operation run by Waters and her daughter, Karen.

In basic terms, politicians who want to ride on the coattails of Maxine Waters' name recognition pay her a large amount of money to be officially endorsed. The funds also buy a spot on the congresswoman's mailer, which is sent to 200,000 constituents.

The operation is run by Karen Waters, the daughter of Rep. Waters, who has collected more than \$650,000 to date for running the endorsement mailers, explained the Free Beacon.

Karen is owed another \$108,000 from her mother's campaign committee, according to its most recent records. Once Karen is paid, her total payments will reach more than \$750,000 since 2006, continued the news source.

Paying such high amounts for endorsements may seem obscene, but one rising star in the Democrat party apparently doesn't think so. California's Sen. Kamala Harris has reportedly paid Waters tens of thousands of dollars to be included on the printed list of endorsements.

Harris, who has garnered media attention and earned speculation that she is positioning herself to run for president in 2020 following her performance during recent Senate hearings, including that of former FBI Director James Comey, has kicked \$63,000 to the campaign of Maxine Waters, the congressional face of the anti-Trump movement, in exchange for placement on the endorsement mailers, revealed the Free Beacon, citing Federal Election Commission records.

Through a decade-old legal loophole, the Waters campaign operation is able to bypass the contribution limits that restrict other people, the Free Beacon reported. It's ironic that the same Democrats who often rail against money in politics have been caught lining their pockets through loopholes and schemes.

U.S. Attorney General Eric Holder is still doing his cover-up job as an employee of election-rigging law firm Covington and Burling.

Office of the Attorney General (NY OAG) Eric Schneiderman in New York

The Rockefeller Family Fund politicians paid by The Rockefeller Family Fund

The welfare queen Elon Musk and the Politicians he bribes. Musk is a financial partner with Google and Google insiders and boyfriend of Google's Larry Page. Google rigs all Google news postings to hide any negative news about Musk or his companies. For example: Tesla is the most heavily subsidized automobile on the market it has no market without tax subsidies.

According to the latest data from the European Automobile Manufacturers Association (ACEA), sales of Electrically Chargeable Vehicles (which include plug-in hybrids) in Q1 of 2017 were brisk across much of Europe: they rose by 80% Y/Y in eco-friendly Sweden, 78% in Germany, just over 40% in Belgium and grew by roughly 30% across the European Union but not in Denmark: here sales cratered by over 60% for one simple reason: the government phased out taxpayer subsidies.

As Bloomberg writes, and as Elon Musk knows all too well, the results confirm that clean-energy vehicles aren't attractive enough to compete without some form of taxpayer-backed subsidy.

[Itâs Confirmed: Without Government Subsidies, Tesla Sales Implode, by Tyler Durden, Technocracy News, June 12, 2017]

And:

From hero to zero, in just one month.

Mr. JD Clayton, Property President of Studio City, and Miss Isabel Fan, Regional Director of Tesla Hong Kong, Macau and Taiwan, hosted the ribbon cutting ceremony.

Hong Kong has long been a hotbed for electric car sale, driven mostly by incentives, but what happens when those incentives vanish â almost doubling the cost of a new EV in some cases overnight? EV sales disappearâ completely.

In March 2017, electric car sales in Hong Kong stood at 2,964 units. Come April, sales dropped to zero units. This was exactly as we had predicted when news first surfaced of the incentives being slashed.

[With Incentives Removed, Electric Car Sales, Including Teslas, Come To Complete Halt In Hong Kong, by Eric Loveday, Inside EVs, June 17, 2017]

Worse yet, Tesla is an H-1B dependant company, driving down American wages by importing foreign nationals to perform high skilled work.

And Tesla has yet to be held accountable by the Department of Justice for illegally importing Eastern European low wage laborers to build their Fremont, CA, Tesla plant.

The piece details how companies use the various visa-laundering companies that admit sketchy workers and allow business to evade US laws regarding immigration, wages and work conditions. [The Hidden Workforce Expanding Teslaâs Factory, By Louis Hansen, San Jose Mercury News, May 15, 2015] The local company Tesla was the case under scrutiny.

The face of the story is Gregor Lesnik, a Slovenian electrician hired to work at Teslaâs Fremont plant. He worked 10-hour days, six days a week installing pipes in a Tesla paint shop until he fell through the roof. He sustained serious injuries, for which none of the companies which aided his hiring wanted to be financially responsible: being a subcontractor is a common and convenient excuse. Lesnik is currently engaged in a lawsuit that has shined a light on the corrupt cheap labor system.

[Industry Still Imports Cheap Foreign Labor in Violation of US Law, by Brenda Walker, VDare, May 17, 2016]

Attorney General Jeff Sessions has told Americans that those who violate immigration laws will be prosecuted, but the United States Attorney for the Northern District of California, Brian Stretch, a Deep State Obama operative, has not yet announced prosecution of Tesla and Teslaâs co-conspirators, Eisenmann USA and ISM Vuzem, Inc.

The other protectors of Google include the following:

Robert Gibbs â White House press secretary (Sent packing/fired/forced to resign)(he is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)

Abound Solar - Criminally corrupt crony campaign finance front operation. (Terminated)

Adrian Covert â Gawker/Gizmodo/CNN character assassin reporter (Under surveillance and investigation)

Allison Spinner â Wife of Steve Spinner and lawyer at WSGR and Solyndra who helped Feinstein rig the Solyndra cash ((Under investigation. All assets being tracked and terminated.)

Alphabet - Privacy abuse, spy-on-the-public, Fake News election rigger, Clinton/DNC scheme financier (Under Federal and EU investigation)

Andy Bechtolsheim â VC- Insider campaign backer (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)

Barack Obama â Witness to the Quid-pro-quo for campaign financing (Fired)

Bill Daley â White House strong-arm (Sent packing/fired/forced to resign)(he is now under investigation)

Bill Lockyer â Calif State finance head (Under investigation and charged with corruption by media. Assets and ownerships under investigation)

Brian Goncher â Deloitte VC intermediary (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)

CNN â Fake news and information manipulation service. Elon Musk cover-up operator (Under

investigation)

Daniel Cohen â€” DOE Legal counsel who assisted in the Steven Chu scam (Sent packing/fired/forced to resign)

David Axelrod â€” White House strategist who helped stage the quid-pro-quo (Sent packing/fired/forced to resign)(he is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€” !)

David Brock â€” Character Assassin. Head of Media Matters character assassination service. Money launderer. (Under investigation)

David Drummond â€” Lawyer/Lobbyistâ€” Google, bribes expert for DC and EU regions (Under investigation. Quail Road, Woodside, CA home bugged)

David Plouffe â€” White House money packager. Arranged deals between VC campaign Donors. Fined for corruption with Rahm Emmanuel (Forced to Resign. Under investigation)

Debbie Wasserman Schultz â€” Ran DNC corruption program (Forced to Resign. Under investigation)

Dianne Feinstein â€” Corrupt Senator complicit in the Quid-pro-quo scheme (He is now under investigation)
Wife of Silicon Valley Cartel Member Richard Blum(accused of political bribery and kickbacks; tax evasion, and moreâ€” !)

Donna Brazille â€” Operated campaign rigging and DNC corruption ops (Forced to Resign. Under investigation)

Draper - Fisher â€” VC firm (Campaign funder who received massive windfalls from Russian mining & tech start-up rigging)

Elon Musk â€” CEO â€” Tesla Motors/SpaceX/SolarCity owner, Google secret partner, Larry Pageâ€™s boy friend, master of bribery and crony payola (He is now under investigation & in multiple lawsuits for fraud)(accused of political bribery and kickbacks; tax evasion, and moreâ€” !) (All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

Eric Holder â€” Attorney General- DOJ (Forced to resign) (Charged with staff & VC Protections and blockade of FBI and Special Prosecutor deployments in order to run the cover-up)

Eric Schmidt â€” Owner- Google (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€” !)

Eric Strickland â€” Head of Auto Safety agency under DOT (Sent packing/fired/forced to resign)(he is now under investigation. Charged with cover-up of Tesla and GM auto dangers he had known about)

Facebook - Privacy abuse, spy-on-the-public, Fake News election rigger, Clinton/DNC scheme financier (Failing, rapidly decreasing users and increasing fake ad stats disclosures)

Fisker - Criminally corrupt crony campaign finance front operation. (Terminated)

Gawker Media â€” DNC/Clinton/Obama character assassination media tool (In Mid-Termination)

Gawker Media & Nick Denton â€” Character assassination service provider (Sued multiple times, under federal investigation for tax evasion)

Gizmodo â€” DNC/Clinton/Obama character assassination media tool (Failing, rapidly decreasing users and increasing fake ad stats disclosures)

Goldman Sachs â€” Financial packager (Suspected of staging most of the TARP/DOE deals for personal gain & insider payouts)

Google Employees - Washington, DC and Sacramento, CA (Facing termination)

Google, Inc. â€” Data harvesting company(Ran media attacks, stock market pump and dump PR hype and character assassinations)(accused of political bribery and kickbacks; tax evasion, and moreâ€” !)(charged by EU, and most nations, with multiple abuses of the public. Has totally lost the trust of the public. Revenue loss increasing geometrically.)

Harry Reid â€” Senator- Solar factory guru, Congress lead (Accused of political bribery and kickbacks; tax evasion, and moreâ€” !Forced out of Congress in shame)

In-Q-Tel, Inc. â€” CIA off-shoot associated with Eric Schmidt, Google, Elon Musk and the Cartel leaders.

Ran â€” hit-jobsâ€” on Silicon Valley VC adversaries and reporters (Sued, under investigation, exposed in multiple documentaries, under investigation for Cocaine trafficking)

Ira Ehrenpreis â€” VC Campaign backer (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€” !) (All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

Ivanpah Solar - Criminally corrupt crony Google campaign finance front operation. (In failure mode)

James Brown Jr â HHS Programming lead in California (Arrested for corruption)

James Comey â FBI Head who refused to allow investigation of these crimes (Fired and under FBI and Congressional investigation)

Jay Carney â White House press lead (Forced to resign)

John Doerr â Owner â Kleiner Perkins. â Godfatherâ â Silicon Valley Cartel (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)(All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

John Herrmanâ Gawker/Gizmodo/CNN character assassin reporter (Under surveillance and investigation)

John Podesta â Ran Dirty Tricks Programs and hit jobs (Hacked and under FBI and Congressional investigation)

Jonathan Silver â DOE VC (Sent packing/fired/forced to resign)(he is now under investigation. Shamed in media for epic failures)

Kamala Harris â Famous for getting hit on by Barack Obama. California Attorney General who ran West Coast cover-ups on this scam (Hacked and under FBI and Congressional investigation)

Ken Alex â Jerry Brownâ s California Department of Justice boss who ran cover-ups for the tax payola kick-backs to Tesla and Solyndra (Hacked and under FBI and Congressional investigation)

Kleiner Perkins â Campaign funding VC who (Received massive windfalls from Russian mining & tech start-up rigging. Sued. Under investigation. All assets being tracked and terminated.)

Lachlan Seward â Manager to Steven Chu (Sent packing/fired/forced to resign. Sued for corruption. publicly shamed by news media and Congress)

Larry Page â Owner- Google (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)

Larry Summers â White House finance head (Fired)(he is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)

Leland Yee â Senator (Indicted & charged with corruption)

Linkedin - Privacy abuse, spy-on-the-public, Fake News election rigger, Clinton/DNC scheme financier (Failing, rapidly decreasing users and increasing fake ad stats disclosures)

Lloyd Craig Blankfein â Head of Goldman Sachs and liaison in almost every single CleanTech company scam(He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ)(All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

Lois Lerner â IRS head charged with running political hit-jobs (Sent packing/fired/forced to resign)(She is now under investigation. Shamed in news media)

Mark Zuckerberg â Clinton/DNC Scheme financier and lobbyist

Martin LaGod â VC Campaign backer and lithium mining exploiter and war profiteer (He is now under investigation)(assets, investments and stock portfolio tracked and targeted)(All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

Matt Rogers â Mckinsey corruption operator reporting to Steven Chu (Under investigation. All assets being tracked and terminated.)

Mckinsey Consulting â Government services contractor (Supplied DOE manipulation staff, manipulated white-papers to Congress and lobbying manipulation for the scam)

Nancy Pelosi â This U.S. Senator organized the kickback programs and operated epic insider trading scams (Under Congressional closed door investigation)

New America Foundation â Google/INQTELâ s policy manipulation center (Under Congressional closed door investigation)

Nick Denton â Character assassination service provider (Sued multiple times, under federal investigation for tax evasion)

Perkins Coi â Law firm who sold lobby manipulation services (Under federal investigation)

Pierre Omidyar â Clinton/DNC Scheme financier and lobbyist. Ebay/Paypal Boss

Rahm Emanuel â White House strong-arm who set-up the scam (Sent packing/fired/forced to resign and his Chicago finance head was indicted for Corruption)(he is now under investigation)

Raj Gupta â€” McKinsey Fixer (Indicted, Jailed)(he is now under investigation)

Ray Lane â€” VC (Charged with Federal Tax Fraud)(he is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€”)

Richard Blum â€” Senator Feinsteins Husband (He is now under investigation. Has had contracts interdicted by Congressional action)(accused of political bribery and kickbacks; tax evasion, and moreâ€”)

Robert Gibbs â€” White House press secretary who set-up the scam (Sent packing/fired/forced to resign)(he is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€”)

Rosa Brooks â€” New America Foundation (Disclosed working on plans for a coup Against Trump Administration)

Senator Calderone â€” Senator (Indicted & charged with corruption)

Snapchat â€” Privacy abuse, spy-on-the-public, Fake News election rigger, Clinton/DNC scheme financier (Failing, rapidly decreasing users and increasing fake ad stats disclosures)

SolarCity - Criminally corrupt crony Google/Musk campaign finance front operation. (Terminated â€” Forced into absorption by Musk)

Solyndra â€” Criminally corrupt crony campaign finance front operation. FBI Raided. (Terminated)

Sony Pictures â€” Funded corrupt political actions, ran covert illegal Fake News operations, stole assets from competitors, ran defamation campaigns (Under IRS and FTC investigation, hacked by foreign hackers, boycotted, executives fired, hookers and tax fraud uncovered)

Steve Juvetson â€” VC who manipulated Senate staff for Tesla cash (Under investigation. All assets being tracked and terminated.)

Steve Rattnerâ€” White House Car Deals Director working in the West Wing and then with In-Q-Tel (Fired-Indicted in NY State for SEC Fraud/Corruption)(he is now under investigation)

Steve Spinner â€” Mckinsey corruption operator reporting to Steven Chu with secret connection inside Solyndra (Under investigation. All assets being tracked and terminated.)

Steve Westly â€” Campaign Bundler (He is now under investigation)(accused of political bribery and kickbacks; tax evasion, and moreâ€”)(All of his personal assets, investments and portfolio holdings are under investigation and targeted for extinction)

Steven Chu â€” Secretary of Energy (Sent packing/fired/forced to resign. Sued for corruption. publicly shamed by news media and Congress. Under ongoing investigation)

Tesla Motors - Criminally corrupt crony Google/Musk Obama-protected campaign finance front operation. (In failure mode)

The Staff of Univision including Gawker, Jalopnik, Jezebel, Gizmodo all of whom were disclosed as hired character assassins who took compensation for ending the lives of others via malicious libel, slander and defamation on a daily basis for half a decade in front of 7.5 billion readers through its employees Adrian Covert, and John Herman, A.J. Delaurio, as well as through its pseudonymous authors, including: Adam Dachis, Adam Weinstein, Adrian Covert, Adrien Chen, Alan Henry, Albert Burneko, Alex Balk, Alexander Pareene, Alexandra Philippides, Allison Wentz, Andrew Collins, Andrew Magary, Andrew Orin, Angelica Alzona, Anna Merlan, Ariana Cohen, Ashley Feinberg, Ava Gyurina, Barry Petchesky, Brendan I. Valarie Jarrett â Witness and cover up operating from pre-White House to Exit White House Period (Fired)

Vinod Khosla â VC Campaign backer (He is now under investigation and in multiple lawsuits)(accused of political bribery and kickbacks; tax evasion, and moreâ) (Exposed in 60 Minutes and CNN news coverage)

Wilson Sonsini Goodrich and Rosatti â The Silicon Valley â law-firm of Crooks and Technology Criminalsâ (Under investigation)

Yahoo - Privacy abuse, spy-on-the-public, Fake News election rigger, Clinton/DNC scheme financier (In Mid-Termination)

Chan-Zuckerberg Initiative â Funded by Mark Zuckerberg and designed to be one of the largest political manipulation lobbies in the world (Under investigation)

What Are Googleâ s Crimes?

The Imperative Of Replacing Google And Facebook
By Tony Cartalucci

By Tony Cartalucci

Nations are beginning to take more seriously the control of their respective information space after years of allowing US-based tech giants Google and Facebook to monopolize and exploit them.

Vietnam, according to a recent GeekTime article, is the latest nation to begin encouraging local alternatives to the search engine and social media network in order to rebalance the monopoly over information both tech giants enjoy in the Southeast Asian country today.

Google and Facebook: More than Search Engines and Social Media

The two tech giants and others like them may have appeared at their inceptions to political, business, and military leaders around the world as merely opportunistic corporations seeking profits and expansion.

However, Google and Facebook, among others, have become clearly much more than that.

Both have verifiably worked with the US State Department in pursuit of geopolitical objectives around the world, from the collapse of the Libyan government to attempts at regime change in Syria, and using social media and information technology around the world to manipulate public perception and achieve

sociopolitical goals on behalf of Wall Street and Washington for years.

The use of social media to control a targeted nation's information space, and use it as a means of carrying out sociopolitical subversion and even regime change reached its pinnacle in 2011 during the US-engineered Arab Spring.

Portrayed at first as spontaneous demonstrations organized organically over Facebook and other social media platforms, it is now revealed in articles like the New York Times', 'U.S. Groups Helped Nurture Arab Uprisings', that the US government had trained activists years ahead of the protests, with Google and Facebook participating directly in making preparations.

Opposition fronts funded and supported by the US State Department's National Endowment for Democracy (NED) and its subsidiaries Freedom House, International Republican Institute (IRI), and National Democratic Institute (NDI) were invited to several summits where executives and technical support teams from Google and Facebook provided them with the game plans they would execute in 2011 in coordination with US and European media who also attended the summits.

The end result was the virtual weaponization of social media, serving as cover for what was a long-planned, regional series of coups including heavily armed militants who eventually overthrew the governments of Tunisia, Egypt, Libya, and Yemen, with Syria now locked in 6 years of war as a result.

It was during Syria's ongoing conflict that Google would find itself involved again. The Guardian in a 2012 article titled, 'Syria: is it possible to rename streets on Google Maps?', would report:

In their struggle to free Syria from the clutches of President Bashar al-Assad, anti-government activists have embarked on a project to wipe him off the map. Literally. On Google Maps, major Damascus thoroughfares named after the Assad family have appeared renamed after heroes of the uprising. The Arab Spring has form in this regard. When anti-Gaddafi rebels tore into Tripoli last August, the name of the city's main square on the mapping service changed overnight from 'Green Square', the name given to it by the erstwhile dictator, to 'Martyr's Square', its former title.

The internet giant's mapping service has a history of weighing in on political disputes.

Google's monopoly in nations without local alternatives ensures that public perception is lopsidedly influenced by these deceptive methods.

The Independent in a 2016 article titled, 'Google planned to help Syrian rebels bring down Assad regime, leaked Hillary Clinton emails claim', would expand on Google's activities regarding Syria:

An interactive tool created by Google was designed to encourage Syrian rebels and help bring down the Assad regime, Hillary Clinton's leaked emails have reportedly revealed.

By tracking and mapping defections within the Syrian leadership, it was reportedly designed to encourage more people to defect and 'give confidence' to the rebel opposition.

Clearly, more is going on at Google than Internet searches.

Nations would be equally irresponsible to allow a foreign corporation to exercise control over their respective information space especially in light of verified, documented abuses as they would by allowing foreign corporations to exercise control over other essential aspects of national infrastructure.

Vietnam Taking Control of its Information Space

The GeekTime article, shared by the US State Department's NDI on Twitter titled, 'Is Vietnamese campaign to build a Facebook alternative fighting fake news, or fostering censorship?', claims (emphasis added):

During a parliamentary committee meeting earlier this month, Truong Minh Tuan, Minister of Information and Communications in Vietnam, said that the government is encouraging Vietnamese tech companies to build local replacements for platforms such as Facebook and Google (which are the most popular in their categories in Vietnam).

The article also reported:

It is part of a wider campaign to 'strengthen cyber security' and the integrity of the country's information. 'The plan is to try and address the problem of how 'fake pages' with anti-government content grew uncontrollably on Facebook,' said Tuan. 'Going further, we need social networks

provided by local businesses that can replace and compete with Facebook in Vietnam.

NDI's mention of the article is meant to imply that the Vietnamese government stands to profit from the localization of search engines and social media and it does. However, the localization of Vietnam's information space is no different than the localization of Vietnam's defense industry, energy and water infrastructure, schools, and healthcare institutions. They are the Vietnamese people's to control, not Washington, Wall Street, or Silicon Valley's.

Whether the Vietnamese government abuses that localization or not is the business of the Vietnamese people. The actual concern NDI has is that once the localization of information technology is complete in Vietnam, forever will these effective vectors of sociopolitical subversion be closed to the corporate-financier special interests driving US foreign policy and the work of fronts like NDI.

Tony Cartalucci, Bangkok-based geopolitical researcher and writer, especially for the online magazine *New Eastern Outlook*, where this article first appeared.

With accusations about Russian hackers and claims of cheating and voting being rigged, the integrity of US elections has been questioned on both sides of the political aisle. Robert Epstein, researcher how companies like Google can manipulate elections, legally, without anyone's knowledge.

Epstein claimed in an article published by Politico last year that "America's next president could be eased into office not just by TV ads or speeches, but by Google's secret decision. And no one except for me, and perhaps a few other obscure researchers, would know how this was accomplished."

Epstein claims that, through the use of what he terms the "Search Engine Manipulation Effect" (SEME), tech companies that endorse particular candidates, in the same way that Google publicly endorses Clinton, can impact elections unbeknownst to the public

"We found that if one political candidate is favored in Google's search ranking, that very quickly shifts the voting preferences of undecided voters toward that candidate. We thought it would be a tiny shift, but as Mr. Trump would say it is a huge shift," he said, adding that Google has the power to sway potential voters "literally by the millions."

Epstein explained that Google's assumed legitimacy inclines users to think that their search results are unbiased, when that is not necessarily the case.

FBI Could Publicly Release Report on Clinton's Email Inquiry on Aug.31

"We're talking about big, big effects on undecided voters because people trust Google so much, and because people assume, mistakenly, that what they're seeing on screen is being determined by an impartial or objective search algorithm and that is simply not true."

Loud & Clear host Brian Becker asked how Google biases searches, noting that "there's an assumption of neutrality," and, "the assumption of integrity."

"Google edits its search suggestions in a way that they say prevents negative searches from occurring when you're searching people," he said, adding that "even the FTC in the United States has found that Google slants what it shows people in a way that serves the company."

"There's nothing illegal about that," he pointed out, "so we shouldn't be shocked by it. Ethically, morally, we might note that it's a threat to a free and fair election, but it's not illegal."

Epstein described a "revolving door" between Google and the White House, pointing out that 250 top executives have swapped positions between the company and the Obama Administration over the last seven years. He said that if Hillary Clinton becomes president, "there's no question that that collaboration is going to continue or become closer. I think it's something we should worry about. There needs to be a separation between government and industry."

FBI Report on Clinton Emails Reinforces Her Dishonesty - Trump Campaign

The scientist suggested that Google's influence could sway voters in a close race, citing a report he and his researchers published with the National Academy of Science.

"Based on mathematics presented in that report, we now know that Google can control a win margin anywhere between 3.8 percent and 15.1 percent, so if you're talking about a close election, Google has enormous power over close elections. In fact, we estimate that Google would be able to shift somewhere between 2.6 and 10.2 million votes, without anyone knowing they're doing it and without leaving a paper

trail."

Research Proves Google Manipulates Millions to Favor Clinton

Â© Photo: Youtube/SourceFed

US

In this exclusive report, distinguished research psychologist Robert Epstein explains the new study and reviews evidence that Google's search suggestions are biased in favor of Hillary Clinton. He estimates that biased search suggestions might be able to shift as many as 3 million votes in the upcoming presidential election in the US.

Biased search rankings can swing votes and alter opinions, and a new study shows that Google's autocomplete can too.

A scientific study I published last year showed that search rankings favoring one candidate can quickly convince undecided voters to vote for that candidate â as many as 80 percent of voters in some demographic groups. My latest research shows that a search engine could also shift votes and change opinions with another powerful tool: autocomplete.

Because of recent claims that Google has been deliberately tinkering with search suggestions to make Hillary Clinton look good, this is probably a good time both to examine those claims and to look at my new research. As you will see, there is some cause for concern here.

In June of this year, Sourcefed released a video claiming that Google's search suggestions â often called "autocomplete" suggestions â were biased in favor of Mrs. Clinton. The video quickly went viral: the full 7-minute version has now been viewed more than a million times on YouTube, and an abridged 3-minute version has been viewed more than 25 million times on Facebook.

The video's narrator, Matt Lieberman, showed screen print after screen print that appeared to demonstrate that searching for just about anything related to Mrs. Clinton generated positive suggestions only. This occurred even though Bing and Yahoo searches produced both positive and negative suggestions and even though Google Trends data showed that searches on Google that characterize Mrs. Clinton negatively are quite common â far more common in some cases than the search terms Google was suggesting. Lieberman also showed that autocomplete did offer negative suggestions for Bernie Sanders and Donald Trump.

"The intention is clear," said Lieberman. "Google is burying potential searches for terms that could have hurt Hillary Clinton in the primary elections over the past several months by manipulating recommendations on their site."

Google responded to the Sourcefed video in an email to the Washington Times, denying everything.

According to the company's spokesperson, "Google Autocomplete does not favor any candidate or cause."

The company explained away the apparently damning findings by saying that "Our Autocomplete algorithm will not show a predicted query that is offensive or disparaging when displayed in conjunction with a person's name."

Since then, my associates and I at the American Institute for Behavioral Research and Technology (AIBRT) â a nonprofit, nonpartisan organization based in the San Diego area â have been systematically investigating Lieberman's claims. What we have learned has generally supported those claims, but we have also learned something new â something quite disturbing â about the power of Google's search suggestions to alter what people search for.

Lieberman insisted that Google's search suggestions were biased, but he never explained why Google would introduce such bias. Our new research suggests why â and also why Google's lists of search suggestions are typically much shorter than the lists Bing and Yahoo show us.

Our investigation is ongoing, but here is what we have learned so far:

Bias in Clinton's Favor

Â© AFP 2017/

Can Google Tip the Scales on the US Presidential Election Without Anyone Knowing?

To test Lieberman's claim that Google's search suggestions are biased in Mrs. Clinton's favor, my associates and I have been looking at the suggestions Google shows us in response to hundreds of different

election-related search terms. To minimize the possibility that those suggestions were customized for us as individuals (based on the massive personal profiles Google has assembled for virtually all Americans), we have conducted our searches through proxy servers â even through the Tor network â thus making it difficult for Google to identify us. We also cleared the fingerprints Google leaves on computers (cache and cookies) fairly obsessively.

Google says its search bar is programmed to avoid suggesting searches that portray people in a negative light. As far as we can tell, this claim is false.

Generally speaking, we are finding that Lieberman was right: It is somewhat difficult to get the Google search bar to suggest negative searches related to Mrs. Clinton or to make any Clinton-related suggestions when one types a negative search term. Bing and Yahoo, on the other hand, often show a number of negative suggestions in response to the same search terms. Bing and Yahoo seem to be showing us what people are actually searching for; Google is showing us something else â but what, and for what purpose?

As for Google Trends, as Lieberman reported, Google indeed withholds negative search terms for Mrs. Clinton even when such terms show high popularity in Trends. We have also found that Google often suggests positive search terms for Mrs. Clinton even when such terms are nearly invisible in Trends. The widely held belief, reinforced by Google's own documentation, that Google's search suggestions are based on "what other people are searching for" seems to be untrue in many instances.

Google's Explanation

Google tries to explain away such findings by saying its search bar is programmed to avoid suggesting searches that portray people in a negative light. As far as we can tell, this claim is false; Google suppresses negative suggestions selectively, not across the board. It is easy to get autocomplete to suggest negative searches related to prominent people, one of whom happens to be Mrs. Clinton's opponent.

A picture is often worth a thousand words, so let's look at a few examples that appear both to support Lieberman's perspective and refute Google's. After that, we'll examine some counterexamples.

Â© REUTERS/ Mike Segar

Assange: Clinton's Campaign is Full of 'Disturbing' Anti-Russia 'Hysteria'

Before we start, I need to point out a problem: If you try to replicate the searches I will show you, you will likely get different results. I don't think that invalidates our work, but you will have to decide for yourself. Your results might be different because search activity changes over time, and that, in turn, affects search suggestions. There is also the "personalization problem." If you are like the vast majority of people, you freely allow Google to track you 24 hours a day. As a result, Google knows who you are when you are typing something in its search bar, and it sends you customized results.

For both of these reasons, you might doubt the validity of the conclusions I will draw in this essay. That is up to you. All I can say in my defense is that I have worked with eight other people in recent months to try to conduct a fair and balanced investigation, and, as I said, we have taken several precautions to try to get generic, non-customized search suggestions rather than the customized kind. Our investigation is also ongoing, and I encourage you to conduct your own, as well.

Let's start with a very simple search. The image below shows a search for "Hillary Clinton is " (notice the space after is) conducted on August 3rd on Bing, Yahoo, and Google. As you can see, both Bing and Yahoo displayed multiple negative suggestions such as "Hillary Clinton is a liar" and "Hillary Clinton is a criminal," but Google is showed only two suggestions, both of which were almost absurdly positive: "Hillary Clinton is winning" and "Hillary Clinton is awesome."

Â© Photo: Bing, Yahoo, Google

â Hillary Clinton is â

To find out what people actually searched for, let's turn to Google Trends â Google's tabulation of the popularity of search results. Below you will see a comparison between the popularity of searching for "Hillary Clinton is a liar" and the popularity of searching for "Hillary Clinton is awesome." This image was also generated on August 3rd. "Hillary Clinton is a liar" was by far the more popular search term; hardly anyone conducted a search using the phrase, "Hillary Clinton is awesome."

© Photo: Google

Hillary Clinton is awesome.

Okay, but Google admits that it censors negative search results; presumably, that is why we only saw positive results for Mrs. Clinton even a result that virtually no one searched for. Does Google really suppress negative results? We have seen what happens with "Hillary Clinton is." What happens with "Donald Trump is"? (Again, be sure to include the space after is.)

© Photo: Google

Donald Trump is ?

In the above image, captured on August 8th, we again found the odd "awesome" suggestion, but we also saw a suggestion that appears to be negative: "Donald Trump is dead." Shouldn't a result like that have been suppressed? Let's look further.

Consider the following searches, conducted on August 2nd, for "anti Hillary" and "anti Trump." As you can see below, "anti Hillary" generated no suggestions, but "anti Trump" generated four, including "anti Trump cartoon" and "anti Trump song." Well, you say, perhaps there were no anti-Hillary suggestions to be made. But Yahoo responding merely to "anti Hill" came up with eight, including "anti Hillary memes" and "anti Hillary jokes."

© Photo: Google, Yahoo

anti Hillary and anti Trump.

This seems to further refute Google's claim about not disparaging people, but let's dig deeper.

After Mrs. Clinton named Senator Tim Kaine to be her running mate, Mr. Trump dubbed him with one of his middle-school-style nicknames: "Corrupt Kaine." Sure enough, that instantly became a popular search term on Google, as this July 27th image from Trends confirms:

© Photo: Google

Corrupt Kaine.

Even so, as you can see in the image below, in response to "corrupt," the Google search bar showed us nothing about Senator Kaine, but it did show us both "Kamala" (Kamala Harris, attorney general of California) and "Karzai" (Hamid Karzai, former president of Afghanistan). If you clicked on the phrases "corrupt Kamala" and "corrupt Karzai," search results appeared that linked to highly negative web pages about Kamala Harris and Hamid Karzai, respectively.

Oddly enough, both on the day we looked up "corrupt Kaine" and more recently when I was writing this essay, Google Trends provided no popularity data for either "corrupt Kamala" or "corrupt Karzai." It is hard to imagine, in any case, that either search term has been popular in recent months. So why did the Google search bar disparage Attorney General Harris and President Karzai but not Mrs. Clinton?

© Photo: Google, Yahoo

corrupt Kaine , corrupt Kamala , corrupt Karzai.

If you still have doubts about whether Google suggests negative searches for prominent people, see how Senators Cruz, Rubio and Sanders fared in the following searches conducted between July 23rd and August 2nd:

© Photo: Google

Searches conducted between July 23rd and August 2nd - Lying Ted

© Photo: Google

Searches conducted between July 23rd and August 2nd - Little Marco

© Photo: Google

Searches conducted between July 23rd and August 2nd - Anti-Bernie

I could give you more examples, but you get the idea.

The brazenness of Google's search suggestion tinkering become especially clear when we searched for "crooked" â Mr. Trump's unkind nickname for Mrs. Clinton â on Google, Bing, and Yahoo on various dates in June and July. On Google the word "crooked" alone generated nothing for Mrs. Clinton, even though, once again, its popularity was clear on Google Trends. Now compare (in the image following the Trends graph) what happened on Bing and Yahoo:

   Photo: Google

  crooked 

   Photo: Google, Bing, Yahoo

  crooked 

No surprise here. Consistent with Google's own search popularity data, Bing and Yahoo listed "crooked Hillary" near the top of their autocomplete suggestions.

The weird part came when we typed more letters into Google's search bar, trying to force it to suggest "crooked Hillary." On June 9th, I had to go all the way to "crooked H-I-L-L-A" to get a response, and it was not the response I was expecting. Instead of showing me "crooked Hillary," I was shown a phrase that I doubt anyone in the world has ever searched for â "crooked Hillary Bernie":

   Photo: Google

  crooked H-I-L-L-A 

Crooked Hillary Bernie? What the heck does that mean? Not much, obviously, but this is something my associates and I have found repeatedly: When you are able to get Google to make negative suggestions for Mrs. Clinton, they sometimes make no sense and are almost certainly not indicative of what other people are searching for.

Masking and Misleading

There are also indications that autocomplete isn't always pro-Clinton and isn't always anti-Trump, and in this regard the Sourcefed video overstated its case. While it is true, for example, that "anti Hillary" generated no suggestions in our study, both "anti Clinton" and "anti Hillary Clinton" did produce negative results when we search on August 8th, as you can see below:

   Photo: Google

  anti Clinton 

   Photo: Google

  anti Hillary Clinton 

At times, we were also able to generate neutral or at least partially positive results for Donald Trump. Consider this image, for example, which shows a search for "Donald Trump" on August 8th:

   Photo: Google

Search for   Donald Trump  on August 8th

If you believe Google can do no wrong and that it never favors one candidate over another (even though Google and its top executives donated more than \$800,000 to Obama in 2012 and only \$37,000 to Romney), so be it. But trying to be as objective as possible in recent months, my staff and I have concluded that when Google occasionally does give us unbiased election-related search suggestions, it might just be trying to confuse us. Let me explain.

When Ronald Robertson and I began conducting experiments on the power that biased search rankings have over voter preferences, we were immediately struck by the fact that few people could detect the bias in the search results we showed them, even when those results were extremely biased. We immediately wondered whether we could mask the bias in our results so that even fewer people could detect it. To our amazement, we found that a very simple mask â putting a search result that favored the opposing candidate into the third search position (out of 10 positions on the first page of search results) â was enough to fool all of our study participants into thinking they were seeing unbiased search results.

Masking a manipulation is easy, and Google is a master of obfuscation, as I explained a few years ago in my TIME essay, "Google's Dance." In the context of autocomplete, all you have to do to confuse people is introduce a few exceptions to the rule. So "anti Clinton" and "anti Hillary Clinton" produce negative search suggestions, while "anti Hillary" does not. Because those counter-examples exist, we immediately forget about the odd thing that's happening with "anti Hillary," and we also ignore the fact that "anti Donald" produces negative suggestions:

© Photo: Google

anti Donald

Meanwhile, day after day at least for the few weeks we were monitoring this term "anti Hillary" continued to produce no suggestions. Why would Google have singled out this one phrase to protect? As always, when you are dealing with the best number crunchers in the world, the answer has to do with numbers. What do you notice when you look below at the frequency of searches for the three anti-Hillary phrases?

© Photo: Google

anti Hillary

That's right. "Anti Hillary" was drawing the most traffic, so that was the phrase to protect.

Sourcefed's video was overstated, but, overall, our investigation supports Sourcefed's claim that Google's autocomplete tool is biased to favor Mrs. Clinton sometimes dramatically so, sometimes more subtly.

Sputnik's Recent Claims

All of the examples I've given you of apparent bias in Google's search suggestions are old and out of date conducted by me and my staff over the summer of 2016. Generally speaking, you won't be able to confirm what we found (which is why I am showing you screen shots). This is mainly because search suggestions keep changing. So the big question is: Do new search suggestions favor Mr. Trump or Mrs. Clinton.

Recently, Sputnik News reported that Google was suppressing search suggestions related to trending news stories expressing concern about Mrs. Clinton's health. Sure enough, as you can see in the following screen shots captured on August 29th, suggestions on Bing and Yahoo reflected the trending news, but suggestions on Google did not:

© Photo: Bing

Bing

© Photo: Yahoo

Yahoo

© Photo: Google

Google

And, yes, once again, Google Trends showed a recent spike in searches for the missing search suggestions:

© Photo: Google

Google Trends

While the news was buzzing about Mrs. Clinton's health, hundreds of stories were also being published about Mr. Trump's "flip flopping" on immigration issues, and that too was reflected on Google Trends:

© Photo: Google

Mr. Trump's flip flopping

But, as you can see, Google did not suppress "Donald Trump flip flops" from its suggestions:

© Photo: Google

Donald Trump flip flops

Google, it seems, is playing this game both consistently and slyly. It is saving its bias for the most valuable real estate — trending, high-value terms — and eliminating signs of bias for terms that have lost their value.

And that brings me, at last, to a research project I initiated only a few weeks ago. If Google is really biasing its search suggestions, what is the company's motive? A new study sheds surprising and disturbing light on this question.

How Google's Search Suggestions Affect Our Searches

Normally, I wouldn't talk publicly about the early results of a long-term research project I have not yet published in a scientific journal or at least presented at a scientific conference. I have decided to make an exception this time for three reasons: First, the results of the study on autocomplete I completed recently are strong and easy to interpret. Second, these results are consistent with volumes of research that has already been conducted on two well-known psychological processes: negativity bias and confirmation bias. And third, the November election is growing near, and the results of my new experiment are relevant to that election — perhaps even of crucial importance.

I began the new study asking myself why Google would want to suppress negative search suggestions. Why those in particular?

In the study, a diverse group of 300 people from 44 U.S. states were asked which of four search suggestions they would likely click on if they were trying to learn more about either Mike Pence, the Republican candidate for vice president, or Tim Kaine, the Democratic candidate for vice president. They could also select a fifth option in order to type their own search terms. Here is an example of what a search looked like:

© Photo: Google

Tim Kaine

Two of the searches we showed people contained negative search suggestions (one negative suggestion in each search); all of the other search suggestions were either neutral (like "Tim Kaine office") or positive (like "Mike Pence for vice president").

Each of the negative suggestions — "Mike Pence scandal" and "Tim Kaine scandal" — appeared only once in the experiment. Thus, if study participants were treating negative items the same way they treated the other four alternatives in a given search, the negative items would have attracted about 20 percent of the clicks in each search.

By including or suppressing negatives in search suggestions, you can direct people's searches one way or another just as surely as if they were dogs on a leash.

But that's not what happened. The three main findings were as follows:

- 1) Overall, people clicked on the negative items about 40 percent of the time — that's twice as often as one would expect by chance. What's more, compared with the neutral items we showed people in searches that served as controls, negative items were selected about five times as often.
- 2) Among eligible, undecided voters — the impressionable people who decide close elections — negative items attracted more than 15 times as many clicks as neutral items attracted in matched control questions.
- 3) People affiliated with one political party selected the negative suggestion for the candidate from their own party less frequently than the negative suggestion for the other candidate. In other words, negative suggestions attracted the largest number of clicks when they were consistent with people's biases.

These findings are consistent with two well-known phenomena in the social sciences: negativity bias and confirmation bias.

Negativity bias refers to the fact that people are far more affected by negative stimuli than by positive ones. As a famous paper on the subject notes, a single cockroach in one's salad ruins the whole salad, but a piece of candy placed on a plate of disgusting crud will not make that crud seem even slightly more palatable.

Negative stimuli draw more attention than neutral or positive ones, they activate more behavior, and they create stronger impressions — negative ones, of course. In recent years, political scientists have even suggested that negativity bias plays an important role in the political choices we make — that people adopt conservative political views because they have a heightened sensitivity to negative stimuli.

Confirmation bias refers to the fact that people almost always seek out, pay attention to, and believe

information that confirms their beliefs more than they seek out, pay attention to, or believe information that contradicts those beliefs.

When you apply these two principles to search suggestions, they predict that people are far more likely to click on negative search suggestions than on neutral or positive ones — especially when those negative suggestions are consistent with their own beliefs. This is exactly what the new study confirms.

Google data analysts know this too. They know because they have ready access to billions of pieces of data showing exactly how many times people click on negative search suggestions. They also know exactly how many times people click on every other kind of search suggestion one can categorize.

To put this another way, what I and other researchers must stumble upon and can study only crudely, Google employees can study with exquisite precision every day.

Given Google's strong support for Mrs. Clinton, it seems reasonable to conjecture that Google employees manually suppress negative search suggestions relating to Clinton in order to reduce the number of searches people conduct that will expose them to anti-Clinton content. They appear to work a bit less hard to suppress negative search suggestions for Mr. Trump, Senator Sanders, Senator Cruz, and other prominent people.

This is not the place to review the evidence that Google strongly supports Mrs. Clinton, but since we're talking about Google's search bar, here are two quick reminders:

First, on August 6th, when we typed "When is the election?," we were shown the following image:

© Photo: Google

When is the election?

See anything odd about that picture? Couldn't Google have displayed two photos just as easily as it displayed one?

And second, as reported by the Next Web and other news sources, in mid 2015, when people typed "Who will be the next president?," Google displayed boxes such as the one below, which left no doubt about the answer:

© Photo: Google

Who will be the next president?

Corporate Control

Over time, differentially suppressing negative search suggestions will repeatedly expose millions of people to far more positive search results for one political candidate than for the other. Research I have been conducting since 2013 with Ronald Robertson of Northeastern University has shown that high-ranking search results that favor one candidate can easily shift 20 percent or more of undecided voters toward that candidate — up to 80 percent in some demographic groups, as I noted earlier. This is because of the enormous trust people have in computer-generated search results, which people mistakenly believe are completely impartial and objective — just as they mistakenly believe search suggestions are completely impartial and objective.

The impact of biased search rankings on opinions, which we call the Search Engine Manipulation Effect (SEME), is one of the largest effects ever discovered in the behavioral sciences, and because it is invisible to users, it is especially dangerous as a source of influence. Because Google handles 90 percent of search in most countries and because many elections are very close, we estimate that SEME has been determining the outcomes of upwards of 25 percent of the national elections in the world for several years now, with increasing impact each year. This is occurring, we believe, whether or not Google's executives are taking an active interest in elections; all by itself, Google's search algorithm virtually always ends up favoring one candidate over another simply because of "organic" search patterns by users. When it does, votes shift; in large elections, millions of votes can be shifted. You can think of this as a kind of digital bandwagon effect. The new effect I have described in this essay — a search suggestion effect — is very different from SEME but almost certainly increases SEME's impact. If you can surreptitiously nudge people into generating search results that are inherently biased, the battle is half won. Simply by including or suppressing negatives in search suggestions, you can direct people's searches one way or another just as surely as if they were dogs on a leash, and you can use this subtle form of influence not just to alter people's views about candidates but about anything.

Google launched autocomplete, its search suggestion tool, in 2004 as an opt-in that helped users find

information faster. Perhaps that's all it was in the beginning, but just as Google itself has morphed from being a cool high-tech anomaly into what former Google executive James Whittaker has called a "an advertising company with a single corporate-mandated focus," so has autocomplete morphed from being a cool and helpful search tool into what may be a tool of corporate manipulation. By 2008, not only was autocomplete no longer an opt-in feature, there was no way to opt out of it, and since that time, through strategic censorship, it may have become a tool for directing people's searches and thereby influencing not only the choices they make but even the thoughts they think.

Look back at the searches I have shown you. Why does Google typically show you far fewer search suggestions than other search engines do â€” 4 or fewer, generally speaking, compared with 8 for Bing, 8 for DuckDuckGo and 10 for Yahoo? Even if you knew nothing of phenomena like negativity bias and confirmation bias, you certainly know that shorter lists give people fewer choices. Whatever autocomplete was in the beginning, its main function may now be to manipulate.

Without whistleblowers or warrants, no one can prove Google executives are using digital shenanigans to influence elections, but I don't see how we can rule out that possibility.

Perhaps you are skeptical about my claims. Perhaps you are also not seeing, on balance, a pro-Hillary bias in the search suggestions you receive on your computer. Perhaps you are also not concerned about the possibility that search suggestions can be used systematically to nudge people's searches in one direction or another. If you are skeptical in any or all of these ways, ask yourself this: Why, to begin with, is Google censoring its search suggestions? (And it certainly acknowledges doing so.) Why doesn't it just show us, say, the top ten most popular searches related to whatever we are typing? Why, in particular, is it suppressing negative information? Are Google's leaders afraid we will have panic attacks and sue the company if we are directed to dark and disturbing web pages? Do they not trust us to make up our own minds about things? Do they think we are children?

Without whistleblowers or warrants, no one can prove Google executives are using digital shenanigans to influence elections, but I don't see how we can rule out that possibility. There is nothing illegal about manipulating people using search suggestions and search rankings â€” quite the contrary, in fact â€” and it makes good financial sense for a company to use every legal means at its disposal to support its preferred candidates.

Using the mathematical techniques Robertson and I described in our 2015 report in the Proceedings of the National Academy of Sciences, I recently calculated that SEME alone can shift between 2.6 and 10.4 million votes in the upcoming US presidential race without anyone knowing this has occurred and without leaving a paper trail.

I arrived at those numbers before I knew about the power search suggestions have to alter searches. The new study suggests that autocomplete alone might be able to shift between 800,000 and 3.2 million votes â€” also without anyone knowing this is occurring.

Perhaps even more troubling, because Google tracks and monitors us so aggressively, Google officials know who among us is planning to vote and whom we are planning to vote for. They also know who among us are still undecided, and that is where the influence of biased search suggestions and biased search rankings could be applied with enormous effect.

The Google Mafia

A convergence of EVIL: Google, Amazon and Facebook use technology to enslave humanity, suppress knowledge and accelerate human suffering

(Natural News) With Amazon.com now purchasing Whole Foods, giving it a near-monopoly over multiple sectors of the U.S. economy, we are entering the age of corporate giants dominating and enslaving humankind. Apple has more debt-free cash than nearly all world governments, including the United States of America (which is drowning in debt). Google has a near-monopoly over all search results, a position of power it exploits to silence dissenting views and disconnect humanity from important knowledge. And Facebook suppresses all truthful information that challenges the false narratives of the globalists. Corporations like these abuse their power to enslave humanity rather than setting us free.

At the dawn of the invention of television, the technology was hailed as a way to bring uplifting education to

every corner of the globe. It didn't take long, however, before broadcast television was turned into a means to control the masses through the dissemination of fake news — which has been going on forever — and the programming of consumers to purchase branded products often made with toxic ingredients. The dream of turning TV technology into a mechanism to set humanity free was quickly crushed, and today it is widely known that the more hours people spend watching TV, the more unintelligent and unaware they are. (Do you know any intelligent, self-aware, healthy person who indulges in watching fake TV?)

Similarly, the internet was once hailed as a means to set humanity free. But that dream, too, has been crushed under the extreme censorship and obfuscation of internet-intensive businesses like Google, Amazon and Facebook. Here are just a few examples:

Google censors nearly all REAL news publishers from Google News, making sure that only FAKE (mainstream) media achieves visibility so that fake media narratives dominate public attention. Those fake narratives include everything from the collapse of WTC 7 from an office fires — to the pharmaceutical industry's ridiculously false claim that vaccines have never harmed any child in the history of the world. For all the same reasons, Google also algorithmically suppresses websites it doesn't like, including independent news publishers covering investigative stories on vaccines, GMOs and the climate change science hoax. Far from setting humanity free to find what they want on the internet, Google covertly limits search results to primarily those content sites that agree with globalist narratives, all of which are anti-human and anti-progress. Google is also pro-Big Pharma and bans the advertising of natural supplement products that help people prevent disease and reduce suffering.

Facebook follows a similar algorithmic censorship track, penalizing websites that dare talk about children being harmed by vaccines, science corruption in the genetic engineering industry, the dangers of pesticides or the scientifically validated benefits of carbon dioxide to planet Earth. Facebook manually assigns penalty scores to entire websites, crushing their reach and making sure their content can't even reach fans who have deliberately liked the site and want to receive its information. Mark Zuckerberg, the grandson of a Rockefeller, is being groomed for a position of globalist domination and says he might run for president. He's already obediently spouting every official lie that Hillary Clinton repeated on the campaign trail in 2016.

Amazon.com, founded by evil globalist Jeff Bezos, uses its marketplace dominance to promote the interests of the pharmaceutical industry while suppressing natural medicine. Did you know that Amazon is getting into the prescription drug business in the hopes of putting local pharmacies out of business? The company also bans FBA (Fulfilled By Amazon) activities with many nutritional supplements and botanical extracts that can prevent serious diseases such as cancer. Now that Amazon is purchasing Whole Foods, Jeff Bezos is likely going to use the same pro-pharma stance to try to transform Whole Foods stores into prescription drug pharmacy locations while eliminating most of Whole Foods' staff by replacing them with robots. Amazon has already pioneered robot-staffed retail stores and has also developed a way to eliminate human cashiers by using RFID tracking of all customers and the items they pick off the shelves. Whole Foods workers are already freaking out, realizing they're going to be replaced by robots and drones. In effect, Jeff Bezos will promote mass unemployment, mass drug addiction, the censorship of natural products and centralized control over retailing. All of this makes Jeff Bezos richer and more powerful, but it also destroys human dignity, human health and human knowledge. (For people like Jeff Bezos, selling opioids is a great business model because people keep buying them over and over again — 'til the impact on society be damned!)

Evil corporations, evil globalists and evil agendas

What do all these evil corporations and globalist leaders have in common? They are all enemies of humanity: They all promote toxic vaccines that are right now killing over 1,400 children a year in the U.S. alone, injuring another 100,000 plus annually.

They all promote Big Pharma's toxic medications that earn high profits.

They all suppress natural medicine, medicinal herbs and cannabinoids (CBD).

They all supported Hillary Clinton and promote Democrats, the DNC and big government. They all hated Trump just like they hate America, the Bill of Rights and the Second Amendment.

They all promote Monsanto, GMOs, glyphosate and pesticide chemicals as being good for humanity.

They all claim to be pro environment — even while supporting the corporations that poison our world with toxic chemicals that kill life and devastate ecosystems.

They all believe in censorship and suppression as a way to shore up their power and silence dissent. They all put profits first and humanity last. To them, human beings are just âuseless idiotsâ to be manipulated or exploited for profit. If Jeff Bezos could fire every single Whole Foods worker right now and replace them all with robots, he would absolutely do so.

They all believe the ends justify the means, which is why Jeff Bezosâ Washington Post feels justified in completely fabricating âanonymous sourcesâ to publish fake news in an attempt to overthrow the American Republic.

They all despise diversity of thought and demand absolute conformity and obedience to left-wing narratives covering everything from LGBT issues to the elimination of gun rights. Diversity of opinion is not allowed. Conformity is mandatory.

In effect, these corporations are pure evil. They are run by evil globalists and they ally themselves with other evil corporations that poison our planet, enslave humanity and seek to deprive us all of basic human liberty and dignity.

Youâre not helpless: Hereâs what you can do to protect your power, your liberty and your future. All these evil corporations depend on one thing to remain in business: Compliant consumers.

If people stop financially supporting these evil corporations, they will cease to exist. The only reason they continue to grow right now is because people continue to feed them economic resources.

Until now, many people had not been fully aware of just how evil these corporations truly are. They had no idea they were about to be enslaved and overrun by Google, Amazon, Facebook and other similar corporate entities. Suddenly, however, itâs becoming obvious to even those who previously decried such warnings as âconspiracy theories.â Suddenly even Whole Foods workers are waking up, flipping out and realizing they are all about to be made obsolete by the Jeff Bezos robot apocalypse. From Reuters:

âIâve heard that Amazonâs culture is really cutthroat. That worries me,â one bagger at a Providence, Rhode Island, store said.

At least one customer was concerned that an Amazon purchase would further distance Whole Foods from its roots as a purveyor of premium, organic and specialty foods.

âIâ think that they are a very profit-driven company, so there might be some streamlining as far as labor,â said Sasha Hardin, 28, of the Mount Pleasant store, who has been with Whole Foods for 6-1/2 years.

Here are some action items you can take right now to stop feeding these corporate monsters that are destroying our collective future:

1. Stop using Google. Find alternative search engines such as DuckDuckGo. For searching news and the independent media, use GoodGopher.com or read Censored.news each day, which aggregates headlines from the internetâs most censored indy news sites.
2. Stop using Facebook. Why would you divulge all the details of your private life to an NSA data collection front anyway? Facebook is nothing but a massive social network spy machine that ruins your life and makes you feel disconnected and depressed. Check out GAB.ai instead.
3. Stop shopping at Amazon.com and Whole Foods. Support local retailers and local grocers, or youâll soon find them all out of business. If you donât consciously decide to start shopping at other retailers, youâre going to wake up one day in a world totally dominated by Amazon, where natural health products are banned and prescription drugs are pushed for everything. For lab-verified natural health products, support the Health Ranger Store. For fresh produce, grow your own food or support your local grocers that provide organic and non-GMO options.
4. Make conscious choices about where you spend your money, knowing that every dollar you spend is a âvoteâ for that organization. Globalist organizations like Google, Amazon and Facebook are all about enslaving humanity and stripping you of knowledge, dignity and health. Vote for the kind of companies who share your belief in natural medicine, empowering individuals, decentralizing political power (returning power to local communities) and halting the mass poisoning of our world with pesticides and GMOs.

The power is in your hands.

Why is it dangerous for Google to be able to operate the private psychological and information profiles it keeps on every human? Because it makes thing like this happen:

âOver 200 million voter background files, created via Googleâs spying and data harvesting, have been

dumped on the web!

A data analytics contractor that spies on the public with help from Facebook and Google, left databases containing information on nearly 200 million potential voters exposed to the internet without security, allowing anyone who knew where to look to download it without a password.

"We take full responsibility for this situation," said the contractor, Deep Root Analytics, in a statement. The databases were part of 25 terabytes of files contained in an Amazon cloud account that could be browsed without logging in. The account was discovered by researcher Chris Vickery of the security firm UpGuard. The files have since been secured. Vickery is a prominent researcher in uncovering improperly secured files online. But, he said, this exposure is of a magnitude he has never seen before

"In terms of the disc space used, this is the biggest exposure I've found. In terms of the scope and depth, this is the biggest one I've found," said Vickery. The accessible files, according to UpGuard, contain a main 198 million-entry database with names, addresses of voters and an "RNC ID" that can be used with other exposed files to research individuals.

For example, a 50-gigabyte file of "Post Elect 2016" information, last updated in mid-January, contained modeled data about a voter's likely positions on 46 different issues ranging from "how likely it is the individual voted for Obama in 2012, whether they agree with the Trump foreign policy of 'America First' and how likely they are to be concerned with auto manufacturing as an issue, among others."

That file appears in a folder titled "target_point," an apparent reference to another firm contracted by the RNC to crunch data. UpGuard speculates that the folder may imply that the firm TargetPoint compiled and shared the data with Deep Root. Another folder appears to reference Data Trust, another contracted firm. UpGuard analyst Dan O'Sullivan looked himself up in the database and writes in the official report that the calculated preferences were, at least for him, right on the money.

"It is a testament both to their talents, and to the real danger of this exposure, that the results were astoundingly accurate," he said. The Deep Root Analytics cloud server had 25 terabytes of data exposed, including 1.1 terabytes available for download.

Over the 2016 election season, the RNC was a major client of Deep Root, one of a handful of firms it contacted for big data analysis. Firms like Deep Root Analytics use data from a variety of sources to extrapolate social and political preferences of voters to determine how best to market to them.

According to Ad Age, the RNC spent \$983,000 between January 2015 and November 2016 for Deep Root's services and \$4.2 million for TargetPoint's. "Deep Root Analytics builds voter models to help enhance advertiser understanding of TV viewership. The data accessed was not built for or used by any specific client. It is our proprietary analysis to help inform local television ad buying," said Deep Root Analytics in their statement.

Misconfigured cloud servers and online databases are a common way for data to be accidentally left exposed to the public. Vickery has found everything from military engineering plans to databases of believed terrorists in exactly this way.

What is uncommon in this case is the size and scope of this exposure. If its records are accurate, the Deep Root Analytics exposure contains information on more than half of the American population. It dwarfs the second-largest exposure of voter information â 93.4 million records of Mexican citizens â by more than 100 million voters and tops the largest data breach of voter information â 55 million records of Philippine voters â by more than 140 million.

Anyone who knew the files' web address could have accessed them. But without that knowledge, they are

much harder to find. Even armed with a search for unsecured databases, finding exposures of any magnitude is tough work. Vickery sifts through a large number of unsecured databases to find ones that interesting enough to publish research. Deep Root has contracted the security firm Stroz Friedberg to perform a thorough investigation of the exposure. The exposure, between June 1 and June 14, was sealed shut shortly after Vickery made the discovery during the night of June 12 and notified relevant regulatory bodies. â

Feds Shut Down Paris Climate Scam Because It Was Created to Put Trillions of Dollars in Obama's Silicon Valley Financiers Bank Accounts

Tom Steyer, Elon Musk, George Soros, Eric Schmidt, Vinod Khosla and John Doerr force USA to pull out of Paris Climate agreement because it is uncovered that they are using it for a private Silicon Valley Payola Scam!

It turns out that Obama had rigged the â Climate Dealsâ to criminally racketeer profits to Tom Steyer, Elon Musk, George Soros, Eric Schmidt, Vinod Khosla and John Doerr and F*ck everyone else over.

U.S. pull-out gives America a fresh start on the environment without all of the Silicon Valley racketeering and insider crony payola deals.

Reports filed with the new FBI (minus Comey-the-cover-up-king) to seek federal indictments of Tom Steyer, Elon Musk, George Soros, Eric Schmidt, Vinod Khosla and John Doerr!

Your Mind May Be Getting Raped By a Crazy Google Billionaire

By Shelley Floureâ

You just read a thing on a â web news siteâ !

It got you so upset!!!!!!

Those filthy Liberals or those Filthy Conservatives or those Filthy Immigrants or some-group-of-people-you-don't-like said a thing that makes you rationalize, more deeply, your hatred of â themâ !

But who actually caused that thing to get posted where you saw it?

The answer: Some crazy billionaire paid to post that!

Why would they do that?

Because they put money in their bank account equal to the hate and fear they can manufacture. Season 5 of the House of Cards TV show goes into detail about this. Worse yet, the money they put in their bank account came from your own wallet!

â Huh!? How does that work?â

Let me explain.

The U.S. Government spends TRILLIONS AND TRILLIONS of your dollars every year.

All of that money comes from your taxes and the money they take out of your pay check.

By â spending moneyâ the government hands those TRILLIONS AND TRILLIONS of dollars to certain people, and their companies, each year.

You probably canâ t even conceive of how much money a trillion dollars is. Think of it this way: with only ONE TRILLION dollars to work with, you could blow up the Moon or paint the entire Moon pink. Literally! ONE TRILLION DOLLARS is only a tiny percentage of how much the government hands out each year.

George Soros, Eric Schmidt, Warren Buffet, Larry Page, Mark Zuckerberg, Sheldon Adelson, or the other political billionaires, would kill your whole family to get their hands on those TRILLIONS.

While some of them do have people killed, actual murders are easier to catch these days. It is far less risky to kill ideas and causes. Either way, the TRILLIONS flow into their pockets because they are killing things.

Are you lost yet?

These handful of billionaires have tens of thousands of trolls and internet shills who create hate on the internet.

In Washington, DC, each thing that someone might hate has a Congressional Bill and a budget solution attached to it.

In order to solve the problem that a hated thing causes, the billionaires have their lobbyists, fabricate fake problems. Guess what!?! The billionaires that create the fabricated problem JUST HAPPEN TO OWN THE ONLY SOLUTION that the government can contract!

Thatâ s right! These billionaires create all these manufactured â issuesâ in order to put your tax money in their private bank accounts. They are tricking you into hate and fear so they can profit off of fabricated hate and fear!

â Climate Changeâ could only be solved by the companies that Barack Obamaâ s financiers owned. Interesting coincidence, huh?

Only Obamaâ s and Hillaryâ s buddy Elon Musk got government cash. Every other applicant got sabotaged by Obama. Teslaâ s funding was a crony payola scam!

The hundred year old problem of accessible health-care could suddenly only be solved by the Obamacare database companies that ONLY Barack Obamaâ s financiers owned.

Suddenly ISIS appeared and only by letting Obamaâ s CIA take over Google could â the bad guys be caughtâ ...except, not a single one was caught by the Silicon Valley surveillance net. A trillion dollars of â Big Dataâ contracts were sold by Amazon, Google and Facebook but they, not only, resulted in no interdictions but they CAUSED many attacks by missing the entire boat on some of the biggest, bloodiest, public attacks ever!

So, when you see reasons on the web to hate immigrants, Liberals or Conservatives. When you think you are supposed to put on a black face handkerchief and go riot with ANTIFA because â everybody else isâ , think again.

Almost NOBODY is actually concerned about most of these issues aside from getting their work done and getting home to their families.

All of these â problemsâ are manufactured by the owners of Facebook and Google in order to try to get

those TRILLIONS of dollars steered into their private bank accounts.

When you see an "issue" on the web.. Write George Soros and tell him to go F*ck himself and stop messing with your tax dollars and your mind!

Al Gore bought a \$10 million dollar mansion on the California coast in Montecito, California after telling the world that his Climate Change would flood the California Coast and make California coastal property the worst investment in history. Al Gore's partner and scam associate: Vinod Khosla (See the 60 Minutes Episode: The Cleantech Crash) took over California's favorite coastal town: Marina's Beach in Half Moon Bay, California; and has spent tens of millions of dollars on lawsuits to keep the public from using the public beach there. If these Kleiner Perkins mobsters actually thought Climate Change/Global Warming was real, they would never have spent vast fortunes buying coastal property, would they?

Over 35 (and growing) Obama DOE, EPA and NOAA senior staff have said that they were ordered to manipulate climate data in order to create financial profits for Al Gore's company: Kleiner Perkins. Kleiner Perkins created Google, the criminally corrupt search engine company that rigs search results for Kleiner Perkins political interests.

Nothing less than FBI raids of Kleiner Perkins and Google are needed now! These are organized crime, criminally corrupt, organizations!

This has nothing to do with "politics" and everything to do with ORGANIZED CRIME!

This has nothing to do with saving trees and everything to do with murders, racketeering and corruption!

Google's executives pay for, control and benefit from every one of these politicians illegal and corrupt actions!

Google, once disdainful of lobbying, now a master of Washington influence

Outside In A new era of influence

By Tom Hamburger and Matea Gold

In May 2012, the law school at George Mason University hosted a forum billed as a "vibrant discussion" about Internet search competition. Many of the major players in the field were there - regulators from the Federal Trade Commission, federal and state prosecutors, top congressional staffers. What the guests had not been told was that the day-long academic conference was in large part the work of Google, which maneuvered behind the scenes with GMU's Law & Economics Center to put on the event. At the time, the company was under FTC investigation over concerns about the dominance of its famed search engine, a case that threatened Google's core business.

In the weeks leading up to the GMU event, Google executives suggested potential speakers and guests, sending the center's staff a detailed spreadsheet listing members of Congress, FTC commissioners, and senior officials with the Justice Department and state attorney general's offices.

"If you haven't sent out the invites yet, please use the attached spreadsheet, which contains updated info," Google legal assistant Yang Zhang wrote to Henry Butler, executive director of the law center, according to internal e-mails obtained by The Washington Post through a public records request. "If you've sent out the invites, would it be possible to add a few more?"

Butler replied, "We're on it!"

On the day of the conference, leading technology and legal experts forcefully rejected the need for the government to take action against Google, making their arguments before some of the very regulators who would help determine its fate.

The company helped put on two similar conferences at GMU around the time of the 18-month investigation, part of a broad strategy to shape the external debate around the probe, which found that Google's search practices did not merit legal action.

The behind-the-scenes machinations demonstrate how Google — once a lobbying weakling — has come to master a new method of operating in modern-day Washington, where spending on traditional lobbying is rivaled by other, less visible forms of influence.

(Read the e-mails between Google and GMU officials)

That system includes financing sympathetic research at universities and think tanks, investing in nonprofit advocacy groups across the political spectrum and funding pro-business coalitions cast as public-interest projects.

The rise of Google as a top-tier Washington player fully captures the arc of change in the influence business. Nine years ago, the company opened a one-man lobbying shop, disdainful of the capital's pay-to-play culture.

Since then, Google has soared to near the top of the city's lobbying ranks, placing second only to General Electric in corporate lobbying expenditures in 2012 and fifth place in 2013.

The company gives money to nearly 140 business trade groups, advocacy organizations and think tanks, according to a Post analysis of voluntary disclosures by the company, which, like many corporations, does not reveal the size of its donations. That's double the number of groups Google funded four years ago.

This summer, Google will move to a new Capitol Hill office, doubling its Washington space to 55,000 square feet — roughly the size of the White House.

Google's increasingly muscular Washington presence matches its expanded needs and ambitions as it has fended off a series of executive- and legislative-branch threats to regulate its activities and well-funded challenges by its corporate rivals.

Today, Google is working to preserve its rights to collect consumer data — and shield it from the government — amid a backlash over revelations that the National Security Agency tapped Internet companies as part of its surveillance programs. And it markets cloud storage and other services to federal departments, including intelligence agencies and the Pentagon.

“Technology issues are a big — and growing — part of policy debates in Washington, and it is important for us to be part of that discussion,” said Susan Molinari, a Republican former congresswoman from New York who works as Google's top lobbyist. “We aim to help policymakers understand Google's business and the work we do to keep the Internet open and spur economic opportunity.” Molinari added, “We support associations and third parties across the political spectrum who help us get the word out — even if we don't agree with them on 100 percent of issues.”

As Google's lobbying efforts have matured, the company has worked to broaden its appeal on both sides of the aisle. Executive Chairman Eric Schmidt is a well-known backer of President Obama and advises the White House. Google's lobbying corps — now numbering more than 100 — is split equally, like its campaign donations, among Democrats and Republicans.

Google executives have fostered a new dialogue between Republicans and Silicon Valley, giving money to conservative groups such as Heritage Action for America and the Federalist Society. While also supporting groups on the left, Google has flown conservative activists to California for visits to its Mountain View campus and a stay at the Four Seasons Hotel.

The company has also pioneered new and unexpected ways to influence decision-makers, harnessing its vast reach. It has befriended key lawmakers in both parties by offering free training sessions to Capitol Hill staffers and campaign operatives on how to use Google products that can help target voters.

Through a program for charities, Google donates in-kind advertising, customized YouTube channels and Web site analytics to think tanks that are allied with the company's policy goals.

Google's fellows — young lawyers, writers and thinkers paid by the company — populate elite think tanks such as the Cato Institute, the Competitive Enterprise Institute and the New America Foundation. To critics, Google's investments have effectively shifted the national discussion away from Internet policy questions that could affect the company's business practices. Groups that might ordinarily challenge the policies and practices of a major corporation are holding their fire, those critics say.

“Google's influence in Washington has chilled a necessary and overdue policy discussion about the

impact of the Internetâs largest firm on the future of the Internet,â said Marc Rotenberg, a Georgetown University law professor who runs the Electronic Privacy Information Center, a watchdog and research organization.

Some with deep ties to the company say that Googleâs embrace of aggressive lobbying was a necessary concession to the realities of Washington.

â I donât fault Google for playing that game, in which big companies use their money to buy advocates and allies,â said Andrew McLaughlin, who served as Googleâs first director of global public policy in Washington. â Given where the company is today, the fiduciary duty it has to shareholders and the way Washington works, itâs a rational judgment.â

Google goes to lunch

An early sign of Googleâs new Washington attitude came in September 2011, when executives paid a visit to the Heritage Foundation, the stalwart conservative think tank that has long served as an intellectual hub on the right, to attend a weekly lunch for conservative bloggers.

The session took place at a critical juncture for the company.

Days earlier, Schmidt had endured a rare and unnerving appearance on Capitol Hill, where he was lectured by a Republican senator who accused the company of skewing search results to benefit its own products and hurt competitors. The FTC antitrust inquiry was underway. And, in what Google saw as a direct threat to the open Internet, major lobbies such as the U.S. Chamber of Commerce and the Motion Picture Association of America were mounting a legislative campaign to place restrictions on the sale of pirated music and movies. The effort was getting bipartisan traction in the House and the Senate.

Google Executive Chairman Eric Schmidt testifies before a Senate Judiciary antitrust subcommittee in September 2011. (Chip Somodevilla/Getty Images)

Inside Googleâs Washington headquarters, a handful of lobbyists were crafting what they called the â Republican strategyâ to defeat the legislation. Their approach: build conservative opposition based on the rightâs distaste for regulation. They also seized on an obscure provision that they told Republicans would be a boon for trial lawyers, a Democratic constituency.

As the campaign took shape, there was a building sense within the company that it needed to beef up its firepower on the Hill. That fall, Googleâs first Washington lobbyist, a computer scientist and lawyer named Alan Davidson, a Democrat, would announce his resignation, replaced a few months later by the former GOP lawmaker, Molinari.

In their visit to Heritage that day, Google officials were eager to make new friends. Their challenge was instantly clear.

â In 2008, your CEO campaigned for Barack Obama,â said Mike Gonzalez, Heritageâs vice president for communications, according to a video of the event. â.â.â. As a company, youâre really identified with this administration from the beginning. And you come here and youâre like a mix of Milton Friedman and Friedrich Hayek.â

Adam Kovacevich, then a member of Googleâs policy team, responded by stressing the companyâs interest in building new alliances.

â One of the things weâve recognized is that no company can get anything done in Washington without partnerships on both sides of the aisle,â he said.

He noted the recent hiring of Lee Carosi Dunn, one of several former top aides to Sen. John McCain (R-Ariz.) brought on by the company.

Dunn, addressing the audience, promised â a lot of reach-out to Republicans.â

â I think itâs another lesson young companies that come to Washington learn â you canât put all your marbles in one basket,â Dunn said. Referring to the editor of the conservative Weekly Standard, Dunn added: â Look, even Bill Kristol was walking around wearing Google glasses. Weâre making strides!â

The Google-Heritage relationship soon blossomed â with benefits for both.

A few weeks after the blogger session, Heritage researcher James L. Gattuso penned a critique of the antitrust investigation into Google, praising the company as â an American success story.â

That winter, Heritage joined the chorus of groups weighing in against the anti-piracy legislation. As the bill, the Stop Online Piracy Act, appeared to gain steam in the GOP-led House, Gattuso wrote a piece warning of unintended negative consequences for the operation of the Internet and free speech. The legislation, he said, could disrupt the growth of technology. Gattuso said he came to his position independently and was not lobbied by Google.

After Gattuso's piece went live, Heritage Action, the think tank's sister advocacy organization, quickly turned the argument into a political rallying cry. In terms aimed at tea party conservatives, the group cast the bill as another government power grab.

In mid-January 2012, Heritage Action designated the legislation a key vote it would factor into its congressional race endorsement decisions heightening the pressure on Republicans.

The next day, leading Internet sites, including Wikipedia, went dark as part of an online blackout protesting the bills.

Google turned its iconic home page into a political platform for the first time, urging users to sign a petition against the legislation. Seven million people added their names, and many of them added their e-mails, creating a valuable activist list for Google to mobilize then and in later fights.

As congressional offices were flooded with phone calls and e-mail protests, support for the legislation crumbled. Within days, both the House and Senate versions of the bill were shelved and Hill veterans were left marveling at the ability of Google and its allies to muster such a massive retail response.

For Google and Heritage, the legislative victory was the beginning of a close relationship. A few months later, Google Ideas and the Heritage Foundation co-hosted an event focused on the role the Internet could play in modernizing Cuba, featuring Sen. Marco Rubio (R-Fla.) and Google Ideas director Jared Cohen.

The following year, a new name popped up on Google's list of groups it supports financially: Heritage Action.

GMU conferences

Facing a broad and potentially damaging FTC probe, Google found an eager and willing ally in George Mason University's Law & Economics Center.

The center is among the academic programs at universities such as Harvard and Stanford that have benefited from Google's largesse. For the past several years, the free-market-oriented law center has received an annual donation from the company, a grant that totaled \$350,000 last year, according to the school.

Google's relationship with the law center proved helpful in the summer of 2011 as speculation mounted that the FTC was going to launch an antitrust investigation of the tech giant. The company's rivals, including Microsoft and Yelp, were aggressively pressing arguments that Google was exploiting its dominance in the search business.

On June 16, 2011, Google and the law center put on the first of three academic conferences at the GMU law school's Arlington County campus, all focusing on Internet search competition. It was eight days before the company announced it had received formal notification it was under FTC investigation.

Google was listed as a co-sponsor of the day-long forum, but some participants were still struck by the number of speakers who took a skeptical view of the need for antitrust enforcement against the company, according to people in attendance.

The keynote address was by Google engineer Mark Paskin, who delivered a lunchtime speech titled Engineering Search.

A few days later, Christopher Adams, an economist in the FTC's antitrust division who later worked on the Google investigation, e-mailed Butler, the law center's director, to thank him for putting on the conference. I think it was one of the best policy conferences that I've been too [sic], Adams wrote, praising Paskin's talk as excellent.

Adams declined to comment for this article, referring questions to the FTC press office.

FTC spokesman Justin Cole said the agency's staffers are required to adhere to established federal government ethics rules and guidelines. Attendance and participation in the 2011 and 2012 GMU conferences by our staff adhered to these guidelines.

As the agency's investigation stretched into its second year, the staff and professors at GMU's law center were in regular contact with Google executives, who supplied them with the company's arguments

against antitrust action and helped them get favorable op-ed pieces published, according to the documents obtained by The Post.

The school and Google staffers worked to organize a second academic conference focused on search. This time, however, Google's involvement was not publicly disclosed.

Months before the event, Zhang, the Google legal assistant, e-mailed Chrysanthos Dellarocas, a professor in the Information Systems Department at Boston University's School of Management, to suggest he participate. Dellarocas had received \$60,000 in 2011 from Google to study the impact of social networks on search.

"We'd love for you to submit and present this paper, if you are interested and willing," she wrote.

When GMU officials later told Dellarocas they were planning to have him participate from the audience, he responded that he was under the impression from "the folks at Google who have funded our research" that they wanted him to showcase his work at the event. He said he wanted "to be in compliance with our sponsor's expectations."

Dellarocas, who had a schedule conflict and ultimately did not attend, told The Post that while Google occasionally checked on his progress, the company did not have any sway over his research.

"At no point did they have any interference with the substance of my work," he said.

Even as Google executives peppered the GMU staff with suggestions of speakers and guests to invite to the event, the company asked the school not to broadcast its involvement.

"It may seem like Google is overwhelming the conference," Zhang fretted in an e-mail to the center's administrative coordinator, Jeffrey Smith, after reviewing the confirmed list of attendees a few weeks before the event. She asked Smith to mention "only a few Googlers."

Smith was reassuring. "We will certainly limit who we announce publicly from Google," he replied.

A strong contingent of FTC economists and lawyers were on hand for the May 16, 2012, session, whose largely pro-Google tone took some participants aback. "By my count, out of about 20 panelists and speakers, there were 31 / 2 of us who thought the FTC might have a case," said Allen Grunes, a former government antitrust lawyer who served on a panel and described the conference as "Google boot camp." Grunes said he was not aware of Google's role organizing the event until informed of it by a Post reporter.

Daniel D. Polsby, dean of GMU's School of Law, which houses the center, said that while Google provided suggestions, the agenda and speakers were determined by university staffers. "I think it would misrepresent this conference to suggest that it was a Google event," he said, adding that the law center discloses on its Web site the support it gets from Google and other corporations.

Google declined to comment about the conferences.

In January 2013, after an investigation that spanned more than a year and a half, the FTC settled the case with Google, which agreed to give its rivals more access to patents and make it easier for advertisers to use other ad platforms.

But when it came to the charges that Google biased its search results to promote its own products, the five FTC commissioners all voted to close the investigation, saying there was no evidence the company's practices were harming consumers.

Jon Leibowitz, then the chairman of the agency, said in an interview that the FTC was not affected by Google's campaign, noting that the company's rivals were waging a parallel effort on the other side. "It didn't bother me that a lot of people were building events around the possibility of the FTC investigation," said Leibowitz, who has since left the FTC. "That's sort of life in the big city, and both sides were doing it."

Sen. Marco Rubio (R-Fla.) discusses the U.S. economy in a March speech at a Jack Kemp Foundation forum at Google's Washington offices. (T.J. Kirkpatrick/For The Washington Post)

Attendees listen to Rubio's speech. While also supporting groups on the left, Google has courted conservative groups and lawmakers in recent years. (T.J. Kirkpatrick/For The Washington Post)

NSA fallout

On a February night this year, Schmidt sat down with a Washington audience far friendlier than the panel of senators who had grilled him nearly three years earlier. Addressing a dinner of journalists and scholars at the libertarian Cato Institute, Schmidt received applause and lots of head-nodding as he declared, â We will not collaborate with the NSA.â

Cato was not always in sync with Googleâs policy agenda. In previous years, the think tankâs bloggers and scholars had been sharply critical of the companyâs support for government rules limiting the ways providers such as Comcast and Verizon could charge for Internet services.

But, like many institutions in Washington, Cato has since found common ground with Google.

And the think tank has benefited from the companyâs investments, receiving \$480,000 worth of in-kind â ad wordsâ from Google last year, according to people familiar with the donation.

Schmidtâs message to Cato that night in February reflected the current focus of Googleâs energy â containing the fallout from revelations by NSA leaker Edward Snowden.

As the publicâs outrage has grown, the tech giant has tried to keep the focus on limiting government surveillance, not on the data collection done by private companies. A White House review of those issues is expected to be released this coming week.

A campaign against government spying, meanwhile, is in high gear, drawing together some unexpected bedfellows. The American Civil Liberties Union, Heritage Action, Americans for Tax Reform and the Center for Democracy & Technology have formed a coalition calling for the government to obtain a probable-cause warrant before getting access to e-mails and other electronic data.

The coalition, Digital 4th, is funded by Google.

Googleâs Hookers and Epic Sex Scandals Prove That Google Has No Morals and Exists To Abuse Others

Horrific Google Anal Sex Slave Case Uncovers Twisted Perversions Of Google Executives

By Samantha Conners - APT

Michael Goguen, Google's married senior investor, â sexually and physicallyâ abused Amber Laurel Baptiste with constant anal sex over more than 13 years after picking her up at a Texas strip club. His company: Sequoia Capital, has had other run-ins with cheating married executives, escorts and tax evasion schemes, per legal filings.

Eric Schmidt, the head of Google, proclaimed that he would have a â open marriageâ where he could have sex any time, with anybody, and is documented in a ream of news articles and video regarding his fifteen million dollar â sex penthouseâ in New York.

Sergey Brin, another head of Google, is featured in numerous news articles for his â three way sex rompâ with multiple Google employees forcing one employee to move to China to escape him.

A married Google senior executive named Hayes, who helped rig Google's searches for political clients, was murdered on his â sex yachtâ by his prostitute, which other Google executives had used.

Ravi Kumar, another VC associated with Google Executives, was also murdered by a pack of hookers and pimps that frequented his Silicon Valley home.

Valley Girls was a private escort service that used Stanford Co-eds to service the sexual kinks of Google executives.

Ellen Pao famously sued Google founding investor John Doerr, and his company Kleiner Perkins, for sexual abuse.

Google employee divorce filings hold the Silicon Valley record for use of the word â abuseâ as one of the reasons given in the legal papers filed to initiate the divorce.

The list of kinky, twisted, bizarre sexual antics of Google executives, and their investors, goes on for pages and pages...

Google seems to attract the most twisted, perverted, morally decrepit men in the world.

One has to wonder why, of all the large companies on Earth, only Google got to place the majority of it's

people in the White House? That's right, Nike doesn't have it's people in the White House. Macy's doesn't either. Neither does Chevron, or John Deere tractor or any other company on Earth. Only Google, exclusively and uniquely, had all of their people placed in the White House and top federal agency lead positions. What's up with that? Were they selected because of their technical skills or their ability to make people bend over?

An addiction to dirty sexual perversions are not the only illicit trends that Google folks display. The Google investors are members of a financing cartel called the National Venture Capital Association (NVCA). This group of frat boy elitists got busted for running the "Angelgate" scandal in which they were documented rigging, colluding, black-listing and contriving the whole Silicon Valley start-up industry. Then they were caught again when Eric Schmidt, Mr. "Sex Penthouse" and the head of Google, wrote emails ordering a conspiracy against Silicon Valley engineers. This "No Poaching" conspiracy got the Silicon Valley VC's sued in a class-action lawsuit, which the VC's lost. The Google founder's best friend: Jacques Littlefield, kept the world's largest private fully functional military tank squadron, in fully operational status, hidden in vast warehouses in his Silicon Valley estate in Woodside, California. He said he had this arsenal: "just in case". Does Google make white frat house men insane or does it draw the crazy ones to it?

The FBI is finally crunching down on these people. After so many years of the White House ordering the FBI to leave the Google VC's and Silicon Valley perverts alone, it was just getting plain embarrassing for the FBI. The audacious impunity with which Google, and it's friends, engaged in tax evasion, importing hookers, bribery, stock market rigging, anti-trust schemes and other crimes has become so overt, in the media, that it was created a spotlight on federal law enforcements avoidance of prosecution of the shenanigans of the Google crowd.

Google Executives Pay Stanford University Sorority Girls For Sex. Female Students Have Google "Sugar Daddies" Put Them Through College

Google's married Forrest Hayes dies in sex orgy on sex yacht paid for by his Google cash. Google's Eric Schmidt has a "Sex Penthouse". Google's Sergey Brin was in a 3-way sex scandal...and the list goes on...

Google Is Using Its Immense Power To Censor Content That Doesn't Fit Its Political Goals. Everyone In America Should Be Concerned About That

[NEIL PATEL](#)

2:15 PM 12/15/2017

193

The Daily Caller released a funny video Tuesday of FCC Chairman Ajit Pai defending the commission's upcoming net neutrality rollback. Through Wednesday and Thursday, liberals and others who dislike Pai's political position lost their minds. And by Friday morning, Google, one of the most powerful companies on the planet, had censored the video based on a bogus claim from a politically motivated man.

It took seven crucial hours and the full force of our news site to push Google and YouTube to reverse this political censorship. We were able to prevail because of the sizable contacts and resources of TheDC. An average citizen showcasing a political viewpoint Google and the left disagreed with would almost certainly have had a far more difficult and fruitless time fighting back.

At TheDC, we knew that releasing a [video](#) of Pai fidget-spinning in a Santa suit, swinging lightsabers and playing with a puppy a day before the FCC's net neutrality vote would ruffle some feathers. We were prepared for the hyperventilating over the video to reach a fever pitch as the Obama-era internet regulations were rolled back Thursday afternoon. Indeed, the video was viewed millions of times over a 24-hour period, was featured in a broad spectrum of news mediums, and spawned an avalanche of memes on Reddit.

In producing the video, we never advocated for Pai or the new net neutrality regulations, and you should check out [our in-depth interview with him here](#) on race and the internet. The video was meant to tell Pai's version of the net neutrality battle in a non-traditional, non-linear way.

WATCH:

Play Video

Any honest viewer of this video would see that.

Unfortunately, the seething outrage over the net neutrality issue poisoned the well far beyond critics' ability to appreciate parody. The video, and those featured in it, were viciously attacked. The "likes" to "dislikes" were comically ratioed, 5,000 to 144,000 at last count.

Then, as the left often does with content that offends them, they started a campaign to strip the video from the internet.

That happened to us, without warning, on YouTube Friday morning.

Our Pai video was removed because of a copyright claim for "I wait for it" "The Harlem Shake."

Screenshot/The Daily Caller)

(Photo:

â The Harlem Shakeâ is an embarrassingly outdated internet trope that peaked in popularity approximately four years ago. Like much of the content in the video, it was there to make a point in a funny way. A simple search on Youtube shows over 7,000,000 videos using long segments of the song with billions upon billions of total views. Our video used only a few seconds of the song and was not monetized â we were not making profit from this silly rendition of the FCC chairman dancing to a few seconds of a song uploaded to the internet multi-millions of times.

Because it featured a Republican against net neutrality, however, the triggering began.

The song is owned and licensed by record label Mad Decent, who demanded the platform remove the video, not because anyone was making profit off their work, but because they openly disagreed with the political worldview of the man dancing to it.

Baauer, the DJ who created the song, openly admitted on [Twitter](#) that he was targeting our video because he doesnâ t like its political message. He called Pai a â loserâ and said â I support net neutrality like the vast majority of this country and am appalled to be associated with its repeal in anyway (SIC).â His sudden concern for copyright law is even more laughable, considering he created â Harlem Shakeâ by [sampling another artistâ s vocals](#) without permission, which is itself a fair use.

YouTube, a Google-owned company who supports net neutrality, willingly complied with Mad Decentâ s request. This is not in any way standard practice for the platform, which thrives because its creators liberally flex fair-use content.

Fair use, [defined](#) by Stanford Law, is the use of copyright material â to comment upon, criticize, or parody a copyrighted work.â

Fair use is any copying of copyrighted material done for a limited and â transformativeâ purpose, such as to comment upon, criticize, or parody a copyrighted work. Such uses can be done without permission from the copyright owner. In other words, fair use is a defense against a claim of copyright infringement. If your use qualifies as a fair use, then it would not be considered an infringement.

The FCC chairman dancing with a lightsaber to “The Harlem Shake” is an obvious parody. What’s more, the entire video and the very short clip of the song were there as a commentary on the whole network-neutrality debate. This is as open-and-shut a case of fair use as has ever existed.

As soon as we discovered that The Daily Caller’s video had been removed, our chief operations officer reached out to Google for answers. The video was restored after approximately seven important hours down.

Getting Google to treat content fairly shouldn’t require being a company with the size and influence of The Daily Caller.

The network-neutrality debate over whether the large internet providers will discriminate based on their commercial or political interests is raging in America. It’s a good debate to have.

While we are debating, however, Google is quietly and arbitrarily using its massive power to censor the internet.

YouTube’s targeting of Daily Caller content and its willingness to remove our video for political purposes while millions of other uses are allowed to remain on the platform should stand as a terrifying prospect for every American.

It follows a disturbing trend of platforms and networks [devaluing](#) and [restricting](#) content based on political viewpoints.

This is an important moment, for us and for all publishers who supposedly value “neutrality” on the internet.

Watch our “Newsmakers” interview with Pai:

Google Is Using Wi-Fi To Track Your Precise Location And Spy On You: Oracle

To say that Google knows more about you than you know about yourself would not be an exaggeration. In a fresh attack on Google, Oracle has submitted a 17-page attachment titled **Google's Shadow Profile** to Australian Competition and Consumer Commission's digital platform inquiry.

Oracle has accused Google of building profiles of Australian users by logging their data. This profile consists of their **secret interests**, **intimate lifestyle details** and their office and home address.

As per Oracle, *If a consumer connects to the same Wi-Fi access point at 9am Monday-Friday, the Wi-Fi base station likely represents the consumer's place of work.*

Similarly, if a consumer connects to the same base station every day at 7pm and stays connected through the evening, the station is likely located in the consumer's home.

Oracle has blamed Google for violating the laws by hiding the real motive behind its data collection policies. According to the RDBMS software providing company, the search giant logs users' data for targeted advertisements thus fulfilling its own selfish motive.

When combined with users' browsing patterns, search history, and other data collected via its apps, the tech giant has created an **intimate dossier of users' lifestyle**.

In addition to Oracle's submission, ACCC has received submissions from 26 other companies. News Corp Australia, one of the largest Australian media companies, has urged the authorities to **force Google to sell Google Search** to end the company's hegemony in online advertising and digital search industry.

What do you think must be done to limit what Google knows about you? Should the giant be forced for divestment? Let us know in the comments below.

Google Issues Ultimatum to Conservative Website: Remove Anti-Google Article or Lose Ad Revenue

BY [TYLER O'NEIL](#)

[CHAT 465 COMMENTS](#)

Google

On Tuesday evening, Google sent a conservative website an ultimatum: remove one of your articles, or lose the ability to make ad revenue on your website. The website was strong-armed into removing the content, and then warned that the page was "just an example and that the same violations may exist on other pages of this website."

"Yesterday morning, we received a very bizarre letter from Google issuing us an ultimatum," Shane Trejo, media relations director of the Republican Liberty Caucus of Michigan, [wrote on The Liberty Conservative](#). "Either we were to remove a particular article or see all of

our ad revenues choked off in an instant. This is the newest method that Big Brother is using to enforce thought control."

The ultimatum came in the form of an email from Google's ad placement service AdSense. The email specifically listed an article on The Liberty Conservative's site, stating that the article violated AdSense's policies.

"As stated in our program policies, Google ads may not be placed on pages that contain content that: Threatens or advocates harm on oneself or others; Harasses, intimidates or bullies an individual or group of individuals; Incites hatred against, promotes discrimination of, or disparages an individual or group on the basis of their race or ethnic origin, religion, disability, age, nationality, veteran status, sexual orientation, gender, gender identity, or other characteristic that is associated with systemic discrimination or marginalization," the email stated.

The email warned The Liberty Conservative that it must either remove ads from that page, or "modify or remove the violating content to meet our AdSense policies."

"Please be aware that if additional violations are accrued, ad serving may be disabled to the website listed above," the AdSense email warned. "Please be aware that the URL above is just an example and that the same violations may exist on other pages of this website or other sites that you own."

Trejo argued that the article Google specified "contained no offensive content." Rather, it "was merely distinguishing the many differences between the alt-right and literal Nazis."

The Liberty Conservative writer suggested that the article was singled out because it was written by former Liberty Conservative contributor James Allsup. Allsup was involved in the "Unite the Right" riot (which Trejo described as a "rally-turned-riot") in Charlottesville, Va. Trejo said the article was targeted because "it was authored by a man deemed to be an 'unperson' by the corporate elite."

"Due to financial constraints, we had to comply with Google's strong-arming tactics for the time being," Trejo admitted. "An independent publisher such as The Liberty Conservative needs revenue from the Google ad platform in order to survive."

[\[UPDATED\] Daily Stormer to Disappear From the Internet After Insulting Victim of Deadly Car-Ramming in Charlottesville](#)

Despite this necessary surrender, The Liberty Conservative writer remained optimistic. "We look forward to the day where rival ad platforms who respect the intellectual freedom of their customers can outcompete Google, but those days have not arrived yet," he wrote. "These tech companies have us all by the short hairs, and post-Charlottesville, they are all working in unison to enforce the Orwellian nightmare. Nobody is safe."

Chillingly, Trejo called on "all conservatives and libertarians" to "realize that the Orwellian nightmare enforced by private hands is just as harmful to human freedom as if the dystopia was enforced by the hands of government commissars. The results will be the same, as freedom of expression will be sacrificed to the God of political correctness."

This was not the first time The Liberty Conservative faced censorship, Trejo added. "In the past, Facebook banned users from sharing content immediately after they posted our [controversial article criticizing a 'libertarian' Washington D.C. thinktank official](#) who denigrated Ron Paul," he wrote. But this was the first time the site faced demonetization.

Earlier this week, [The Washington Post reported](#) that Google was targeting critics in academia and journalism. The company has come under fire for [firing senior software engineer James Damore](#) after he published a controversial memo inside the company. Ironically, he accused Google of being an "ideological echo chamber," and his dismissal arguably proved his point.

Following the riots in Charlottesville, one website in particular [became notorious for its hateful attack on Heather Heyer](#), who died in the riots. Daily Stormer was a white supremacist, neo-Nazi website, and its article was genuinely hateful, so the web hosting company GoDaddy gave the site a 24-hour notice before removing the site from the Internet. Google later announced that it would cancel the domain registration, removing the possibility of Daily Stormer remaining on the Internet.

Daily Stormer was legitimately hateful, but its removal from the Internet can set off a [slippery slope of Internet blacklisting](#), which has arguably already begun. Google's ultimatum to The Liberty Conservative may be the next step in that direction.

If Trejo is correct, and the article in question was targeted merely because of its author rather than for any particular "hatred"-inciting content, AdSense's threat violated its own policies â unless the very name of a Charlottesville rioter is to be considered "discriminatory" speech towards minorities.

[Daily Stormer was disgusting](#), and because The Liberty Conservative article has been removed from the Internet, PJ Media could not ascertain whether it was legitimately offensive. But even if it was, these attacks set a dangerous precedent.

[5 Things to Know About James Damore's Google Manifesto](#)

The Southern Poverty Law Center (SPLC) is a cash cow that uses its coffers to slander mainstream conservative and Christian organizations as "hate groups." The SPLC began by tracking real hate groups like the Ku Klux Klan and black nationalist groups, but later it added mainstream groups to its list.

The SPLC publishes a list of "hate groups" â along with a "hate map" â that lists Christian organizations like [D. James Kennedy Ministries](#), [the Family Research Council \(FRC\)](#), [Liberty Counsel](#), the American Family Association (AFA), and [Alliance Defending Freedom \(ADF\)](#), along with other groups like the American College of Pediatricians and the Center for Immigration Studies. It also lists Muslim reformer Maajid Nawaz as an "anti-Muslim extremist."

This matters because in the summer of 2012, Floyd Lee Corkins III broke into the FRC, aiming to murder everyone in the building. Corkins later [pled guilty](#) to committing an act of terrorism and was [sentenced to 25 years in prison](#). During an FBI interrogation, the shooter said he targeted FRC because it was listed as an "anti-gay group" on the SPLC website.

The man who shot Rep. Steve Scalise (R-La.), James Hodgkinson, [also "liked" the SPLC on Facebook](#), and the SPLC repeatedly attacked Scalise.

Since the events in Charlottesville, the SPLC has received wide support. [George Clooney and his wife Amal](#) pledged \$1 million to the group, and [J.P. Morgan](#) pledged \$500,000. Apple CEO Tim Cook was [even more generous](#), announcing his company would give \$1 million to the SPLC, that it would match any donations from employees, and that it would set up a system in iTunes software to let consumers directly donate to the organization.

CNN broadcast the [SPLC's "hate map"](#) on its website and Twitter account this month (with the FRC still marked on the map). In June, the charity navigation website GuideStar [adopted the SPLC "hate group" list](#), marking each profile of the targeted organizations as a "hate group." ABC and NBC [parroted the SPLC's "hate group" label against Alliance Defending Freedom \(ADF\) last month](#).

If Google is targeting websites with any connection to white supremacists, in order to take them off the Internet after Charlottesville, and Apple and CNN are partnering with the SPLC to tar mainstream conservative, Christian, and anti-Islamist groups as on par with the KKK, it is not a stretch to think that Google might start targeting mainstream sites next.

Should Google, Apple, and GoDaddy decide to "fight hate" by following the SPLC and abolishing all of its "hate groups" from the Internet, the Left would effectively silence the Right overnight.

The Liberty Conservative is not National Review, but it's not Daily Stormer, either.

Many turn to the words of Lutheran Minister Martin Niemöller, who warned in the time of the Holocaust, "First they came for the Socialists, and I did not speak out â Because I was not a Socialist." Then they came for other groups, and he did not speak out. But: "Then they came for meâ and there was no one left to speak for me."

[Apple to Give Over \\$2M to Terror-Linked Group Which Compares Christians to the KKK](#)

First they came for Daily Stormer. Then they came for The Liberty Conservative. Then they came for the Family Research Council. LGBT activists speak openly about "[punishing the wicked](#)," by which they mean anyone who refuses to take part in a same-sex wedding.

Internet blacklisting should scare any American who loves free speech. Every American should speak up about websites being removed from the Internet, because once tech companies start "fighting hate," it doesn't end with Daily Stormer or even The Liberty Conservative. The SPLC won't let it end there. Americans must speak up, or their views might be next on the blacklist.

[Google Launches Password Checkup Extension to spy on all of your passwords](#)

[Google has announced](#) a new extension for Google Chrome called [Password Checkup](#) that will monitor the passwords that you type into websites to see if they have been compromised in a third-party data breach. Google says it has access to over 4 billion credentials that have been compromised and Password Checkup will issue a warning if it detects you using a credential that is known to be unsafe. Google worked with cryptography experts at Stanford University to incorporate protections that ensure your privacy is maintained by encrypting your credentials and making sure that they are never revealed to Google. The tool also has safeguards built-in to keep hackers from abusing it to reveal unsafe usernames and passwords. The Password Checkup extension will be improved over the coming months with better site compatibility and password field detection.

At a high level, Password Checkup needs to query Google about the breach status of a username and password without revealing the information queried. At the same time, we need to ensure that no information about other unsafe usernames or passwords leaks in the process, and that brute force guessing is not an option. Password Checkup addresses all of these requirements by using multiple rounds of hashing, k-anonymity, private information retrieval, and a technique called blinding.

Google Lawsuit: Senior Engineer Alon Altman Wanted to Sabotage Trump's Android Phone, Ban His Gmail Account

by [ALLUM BOKHARI](#) 19 Apr 2018 [5026](#)

Alon Altman, a senior software engineer at Google, pressured the company to sabotage President Trump's Android phone, according to new evidence released via James Damore's class-action [lawsuit](#) against the company.

Calling on the tech giant to use the "full economic force [of] Google for good", Altman also suggested deleting the gmail accounts of Trump, his administration, and his aides for "abuse."

Altman "who is [still employed](#) by the tech giant" also called on Google to blacklist "alt-right" sites on the Google ad network (she falsely included Breitbart News in this category "an assertion [refuted](#) by a Harvard and M.I.T. study), and take down all "alt right videos" from YouTube. She also called on the tech giant to remove "neo-Nazi sites such as 'The Daily Stormer'" from the Google search index.

advertisement

Altman has been employed at Google for seven years, and according to inside sources, is one of the most radical leftists at the company. She was named as one of the key architects of political discrimination at Google by a [whistleblower](#) we interviewed last August. As we have reported, she has previously called on the company to [discipline or terminate](#) any employee who agreed with James Damore's viewpoint diversity manifesto, which argued that there was an atmosphere of political intolerance at Google.

Google seemed to follow at least one of Altman's suggestions, effectively [kicking The Daily Stormer off the internet](#) in August 2017, a move that was condemned even by the left-leaning Electronic Frontier Foundation (EFF).

While Google did not follow Altman's suggestion to remove Breitbart News from its ad network, its employees have begun advising clients to steer clear of Breitbart News, as we [exclusively reported](#) in February.

More evidence that Google's ad departments are trying to undermine the revenue of conservative sites has just been released via the Damore lawsuit.

According to the lawsuit, when Google's Large Customer Sales (LCS) team learned that the Canadian conservative news site The Rebel Media had been targeted by the far-left group Sleeping Giants,

they used this as an excuse to advise clients to remove ad placements from conservative websites.

In a template email to Google clients, Marshall Self, Director of Agency at Google, recommended that clients take advantage of Google's wide number of controls, including placement exclusions and filters for political content to remove ads from specific sites, apps, YouTube channels and videos.

This is the latest information that has been released as part of the Damore lawsuit. Yesterday, we [reported](#) that Google cautions many of its managers against rewarding behavior that caters the values of a white-male dominant culture, including a meritocracy, a individual achievement and avoiding conflict.

[Three new plaintiffs](#) have joined Damore's lawsuit against Google, which alleges that the company discriminates against white, Asian, male, and conservative individuals.

EXCLUSIVE: Google Leftists Panic About Leaks, Threaten Employment of Colleagues

Adrian

*Dennis/AFP/Getty*ALLUM BOKHARI 18 Apr 2019587

4:13

Left-wing employees at Google are threatening the employment of their colleagues amid a panic about frequent leaks revealing political bias in the company's products and working atmosphere.

Leaked internal discussion threads from Google provided exclusively to Breitbart News show left-wing Google employees reporting one of their colleagues for alleged "leaks," while worrying about the legal implications of cracking down on a conservative at the company over his public complaints about working conditions.

The discussion took place last week on the "transparency and ethics" discussion group, from which the alleged leaker had recently been ejected "a failed attempt to stem the tide of leaks showing political bias at the tech giant.

Announcing the ejection of the alleged leaker, a Google employee wrote that vigilance about leaks was "especially important in light of the recent leaks that named our friends and colleagues in Breitbart and the

Daily Caller.

“If you have any knowledge of someone else who definitely leaked from THIS group, be sure to report it at go/stop-leaks,” wrote another Google software developer, referring to an internal messaging system for reporting potential leaks.

“I noticed a certain someone who leaked from this group still works here. Is that the new norm? Is there something specific that makes his leak okay? What’s up with all this?” wrote a different employee.

Another Google software engineer said that it would set “an incredibly bad precedent if he is not terminated in light of acknowledging responsibility for the leak.”

The “leak” in question was a [Medium post](#) by conservative Google software engineer Mike Wacker. In the post, the employee published anonymized messages from inside the company to draw attention to hostile working conditions faced by employees who express non-leftwing opinions at Google.

Leftists at Google are now also blaming Wacker for the [leak of messages from the transparency and ethics discussion group](#) about Kay Coles James, the conservative voice on Google’s now-canceled AI advisory council. In the messages, Google employee accused the African-American grandmother and president of the Heritage Foundation of being a “vocal bigot” who supported “exterminationist views.”

Some Google employees urged caution, noting that there was no evidence that Wacker leaked the discussion, and that persecuting him for his Medium post might have legal implications.

“The odds of them showing up in, for example, a lawsuit for discrimination, or unfair dismissal, are high,” said one employee, who warned against empowering “far-right extremists”.

“They serve the propaganda purpose of establishing further that Google is discriminatory against ‘conservative’ voices (ie: the far-right extremists, and the people perfectly happy to work with them if they don’t directly agree such as any republican voter) and that ‘leftists’ as a whole are a mob persecuting anyone they imagine might be an ‘enemy’ without regard of the facts.”

“It occurred to me that some amount of his conversation might be considered protected speech given that it’s talking about working conditions,” wrote another employee.

Under the National Labor Relations Act, workers can engage in public discussion of working conditions at their places of employment. In [recent cases](#), the National Labor Relations Board (NLRB) has upheld the right of employees to hold these discussions on social media platforms.

James Damore, who was fired from Google after publishing an internal memo advocating for viewpoint diversity which was subsequently leaked to the press by his opponents inside the company, brought a case before the NLRB after his dismissal. The NLRB, [lobbied by Google](#), ruled [in favor](#) of firing Damore for so-called “discriminatory statements,” but also said that much of the rest of his memo, which discussed working conditions at Google, was protected by labor law.

Nevertheless, a Google employee insisted that the company’s leadership was “looking into” what to do with Wacker, but warned that even though the purported leaker had been ejected from the group, members should still be cautious about further leaks.

“The same email list which leaked recently is probably not the appropriate forum in which to be discussing the matter of what is being done about the leakers.”

Breitbart News has reached out to Google for comment.

Google Makes It Hard to Find Trump's Biggest Online Fan Club The_Donald

By [Petr Svab](#)

If a person, by any chance, searched the words "Donald Trump" and "Reddit" together on a number of internet search engines, such as Yahoo, Bing, and DuckDuckGo, he or she would find that the top spot in the results is occupied by r/The_Donald—likely the largest and most active fan club for President Donald Trump on the internet.

Making the same search on Google, however, yielded no such result when repeatedly tried by The Epoch Times on April 12. Not on the first page of the results, not on the second, not on the 10th.

The phenomenon was noticed by a Reddit user QuenHen2219 within days [after the news broke](#) that special counsel Robert Mueller concluded his report finding no collusion between Trump's 2016 campaign and Russia.

"Now I can't definitively say this, but I noticed something weird," the user said [in a March 25 post](#). "When you would go to Google and search for 'Donald Trump reddit' r/the_Donald would always be the first search result. Now, after the Mueller report dropped, if you Google search the same term r/the_Donald isn't listed."

Other users concurred, reporting that Google returned the same result, or lack thereof, for them too.

The Epoch Times conducted a series of tests on March 25, March 26, and April 12 using multiple web browsers in public and private modes, logged in or not—with the same lack of r/The_Donald in the Google results for a plethora of phrases, like "Donald Trump Reddit" and "Reddit The Donald Trump" and even "Reddit The Donald."

Google search results for the words "donald trump reddit" as shown on March 25, 2019. (Screenshot via Google)

Other search engines consistently showed the page at the top of the results.

DuckDuckGo search results for the words "donald trump reddit" as shown on March 25, 2019.
(Screenshot via DuckDuckGo)

search results for the words "donald trump reddit" as shown on March 25, 2019. (Screenshot via Yahoo

Bing search results for the words "donald trump reddit" as shown on March 25, 2019. (Screenshot via Bing)

The Epoch Times wasn't able to confirm whether Google used to surface the page for these search phrases in the past.

A Google official commenting on the condition of anonymity denied the company took any action to impact the ranking of the page and said Google didn't remove it from its page index. The page still appears high in the results, the official said via email, when one looks for it more specifically, such as by searching "The_Donald" or "r/The_Donald" or "reddit The_Donald."

The official didn't explain however, why is it only Google that makes The_Donald more difficult to find.

"Fringe Ranking"

One possible explanation came in an [April 9 report by The Daily Caller](#), which cited internal Google documents as saying that the company has something called "fringe ranking: not showing fake news, hate speech, conspiracy theories, or science/medical/history denial unless we're sure that's what the user wants."

Google didn't respond to questions on whether the "fringe ranking" applies to r/The_Donald. Left-leaning press has, however, repeatedly accused the page's users of being hateful.

The page was created in June 2015, less than two weeks after Trump announced his candidacy. It has since grown to more than 730,000 subscribers and has [commonly ranked as the third most active](#) subreddit in the Reddit list ranking tool.

Its content is, by definition, 100 percent supportive of the president and generally of conservatism. Its other focus is criticizing and ridiculing Trump's opponents, particularly leftist politicians, celebrities, and media. Its humor and commentary is at times insulting, inaccurate, and/or based on speculation.

Bias Accusations

Google and other tech companies including Facebook and Twitter have been consistently accused of bias against right-leaning content. The companies have denied political bias, but a growing stack of evidence shows they may have been applying their "hate speech" and other policies unevenly, perhaps without being aware of doing so.

"There's no intentional filtering of conservative perspectives, but many of the people in these roles [of content management] aren't aware of what non-left-leaning perspectives even are—they just aren't exposed to them," former Facebook senior engineer [Brian Amerige](#) previously told The Epoch Times via Facebook Messenger.

[The company itself acknowledged](#) that "there is no universally accepted answer for when something crosses the line of hate speech."

Despite that, one Facebook engineer even mused in a leaked communication that the company has to suppress "content near the perimeter of hate speech" too.

Journalist and commentator Tim Pool suggested having a "hate speech" policy reflect a left-leaning bias to begin with.

"I would be willing to bet that a conservative running a social network would not have a hate speech policy," [he said](#) during his March 5 interview on the Joe Rogan show with Twitter CEO Jack Dorsey and Vijaya Gadde, Twitter's global lead for legal, policy, and trust and safety.

Blacklist

Internal Google materials leaked to media have indicated the company [manually tweaks search results](#) on topics it deems "controversial" and maintains a blacklist for pages that violate its "misrepresentation" and "good neighbor" policies. Such pages then don't show in the News and other infoboxes on the search result pages, The Daily Caller reported.

The leaked materials appear to contradict Dec. 11 congressional testimony of Google CEO Sundar Pichai, who said the company doesn't "manually intervene on any particular search result."

Google doesn't appear to provide any public explanation of how a page ends up on its blacklist or how online publications like The American Spectator and Conservative Tribune reportedly ended up on it when there seems to be no indication either has broken [Google's content policies](#) for News Publishers.

"We do not manually determine the order of any search result, nor do our algorithms or policies attempt to make any judgment on the political leanings of a website," a Google spokesperson said in an emailed statement in response to the Daily Caller report.

Google Manipulates News and Information Access on Orders From Corrupt Politicians

Google blocks Catalan independence info app following Spanish court ruling

[Get short URL](#)

Screenshot from Google Play

The High Court in Catalonia has ordered US tech giant Google to remove an application which provided information on where and how to vote in Sunday's referendum on the region's independence from Spain.

The judge said that the "*On Votar 1-Oct*" application on the Google Play smartphone app store violated the ruling of Spain's Constitutional Court, which labelled the plebiscite illegal.

[Read more](#)

[Catalonia urges EU to mediate on independence, â secretly printsâ referendum ballots](#)

Google was also ordered to block any future applications developed by the gmail address "Onvotar1oct@gmail.com," which was behind the banned app.

The judge said the appearance of the app once again showed the "reluctant attitude" of the Catalan government to previous court rulings to block referendum websites.

"They mean to dodge said blockades with computer applications for mobile devices, which, like the web pages, only promote and facilitate the holding of the referendum on October 1," he said.

According to the [Spain Report](#), Google has followed the court order and blocked the app which is now inaccessible from the Spanish territory.

"We remove content from our platforms when we receive a court order or when it violates our terms and conditions," the company said.

The local authorities in Catalonia reiterated on Friday that the vote will go ahead as scheduled on Sunday, despite strong opposition from Madrid.

Spanish authorities have been actively working to prevent the vote as thousands of additional police were deployed to the region, with orders to take control of the voting booths.

Earlier this week, the organization managing the registration of domains ending in .cat was raided by the police.

[READ MORE: 'Repression ships': Catalonia dockworkers refuse to serve Madrid police vessels](#)

The .cat Foundation was forced to block websites with information about the referendum in accordance to a court warrant issued several days earlier.

According to the organization, the court order, which saw stipulated that four four .cat domains related to vote be shut, was â unprecedented and absolute [in] scope.â

Around 140 websites related to the Catalan referendum were taken down in September in accordance with the court orders.

â Critical moment for Spainâ s democracyâ : UN slams Madridâ s attempts to halt Catalan referendum

Spanish attempts to hinder the Catalanian independence referendum, scheduled for this Sunday, violate fundamental human rights, UN experts said, adding that Madrid *â cuts offâ public information â at a critical moment for Spainâ s democracy.â*

Read more

[Catalonia defies Madridâ s attempt to take over local police, as chief refuses to comply](#)

â Regardless of the lawfulness of the referendum, the Spanish authorities have a responsibility to respect those rights that are essential to democratic societies,â UN experts on human rights and the promotion of democratic order said in comments on Thursday.

The experts urged Madrid to ensure that their measures against the referendum *â do not interfere with the fundamental rights to freedom of expression, assembly and association, and public participation.â*

The UN was referring to the arrests earlier in September of top-ranking Catalanian officials, including Junior Economy Minister Josep Maria JovÃ©. The Civil Guard repeatedly conducted searches of the Catalanian government buildings, and the Catalan president Carlos Puigdemont denounced the *â totalitarian attitudeâ* shown by the Spanish state in arresting Catalan officials at that time.

The Spanish state prosecutor also ordered a criminal investigation of 712 Catalan mayors for co-operating with the process.

â The measures we are witnessing are worrying because they appear to violate fundamental individual rights, cutting off public information and the possibility of debate at a critical moment for Spainâ s democracy,â the UN experts said.

They also criticized Madridâ s decision to deploy some 4,000 police officers in Catalonia, with an order from the Government to *â act in case the illegal referendum takes placeâ* .

[**READ MORE: Clashes with police in Catalonia as authorities make arrests in referendum crackdown \(VIDEOS\)**](#)

â We are concerned that this order and the accompanying rhetoric may heighten tensions and social unrest,â the experts said. *â We urge all parties to exercise the utmost restraint and avoid violence of any kind to ensure peaceful protests in the coming days.â*

Catalonia is a region of some 7.5 million people in Spain's north-east, which has its own language and culture, perhaps strongest in its capital, Barcelona.

The previous, informal independence referendum held in the region in 2014 saw 80 percent of those who voted choose independence. Nevertheless, the result was ignored by Madrid as the ballot was ruled unconstitutional.

Google Must Be Destroyed

<https://archive.fo/0WRSN>

14th January 2018, 06:04 pm

Carthage must be destroyed. *Ceterum censeo Carthaginem delendam esse* often abbreviated to simply *Carthago delenda est*. So ended every speech by the Roman senator Cato the Elder in the years between the 2nd and 3rd Punic wars, the latter the final war that finally accomplished what Cato and others demanded. In the years of the Republic from about 400BC to 100BC Carthage was the only power to ever seriously threaten Rome's existence. In 216BC four years into the 2nd Punic War, the Carthaginian general Hannibal came within a hair's breadth of destroying Rome by wiping out Rome's legions at the Battle of Cannae. The Romans hung on and Hannibal lost his chance, but the Romans never forgot the desperation after that battle and statesmen like Cato saw Rome as never being able to rest easy as long as Carthage existed. Cato eventually got his way and during the 3rd Punic War the Romans razed the city of Carthage and sold the Carthaginians into slavery.

Fast forward 2,000 years into the future and we are faced with a different type of enemy, one that does not field armies or own navies yet poses an existential threat regardless. Companies like Google, Facebook and Amazon are amassing hundreds of billions of dollars in profit by brokering information and distorting reality. These modern companies are just as threatening to our freedom as Hannibal's elephants were to the Romans. Unless we recognize the existential threat we face and act soon our freedom will be lost forever.

Google Must Be Destroyed

Chances our you've done a search for an item you need, say a new pair of boots. Within minutes every website you visit presents ads for boots or related winter gear. By using a free search engine like Google you have handed Google another few data points about you. Google knows where you are (unless you are accessing through a VPN - something most people in the USA don't do), your likely age and sex (by the choice of boots), and your socio-economic bracket (the price range of the boots you searched for, where you searched for them e.g. Walmart.com vs Nordstrom.com). The data points from that one search are collected by Google and added to those from other searches you've done. After a few searches Google has a very good idea who you are, what your likes are, what you hate, and more. That *more* is starting to get noticed.

In a 2015 The Atlantic article [People's Deepest Darkest Google Searches Are Being Used Against Them](#), Adrienne LaFrance points out how using a simple Google search as a need fast cash can open up the user to potential fraud and financial misery. She writes, "Not only are lenders taking advantage of people in vulnerable financial situations, not only are lead generators sometimes skirting Google's ad policies and even violating state laws, but companies are sharing individual data in a way that puts consumers directly at risk. All this comes down to the widespread availability and longevity of personal data online." Google later banned these ads but not before investing heavily in a payday loan startup LendUp. A

test Google search finds ads still present although interspersed with articles from government regulators and consumer agencies warning about their dangers.

Former Secretary of Defense Donald Rumsfeld was pilloried at the time for the [following quote](#): “There are known knowns. These are things we know that we know. There are known unknowns. That is to say, there are things that we know we don’t know. But there are also unknown unknowns. There are things we don’t know we don’t know.” Those who work in the IT field recognize the genius of this quote. The first things you can fix. The second things you can prepare for. It’s the “unknown unknowns” that keep sysadmins and designers awake at night.

In short we don’t know what we don’t know, and by manipulating and censoring search results Google is in fact manipulating reality. In “[The New Censorship](#)” Robert Epstein examines the methods Google employs to censor voices it disagrees with such as manipulating the auto-complete results, altering images displayed in Google Maps, and demonetizing YouTube videos its employees find offensive. Epstein writes, “If a librarian were caught trashing all the liberal newspapers before people could read them, he or she might get in a heap of trouble. What happens when most of the librarians in the world have been replaced by a single company? Google is now the largest news aggregator in the world, tracking tens of thousands of news sources in [more than thirty languages](#) and recently adding thousands of small, [local news sources](#) to its inventory. It also selectively bans news sources as it pleases.”

But his biggest complaint is Google’s usage of a site blacklist which even competing search engines use. Epstein writes, “When Google’s search engine shows you a search result for a site it has quarantined, you see warnings such as, ‘The site ahead contains malware’ or ‘This site may harm your computer’ on the search result. That’s useful information if that website actually contains malware, either because the website was set up by bad guys or because a legitimate site was infected with malware by hackers. But [Google’s crawlers often make mistakes](#), blacklisting websites that have merely been ‘hijacked,’ which means the website itself isn’t dangerous but merely that accessing it through the search engine will forward you to a malicious site. My own website, <http://drrobertepstein.com>, was hijacked in this way in early 2012. Accessing the website directly wasn’t dangerous, but trying to access it through the Google search engine forwarded users to a malicious website in Nigeria. When this happens, Google not only warns you about the infected website on its search engine (which makes sense), it also blocks you from accessing the website directly through multiple browsers – even non-Google browsers.” Epstein found his hijacked website was blocked by other browsers because these browsers were using Google’s blacklist to censor their own results.

Not only was Google manipulating the Internet through its browser, but it was also manipulating the Internet through competing browsers as well through the shared information. Epstein writes, “You may disagree, but in my view Google’s blacklisting practices put the company into the role of thuggish internet cop – a role that was never authorized by any government, nonprofit organization or industry association. It is as if the biggest bully in town suddenly put on a badge and started patrolling, shuttering businesses as it pleased, while also secretly peeping into windows, taking photos and selling them to the highest bidder.”

Earlier this week Google was sued by two former employees for being fired for their conservative views. On [January 9, 2018 Bookworm Room](#) posted internal messages of Google management discussing the internal memo by James Damore questioning Google’s Diversity Hiring program. She writes, “The complaint explains that Buckley holds a high-ranking ‘SRE’ (Site Reliability Engineering) position. If you think he doesn’t have a say in content, I’m sure he and those who work with him will differ. By the way, proving as did Altman that it’s not just American academia that’s insane, Colm is an Irish Social Justice Warrior, hailing from Trinity College, Dublin.” Here’s one of Buckley’s messages:

James Damore's and David Gudeman's lawsuit isn't the only one Google is facing. In October [conservative radio talk show host Dennis Prager filed suit against Google](#) for the demonetizing of his YouTube videos collectively known as "Prager University."

The New Surveillance Age

Since 2016 Google has released a series of appliances that allow hands-free querying of the Internet. Collectively known as Google Home these devices incorporate microphones to listen for the command "Hey Google," followed by a question. The device then searches the internet and provides a spoken response. Apple was the first to come up with the spoken search/response application "Siri" on its iPhone in 2011, moving to stand-alone products known as "HomePod" in December 2017. In 2014 Amazon released the stand-alone speaker "Echo" using its Alexa search service. Although these devices are keen to emphasize their utility by using the term "speaker" or "smart speaker" to suggest the information is delivered to the user, they do not highlight these devices are always listening. The microphones in these devices are always on, although the software will only interact with the user when a key phrase such as "Alexa", "Hey Siri" or "Hey Google" is used. In effect people are allowing their conversations to be monitored 24/7 within their own homes.

Would you allow a CCTV camera to be installed within your own home and pointed at you and your family at all times of the day? Would you allow it if Google or Amazon promised to allow you to order an item with a wave of a hand? In effect we have traded our freedom for convenience without appreciating the consequences. A friend related before Christmas how her 11 year old daughter used one of these appliances in a clever way. "Hey Alexa," the girl said, "Tell me all the orders you've received over the past month." The device dutifully listed all Amazon purchases, telling her all the presents her parents had purchased for her from the shopping site. If an 11 year old can game the appliance for her own benefit, imagine the ease a hacker of government intelligence service will have when these devices are ubiquitous.

While Google and the other makers of these appliances have promised to protect privacy, they have shown themselves to be lousy stewards of it so far. It's true that we've had similar devices in our pockets for years. After all Siri's been around on iPhones since 2011 followed in 2012 by Google's "Google

Nowâ assistant on Android handsets. Just because we arenât aware of a danger doesnât make it non-existent. There is nothing stopping a determine hacker or government intelligence agency from activating a microphone on a phone or appliance and transmitting a conversation. How long will it be before a Federal indictment against a mob boss using such a tool? I donât worry about the usage of this tool against terrorists or mafia members. Iâm worried about the usage of the tool by Google or Amazon to add to their data points for directed advertising.

Imagine a situation where you are in your kitchen with your significant other and you suggest replacing your old counter top. Then you log in to your computer to start your search only to find Amazon advertisements and Google searches pushing counter tops already there. How did it know you were interested in counter tops before you started searching? Now imagine talking about Glocks, pressure cookers or abortion and the possibilities become much more sinister. How would you prove this was happening?

Of course the companies [claim they have safeguards in place](#) to protect your privacy. But laws have not caught up to this technology and without laws and punishments in place there is nothing to stop a company like Google changing its policy. History has shown that whenever the means are available a company will exploit them for profit unless the fear of discovery and punishment outweighs the potential for profit. [Ask Wells-Fargo](#).

Googleâs parent holding company Alphabet is now one of the largest companies on the planet. Google controls a staggering 90% of all searches and as shown by Dr. Epsteinâs discovery has a hand in controlling the remainder. If Google sold cars or electricity it would have long ago been broken up or regulated as a utility. So far it has avoided all attempts at federal control no doubt due to its [status as top lobbyist on Capitol Hill](#). While other companies like Amazon, Facebook and Twitter should also face anti-trust scrutiny â and Amazon is finally seeing some after its purchase of Whole Foods â Google stands out for the danger it presents to average Americans who rely upon it for its search engine, email and mapping applications. As a conservative Iâve tried to boycott Google for its treatment of Damore and blacklisting of conservative websites. Itâs not easy, and based on what Epstein found it may be pointless anyhow. **The only solution is lawfare.**

After the 3rd Punic War Rome was unchallenged in the Mediterranean for the next 500 years, and its golden age had begun. The threat by Google to our freedom is just as real as Carthage was to Catoâs Republic. It is time to end the dominance of Google for our own privacy and the future of a free Internet.

Google must be destroyed.

GOOGLE EXECUTIVES MISLED STAFF IN MEETING ON CHINA CENSORSHIP. HERE ARE 13 QUESTIONS THEY MUST ANSWER.

[Ryan Gallagher](#)

Photo: David Paul Morris/Bloomberg via Getty Images

GOOGLE BOSSES HAVE broken their silence on the company's plan to launch a censored search engine in China amid mounting internal protests over the project.

On Thursday, CEO Sundar Pichai admitted to employees during an all-hands meeting that the censorship project — code-named Dragonfly — had been — in an exploration stage for quite a while now, — according to two sources who heard his remarks. Pichai emphasized his belief that Google should return to China, but claimed that the company was — not close to launching a search product in China. — Facing [employee criticism](#) for shrouding Dragonfly in secrecy, Pichai vowed that — we — will definitely be transparent as we get closer to actually having a plan of record. —

Google co-founder Sergey Brin also spoke at Thursday's meeting — and remarkably stated that he knew nothing about Dragonfly until The Intercept [exposed](#) it earlier this month. Back in 2006, Google launched a censored search engine in China. But four years later, in March 2010, it pulled the service out of the country, [citing](#) Chinese government efforts to limit free speech, block websites, and hack Google's computer systems. At that time, Brin was a vocal opponent of the censorship. During Thursday's meeting, Brin told Google employees that Dragonfly would have — certain trade-offs — but said the process was — slow-going and complicated. —

Both Pichai and Brin's remarks to Google employees raise a number of questions. Pichai's attempt to portray Dragonfly as an — exploratory — project contradicts internal Google documents and statements issued by senior Google officials on Dragonfly that The Intercept has seen.

Google co-founder Sergey Brin also spoke at Thursday's meeting — and stated that he knew nothing about Dragonfly until The Intercept exposed it.

As recently as last month, Google's search engine chief Ben Gomes told Google staff who were working on Dragonfly that they should have it ready to be — brought off the shelf and quickly deployed. — The employees were told that the main barrier to launching Dragonfly was the ongoing trade war between the U.S. and China, which had slowed down negotiations with officials in Beijing, whose approval Google needed to launch the censored search platform. Several prototypes of the search tool — which would — blacklist sensitive queries — and be deployed as an app for Android devices — were shown to Chinese officials. Through the process, Pichai repeatedly traveled to China, meeting with top Communist Party officials, such as Wang Huning, one of President Xi Jinping's top advisers. Dragonfly was well beyond the — exploratory — stage.

Several human rights groups have called on Google to cancel Dragonfly, and a bipartisan group of six U.S. senators has [condemned it](#) as — deeply troubling. — Meanwhile, Google employees — most of whom knew nothing about the China plan until they read the news reports — [want an ombudsperson](#) to be appointed to review — urgent moral and ethical issues — raised by the censorship.

Publicly, Google has not yet issued a statement. Dozens of reporters have questioned Google about Dragonfly, but they have been told only that the company will not discuss â speculation about future plans.â After two weeks of sustained reporting on the issue, Google has not issued a single response to The Intercept.

HERE ARE A number of questions that Google should answer. The Intercept has sent these to the company and will post any responses here if and when we receive them.

- 1) Sundar Pichai told Google staff on Thursday that Dragonfly was â exploratory.â But employees working on Dragonfly were told last month to have the project in a â launch-ready stateâ and were awaiting approval from Beijing. Are you no longer seeking to imminently launch Dragonfly as soon as Communist Party officials give you the permission?
- 2) Given that relaunching Google search in China would have massive political and strategic implications for Google, why was co-founder Sergey Brin not told about the plan? Especially given his well-documented anti-censorship views? Was Dragonfly ever discussed at the board level of the company?
- 3) In 2010, Google pulled its search engine out of China, [citing](#) efforts to limit free speech, block websites, and hack Google computer systems as reasons why it â could no longer continue censoring our results.â Since 2010, according to analysts and human rights groups, internet censorship in China has become more pervasive. Can you explain why Google wants to now relaunch a censored version of its search engine in China? What has changed in the last eight years that has prompted this decision? Does Google leadership no longer have concerns about censorship in China, or the â forces of totalitarianismâ in the country that Brin [described](#) in 2010?
- 4) A bipartisan group of six U.S. senators has called Googleâ s censorship plans for China â [deeply troubling](#).â Human rights groups including [Amnesty International](#), [Human Rights Watch](#), [Access Now](#), [Reporters Without Borders](#), and [Human Rights in China](#) have each issued statements raising concerns about the project. Amnesty said: â It is impossible to see how such a move is compatible with Googleâ s â do the right thingâ motto, and we are calling on the company to change course.â What is Googleâ s response to this?
- 5) Before and during the planning and development of the censored search engine, did Google consult with any human rights experts familiar with the situation in China? If so, what did these experts advise and did Google accept their recommendations? Will Google publish any advice it received from China human rights experts? If Google did not consult any organizations specializing in Chinese human rights issues, why not?
- 6) Google is a member of the [Global Network Initiative](#), an organization that seeks to defend digital rights across the world. Companies that join the GNI â like Google â commit to implementing its [Principles on Freedom of Expression and Privacy](#). The principles appear to prohibit member companies from aiding the sort of broad censorship that is widespread in China, stating that they should â work to protect the freedom of expression rights of users when confronted with government demands, laws and regulations to suppress freedom of expression, remove content or otherwise limit access to communications, ideas and information in a manner inconsistent with internationally recognized laws and standards.â How is Dragonfly consistent with the GNIâ s principles?
- 7) The Association of Computing Machinery is the worldâ s largest organization for computing professionals. Many Google employees are ACM members. According to the ACMâ s [ethical code](#), goals of technology development should be â to contribute to society and to human well-beingâ and â promoting human rights and protecting each individualâ s right to autonomy.â The code also states that â computing professionals should take action to avoid creating systems or technologies that disenfranchise or oppress people.â Does Google believe that its censored search platform for China is consistent with the ACMâ s ethical code?

8) Earlier this year, there were [protests](#) inside Google over a project to help develop artificial intelligence for processing images from U.S. military drones. The protests caused Google to cancel the project and release a set of [artificial intelligence ethical principles](#). One of the principles was that Google should not help build or deploy technologies whose purpose contravenes widely accepted principles of international law and human rights. These ethical principles apply to Google's search system, because it incorporates artificial intelligence technology. Can Google therefore explain how its planned censored search engine in China does not contravene widely accepted principles of international law and human rights?

9) According to Google documents seen by The Intercept, the censored search engine will operate as part of a joint venture with another company, which will presumably be based out of China, because internet companies providing services in China are required by law to operate their servers and data centers in the country. Sources say Google will supply the third-party company with an application programming interface, or API, which will potentially allow it to add blacklisted words or phrases to the search engine without Google's approval. Is this correct? How will the relationship with the partner company work in practice, and how will Google have oversight of the phrases and websites and other information that is censored?

10) Who at Google approves particular websites or search terms to be censored? Is this a decision made by legal and policy teams, or can blacklists be created by programmers and engineers? Is there a single person with ultimate authority over this duty, or is control delegated to a particular department? Will Google publicly release, outside of China, the list of blacklisted websites and sensitive search queries that will be censored? If not, why?

[Join Our Newsletter](#)

[Original reporting. Fearless journalism. Delivered to you.](#)

[In min](#)

11) Google employees were told not to discuss the project with colleagues. Only a few hundred of the company's 88,000 staff knew about it. Why did Google feel the need to keep the project so secret inside the company?

12) Companies operating in China are required by law to turn over data to security agencies upon request. How will Google safeguard its Chinese users' data from the Communist Party regime, which routinely targets people including human rights activists and journalists who express criticism of its orthodoxies? How will Google ensure that information about people's search queries are not monitored by the Chinese state?

13) Google's stated [central mission](#) is to organize the world's information and make it universally accessible and useful. The company's informal motto is "don't be evil." Google has since its early years maintained a list of [10 things](#) that represent foundational values for the company. One of these values is: "You can make money without doing evil." Another is: "Democracy on the web works." Can Google explain how these values are consistent with its plan to launch a censored search engine in China, which will limit people's access to information about subjects such as human rights, democracy, and peaceful protest?

Top photo: Sundar Pichai, chief executive officer of Google Inc., speaks the company's Cloud Next '18 event in San Francisco, Calif., on July 24, 2018.

GOOGLE BOSSES HAVE broken their silence on the company's plan to launch a censored search engine in China amid mounting internal protests over the project.

On Thursday, CEO Sundar Pichai admitted to employees during an all-hands meeting that the censorship project — code-named Dragonfly — had been — in an exploration stage for quite a while now, — according to two sources who heard his remarks. Pichai emphasized his belief that Google should return to China, but claimed that the company was — not close to launching a search product in China. — Facing [employee criticism](#) for shrouding Dragonfly in secrecy, Pichai vowed that — we — will definitely be transparent as we get closer to actually having a plan of record. —

Google co-founder Sergey Brin also spoke at Thursday's meeting — and remarkably stated that he knew nothing about Dragonfly until The Intercept [exposed](#) it earlier this month. Back in 2006, Google launched a censored search engine in China. But four years later, in March 2010, it pulled the service out of the country, [citing](#) Chinese government efforts to limit free speech, block websites, and hack Google's computer systems. At that time, Brin was a vocal opponent of the censorship. During Thursday's meeting, Brin told Google employees that Dragonfly would have — certain trade-offs — but said the process was — slow-going and complicated. —

Both Pichai and Brin's remarks to Google employees raise a number of questions. Pichai's attempt to portray Dragonfly as an — exploratory — project contradicts internal Google documents and statements issued by senior Google officials on Dragonfly that The Intercept has seen.

Google co-founder Sergey Brin also spoke at Thursday's meeting — and stated that he knew nothing about Dragonfly until The Intercept exposed it.

As recently as last month, Google's search engine chief Ben Gomes told Google staff who were working on Dragonfly that they should have it ready to be — brought off the shelf and quickly deployed. — The employees were told that the main barrier to launching Dragonfly was the ongoing trade war between the U.S. and China, which had slowed down negotiations with officials in Beijing, whose approval Google needed to launch the censored search platform. Several prototypes of the search tool — which would — blacklist sensitive queries — and be deployed as an app for Android devices — were shown to Chinese officials. Through the process, Pichai repeatedly traveled to China, meeting with top Communist Party officials, such as Wang Huning, one of President Xi Jinping's top advisers. Dragonfly was well beyond the — exploratory — stage.

Several human rights groups have called on Google to cancel Dragonfly, and a bipartisan group of six U.S. senators has [condemned it](#) as — deeply troubling. — Meanwhile, Google employees — most of whom knew nothing about the China plan until they read the news reports — [want an ombudsperson](#) to be appointed to review — urgent moral and ethical issues — raised by the censorship.

Publicly, Google has not yet issued a statement. Dozens of reporters have questioned Google about Dragonfly, but they have been told only that the company will not discuss â speculation about future plans.â After two weeks of sustained reporting on the issue, Google has not issued a single response to The Intercept.

HERE ARE A number of questions that Google should answer. The Intercept has sent these to the company and will post any responses here if and when we receive them.

- 1) Sundar Pichai told Google staff on Thursday that Dragonfly was â exploratory.â But employees working on Dragonfly were told last month to have the project in a â launch-ready stateâ and were awaiting approval from Beijing. Are you no longer seeking to imminently launch Dragonfly as soon as Communist Party officials give you the permission?
- 2) Given that relaunching Google search in China would have massive political and strategic implications for Google, why was co-founder Sergey Brin not told about the plan? Especially given his well-documented anti-censorship views? Was Dragonfly ever discussed at the board level of the company?
- 3) In 2010, Google pulled its search engine out of China, [citing](#) efforts to limit free speech, block websites, and hack Google computer systems as reasons why it â could no longer continue censoring our results.â Since 2010, according to analysts and human rights groups, internet censorship in China has become more pervasive. Can you explain why Google wants to now relaunch a censored version of its search engine in China? What has changed in the last eight years that has prompted this decision? Does Google leadership no longer have concerns about censorship in China, or the â forces of totalitarianismâ in the country that Brin [described](#) in 2010?
- 4) A bipartisan group of six U.S. senators has called Googleâ s censorship plans for China â [deeply troubling](#).â Human rights groups including [Amnesty International](#), [Human Rights Watch](#), [Access Now](#), [Reporters Without Borders](#), and [Human Rights in China](#) have each issued statements raising concerns about the project. Amnesty said: â It is impossible to see how such a move is compatible with Googleâ s â do the right thingâ motto, and we are calling on the company to change course.â What is Googleâ s response to this?
- 5) Before and during the planning and development of the censored search engine, did Google consult with any human rights experts familiar with the situation in China? If so, what did these experts advise and did Google accept their recommendations? Will Google publish any advice it received from China human rights experts? If Google did not consult any organizations specializing in Chinese human rights issues, why not?
- 6) Google is a member of the [Global Network Initiative](#), an organization that seeks to defend digital rights across the world. Companies that join the GNI â like Google â commit to implementing its [Principles on Freedom of Expression and Privacy](#). The principles appear to prohibit member companies from aiding the sort of broad censorship that is widespread in China, stating that they should â work to protect the freedom of expression rights of users when confronted with government demands, laws and regulations to suppress freedom of expression, remove content or otherwise limit access to communications, ideas and information in a manner inconsistent with internationally recognized laws and standards.â How is Dragonfly consistent with the GNIâ s principles?
- 7) The Association of Computing Machinery is the worldâ s largest organization for computing professionals. Many Google employees are ACM members. According to the ACMâ s [ethical code](#), goals of technology development should be â to contribute to society and to human well-beingâ and â promoting human rights and protecting each individualâ s right to autonomy.â The code also states that â computing professionals should take action to avoid creating systems or technologies that disenfranchise or oppress people.â Does Google believe that its censored search platform for China is consistent with the ACMâ s ethical code?

8) Earlier this year, there were [protests](#) inside Google over a project to help develop artificial intelligence for processing images from U.S. military drones. The protests caused Google to cancel the project and release a set of [artificial intelligence ethical principles](#). One of the principles was that Google should not help build or deploy technologies whose purpose contravenes widely accepted principles of international law and human rights. These ethical principles apply to Google's search system, because it incorporates artificial intelligence technology. Can Google therefore explain how its planned censored search engine in China does not contravene widely accepted principles of international law and human rights?

9) According to Google documents seen by The Intercept, the censored search engine will operate as part of a joint venture with another company, which will presumably be based out of China, because internet companies providing services in China are required by law to operate their servers and data centers in the country. Sources say Google will supply the third-party company with an application programming interface, or API, which will potentially allow it to add blacklisted words or phrases to the search engine without Google's approval. Is this correct? How will the relationship with the partner company work in practice, and how will Google have oversight of the phrases and websites and other information that is censored?

10) Who at Google approves particular websites or search terms to be censored? Is this a decision made by legal and policy teams, or can blacklists be created by programmers and engineers? Is there a single person with ultimate authority over this duty, or is control delegated to a particular department? Will Google publicly release, outside of China, the list of blacklisted websites and sensitive search queries that will be censored? If not, why?

[Join Our Newsletter](#)

[Original reporting. Fearless journalism. Delivered to you.](#)

[Learn more](#)

11) Google employees were told not to discuss the project with colleagues. Only a few hundred of the company's 88,000 staff knew about it. Why did Google feel the need to keep the project so secret inside the company?

12) Companies operating in China are required by law to turn over data to security agencies upon request. How will Google safeguard its Chinese users' data from the Communist Party regime, which routinely targets people including human rights activists and journalists who express criticism of its orthodoxies? How will Google ensure that information about people's search queries are not monitored by the Chinese state?

13) Google's stated [central mission](#) is to organize the world's information and make it universally accessible and useful. The company's informal motto is "don't be evil." Google has since its early years maintained a list of [10 things](#) that represent foundational values for the company. One of these values is: "You can make money without doing evil." Another is: "Democracy on the web works." Can Google explain how these values are consistent with its plan to launch a censored search engine in China, which will limit people's access to information about subjects such as human rights, democracy, and peaceful protest?

Top photo: Sundar Pichai, chief executive officer of Google Inc., speaks the company's Cloud Next '18 event in San Francisco, Calif., on July 24, 2018.

Tricks Naive Young Millennial Rainbow Hair Kids Into Helping

The Google Cult Rig Politics

Google is a Jewish â Cultâ . Period!

The executives and investors at Google are as delusional as the stupid children that Google hires to SJW to entire planet!

The term cult usually refers to a [social group](#) defined by its [religious](#), [spiritual](#), or [philosophical](#) beliefs, or its [common interest](#) in a particular personality, object or [goal](#). The term itself is controversial and it has divergent definitions in both [popular culture](#) and [academia](#) and it also has been an ongoing source of contention among scholars across several fields of study.[\[1\]\[2\]](#) In the [sociological classifications of religious movements](#), a cult is a social group with [socially deviant](#) or [novel](#) beliefs and practices,[\[3\]](#) although this is often unclear.[\[4\]\[5\]\[6\]](#) Other researchers present a less-organized picture of cults on the basis that cults arise spontaneously around novel beliefs and practices.[\[7\]](#) The word "cult" has always been controversial because it is (in a [pejorative](#) sense) considered a subjective term, used as an [ad hominem](#) attack against groups with differing doctrines or practices.[\[8\]\[9\]](#) Groups said to be cults range in size from local groups with a few members to international organizations with millions.[\[10\]](#)

Beginning in the 1930s, cults became the object of [sociological study](#) in the context of the study of religious behavior.[\[11\]](#) From the 1940s the [Christian countercult movement](#) has opposed some [sects](#) and [new religious movements](#), and it labelled them as cults for their "un-Christian" [unorthodox beliefs](#). The secular [anti-cult movement](#) began in the 1970s and it opposed certain groups, often charging them with [mind control](#) and partly motivated in reaction to acts of violence committed by some of their members. Some of the claims and actions of the anti-cult movements have been disputed by scholars and by the news media, leading to further public controversy.

The term "new religious movement" refers to religions which have appeared since the mid-1800s. Many, but not all of them, have been considered cults. Sub-categories of cults include: [Doomsday cults](#), [political](#) cults, destructive cults, [racist](#) cults, [polygamist](#) cults, and [terrorist](#) cults. Governmental reactions to cult-related issues have also been

a source of controversy.

Terminological history

Further information: [Cult \(religious practice\)](#), [Sociological classifications of religious movements](#), [Holiness movement](#), [Faith healing](#), [Anti-cult movement](#), and [ritual abuse panic](#)

[Howard P. Becker](#)'s church-sect typology, based on [Ernst Troeltsch](#)'s original theory and providing the basis for the modern concepts of cults, sects, and new religious movements

English-speakers originally used the word "cult" not to describe a group of religionists, but to refer to the act of [worship](#) or to a religious ceremony. The English term originated in the early 17th century, borrowed via the [French](#) *culte*, from [Latin](#) *cultus* (worship). The French word, in turn, derived from the Latin adjective *cultus* (inhabited, cultivated, worshiped), based on the verb *colere* (to care, to cultivate).^[12] The word "culture" also derives from the Latin words *cultura* and *cultus*; "culture" in general terms refers to the customary beliefs, social forms and material traits of a religious or social group.^[13]

While the literal original sense of the word in English remains in use, a derived sense of "excessive devotion" arose in the 19th century. The terms *cult* and *cultist* came into use in [medical literature](#) in the United States in the 1930s for what would now be termed "[faith healing](#)", especially as practised in the US [Holiness movement](#). This usage experienced a surge of popularity at the time, and extended to other forms of [alternative medicine](#) as well.^[14] In the English-speaking world the word "cult" often carries derogatory connotations.^[15]

Most sociologists and scholars of religion began to reject the word "cult" altogether because of its negative connotations in mass culture.^[16] Some began to advocate the use of new terms like "new religious movement", "alternative religion" or "novel religion" to describe most of the groups that had come to be referred to as "cults",^[17] yet none of these terms have had much success in popular culture or in the media. Other scholars have pushed to redeem the word "cult" as one fit for neutral academic discourse.^[18]

New religious movements

Main article: [New religious movement](#)

A new religious movement (NRM) is a religious community or spiritual group of modern origins (since the mid-1800s), which has a peripheral place within its society's dominant religious culture. NRMs can be novel in origin or part of a wider religion, in which case they are distinct from pre-existing [denominations](#).^{[19][20]} Scholars have estimated that NRMs, of which some but not all have been labelled as cults, number in the tens of thousands worldwide, most of which originated in Asia or Africa. The great majority have only a few members, some have thousands and only very few have more than a million.^[10] In 2007, religious scholar Elijah Siegler commented that, although no NRM had become the dominant faith in any country, many of the concepts which they had first introduced (often referred to as "[New Age](#)" ideas) have become part of worldwide mainstream culture.^[21]

Scholarly studies

[Max Weber](#) (1864–1920), one of the first scholars to study cults.

Sociologist [Max Weber](#) (1864–1920) found that cults based on [charismatic](#) leadership often follow the [routinization of charisma](#).^[22]

The concept of a "cult" as a [sociological classification](#) was introduced in 1932 by American sociologist [Howard P. Becker](#) as an expansion of German theologian [Ernst Troeltsch](#)'s [church-sect typology](#). Troeltsch's aim was to distinguish between three main types of religious behavior: churchly, [sectarian](#) and [mystical](#). Becker created four categories out of Troeltsch's first two by splitting *church* into "[ecclesia](#)" and "[denomination](#)", and *sect* into "[sect](#)" and "cult".^[23] Like Troeltsch's "mystical religion", Becker's cults were small religious groups lacking in organization and emphasizing the private nature of personal beliefs.^[24] Later sociological formulations built on these characteristics, placing an additional emphasis on cults as [deviant](#) religious groups "deriving their inspiration from outside of the predominant religious culture".^[25] This is often thought to lead to a high degree of tension between the

group and the more mainstream culture surrounding it, a characteristic shared with religious sects.[26] In this sociological terminology, *sects* are products of religious [schism](#) and therefore maintain a continuity with [traditional](#) beliefs and practices, while *cults* arise spontaneously around novel beliefs and practices.[27]

In the early 1960s, sociologist [John Lofland](#) lived with [South Korean missionary Young Oon Kim](#) and some of the first American [Unification Church](#) members in [California](#), during which he studied their activities in trying to promote their beliefs and win new members.[28] Lofland noted that most of their efforts were ineffective and that most of the people who joined did so because of personal relationships with other members, often family relationships.[29] Lofland published his findings in 1964 as a doctoral thesis entitled: "The World Savers: A Field Study of Cult Processes", and in 1966 in book form by [Prentice-Hall](#) as [Doomsday Cult: A Study of Conversion, Proselytization and Maintenance of Faith](#). It is considered to be one of the most important and widely cited studies of the process of religious conversion.[30][31]

Sociologist [Roy Wallis](#) (1945â1990) argued that a cult is characterized by "[epistemological](#) individualism", meaning that "the cult has no clear locus of final authority beyond the individual member". Cults, according to Wallis, are generally described as "oriented towards the problems of individuals, loosely structured, tolerant [and] non-exclusive", making "few demands on members", without possessing a "clear distinction between members and non-members", having "a rapid turnover of membership" and as being transient collectives with vague boundaries and fluctuating belief systems. Wallis asserts that cults emerge from the "cultic milieu".[32]

In 1978 Bruce Campbell noted that cults are associated with beliefs in a [divine element](#) in the [individual](#). It is either [Soul](#), [Self](#), or [True Self](#). Cults are inherently ephemeral and loosely organized. There is a major theme in many of the recent works that show the relationship between cults and [mysticism](#). Campbell brings two major types of cults to attention. One is mystical and the other is instrumental. This can divide the cults into being either [occult](#) or [metaphysical](#) assemblies. On the basis that Campbell proposes about cults, they are non-traditional religious groups based on belief in a divine element in the individual. There is also a third type. This is service-oriented. Campbell states that "the kinds of stable forms which evolve in the development of religious organization will bear a significant relationship to the content of the religious experience of the founder or founders." [33]

[Dick Anthony](#), a [forensic psychologist](#) known for his criticism of [brainwashing](#) theory of conversion,[34][35][36] has defended some so-called cults, and in 1988 argued that involvement in such movements may often have beneficial, rather than harmful effects, saying "There's a large research literature published in mainstream journals on the mental health effects of new religions. For the most part the effects seem to be positive in any way that's measurable." [37]

In their 1996 book *Theory of Religion*, American sociologists [Rodney Stark](#) and [William Sims Bainbridge](#) propose that the formation of cults can be explained through the [rational choice theory](#). [38] In *The Future of Religion* they comment "...in the beginning, all religions are obscure, tiny, deviant cult movements". [39] According to [Marc Galanter](#), Professor of Psychiatry at [NYU](#), [40] typical reasons why people join cults include a search for [community](#) and a [spiritual quest](#). Stark and Bainbridge, in discussing the process by which individuals join new religious groups, have even questioned the utility of the concept of *conversion*, suggesting that *affiliation* is a more

useful concept.[\[41\]](#)

Popular culture

Main article: [New religious movements and cults in popular culture](#)

Beginning in the 1700s authors in the English-speaking world began introducing members of cults as [antagonists](#). [Satanists](#), sects of the [Latter Day Saint movement](#), and [Thuggees](#) were popular choices. In the Twentieth century concern for the rights and feelings of religious minorities led authors to most often invent fictional cults for their villains to be members of.[\[42\]](#) Fictional cults continue to be popular in film, television, and gaming in the same way; while some popular works treat real cults and new religious movements in a serious manner.

Anti-cult movements

Christian countercult movement

Main article: [Christian countercult movement](#)

[Walter Martin](#) (1928â1989), American author and leading figure in the [Christian countercult movement](#).

In the 1940s, the long held opposition by some established Christian denominations to non-Christian religions and/or supposedly [heretical](#), or counterfeit, Christian sects crystallized into a more organized [Christian countercult movement](#) in the United States. For those belonging to the movement, all religious groups claiming to be Christian, but deemed outside of Christian [orthodoxy](#), were considered cults.[\[43\]](#) Christian cults are new religious movements which have a Christian background but are considered to be [theologically](#) deviant by members of other Christian churches.[\[44\]](#) In his influential book [The Kingdom of the Cults](#) (first published in the United States in 1965), Christian scholar [Walter Martin](#) defines Christian cults as groups that follow the personal interpretation of an individual, rather than the understanding of the [Bible](#) accepted by [mainstream Christianity](#). He mentions [The Church of Jesus Christ of Latter-day Saints](#), [Christian Science](#), [Jehovah's Witnesses](#), [Unitarian Universalism](#), and [Unity](#) as examples.[\[45\]](#)

The Christian countercult movement asserts that Christian sects whose beliefs are partially or wholly not in accordance with the [Bible](#) are erroneous. It also states that a

religious sect can be considered a cult if its beliefs involve a denial of what they view as any of the essential [Christian](#) teachings such as [salvation](#), the [Trinity](#), [Jesus](#) himself as a person, the [ministry of Jesus](#), the [miracles of Jesus](#), the [Crucifixion](#), the [Resurrection of Christ](#), the [Second Coming of Christ](#), and the [Rapture](#).[\[46\]\[47\]\[48\]](#)

Countercult literature usually expresses doctrinal or theological concerns and a [missionary](#) or [apologetic](#) purpose.[\[49\]](#) It presents a rebuttal by emphasizing the teachings of the [Bible](#) against the beliefs of non-fundamental Christian sects. Christian countercult activist writers also emphasize the need for Christians to [evangelize](#) to followers of cults.[\[50\]\[51\]\[52\]](#)

Secular anti-cult movement

Main article: [Anti-cult movement](#)

In the early 1970s, a secular opposition movement to groups considered cults had taken shape. The organizations that formed the secular "[anti-cult movement](#)" (ACM) often acted on behalf of relatives of "cult" [converts](#) who did not believe their loved ones could have altered their lives so drastically by their own free will. A few [psychologists](#) and sociologists working in this field suggested that [brainwashing](#) techniques were used to maintain the loyalty of cult members.[\[53\]](#) The belief that cults brainwashed their members became a unifying theme among cult critics and in the more extreme corners of the anti-cult movement techniques like the sometimes forceful "[deprogramming](#)" of cult members was practiced.[\[54\]](#)

Secular cult opponents belonging to the anti-cult movement usually define a "cult" as a group that tends to manipulate, exploit, and control its members. Specific factors in cult behavior are said to include manipulative and authoritarian [mind control](#) over members, [communal](#) and totalistic organization, aggressive [proselytizing](#), systematic programs of [indoctrination](#), and perpetuation in [middle-class](#) communities.[\[55\]\[56\]\[57\]\[58\]\[59\]\[60\]](#) In the mass media, and among average citizens, "cult" gained an increasingly negative connotation, becoming associated with things like [kidnapping](#), [brainwashing](#), [psychological abuse](#), [sexual abuse](#) and other [criminal activity](#), and [mass suicide](#). While most of these negative qualities usually have real documented precedents in the activities of a very small minority of new religious groups, mass culture often extends them to any religious group viewed as culturally deviant, however peaceful or law abiding it may be.[\[61\]\[62\]\[2\]\[63\]](#)

While some psychologists were receptive to these theories, sociologists were for the most part sceptical of their ability to explain conversion to [NRMs](#).[\[64\]](#) In the late 1980s, psychologists and sociologists started to abandon theories like brainwashing and [mind-control](#). While scholars may believe that various less dramatic [coercive](#) psychological mechanisms could influence group members, they came to see conversion to new religious movements principally as an act of a [rational choice](#).[\[65\]\[66\]](#)

Reactions to the anti-cult movements

Because of the increasingly pejorative use of the words "cult" and "cult leader" since the cult debate of the 1970s, some academics, in addition to groups referred to as cults, argue that these are words to be avoided.[\[67\]\[68\]](#) [Catherine Wessinger](#) ([Loyola University New Orleans](#)) has stated that the word "cult" represents just as much

prejudice and antagonism as racial slurs or derogatory words for women and homosexuals.[69] She has argued that it is important for people to become aware of the bigotry conveyed by the word, drawing attention to the way it dehumanises the group's members and their children.[69] Labeling a group as subhuman, she says, becomes a justification for violence against it.[69] She also says that labeling a group a "cult" makes people feel safe, because the "violence associated with religion is split off from conventional religions, projected onto others, and imagined to involve only aberrant groups".[69] This fails to take into account that child abuse, sexual abuse, financial extortion and warfare have also been committed by believers of mainstream religions, but the pejorative "cult" stereotype makes it easier to avoid confronting this uncomfortable fact.[69]

Sociologist Amy Ryan has argued for the need to differentiate those groups that may be dangerous from groups that are more benign.[70] Ryan notes the sharp differences between definition from cult opponents, who tend to focus on negative characteristics, and those of sociologists, who aim to create definitions that are value-free. The movements themselves may have different definitions of religion as well. [71] [George Chryssides](#) also cites a need to develop better definitions to allow for common ground in the debate. In *Defining Religion in American Law*, Bruce J. Casino presents the issue as crucial to international human rights laws. Limiting the definition of religion may interfere with freedom of religion, while too broad a definition may give some dangerous or abusive groups "a limitless excuse for avoiding all unwanted legal obligations".[72]

American Psychological Association report

Main article: [APA Task Force on Deceptive and Indirect Techniques of Persuasion and Control](#)

In 1983, [Margaret Singer](#), a leading anti-cultist who also had studied the political brainwashing of Korean prisoners of war,[73][74] was asked by the [American Psychological Association](#) (APA) to chair a [taskforce](#) called the [APA Task Force on Deceptive and Indirect Techniques of Persuasion and Control](#) (DIMPAC) to investigate whether brainwashing or "coercive persuasion" did indeed play a role in recruitment by cults. [75] It came to the following conclusion:[76]

Cults and large group awareness trainings have generated considerable controversy because of their widespread use of deceptive and indirect techniques of persuasion and control. These techniques can compromise individual freedom, and their use has resulted in serious harm to thousands of individuals and families. This report reviews the literature on this subject, proposes a new way of conceptualizing influence techniques, explores the ethical ramifications of deceptive and indirect techniques of persuasion and control, and makes recommendations addressing the problems described in the report.

On 11 May 1987, the APA's Board of Social and Ethical Responsibility for Psychology (BSERP) rejected the DIMPAC report because the report "lacks the scientific rigor and evenhanded critical approach necessary for APA imprimatur", and concluded that "after much consideration, BSERP does not believe that we have sufficient information available to guide us in taking a position on this issue." [77]

Subcategories

Destructive cults

[Jim Jones](#), the leader of the [People's Temple](#)

"Destructive cult" generally refers to groups whose members have, through deliberate action, physically injured or killed other members of their own group or other people. The [Ontario Consultants on Religious Tolerance](#) specifically limits the use of the term to religious groups that "have caused or are liable to cause loss of life among their membership or the general public".^[78] Psychologist [Michael Langone](#), executive director of the anti-cult group [International Cultic Studies Association](#), defines a destructive cult as "a highly manipulative group which exploits and sometimes physically and/or psychologically damages members and recruits".^[79]

[John Gordon Clark](#) cited [totalitarian](#) systems of governance and an emphasis on money making as characteristics of a destructive cult.^[80] In *Cults and the Family* the authors cite Shapiro, who defines a "destructive cultism" as a [sociopathic syndrome](#), whose distinctive qualities include: "behavioral and personality changes, loss of personal identity, cessation of scholastic activities, estrangement from family, disinterest in society and pronounced mental control and enslavement by cult leaders".^[81]

In the opinion of [Benjamin Zablocki](#), a Professor of Sociology at [Rutgers University](#), destructive cults are at high risk of becoming abusive to members. He states that this is in part due to members' adulation of [charismatic](#) leaders contributing to the leaders becoming corrupted by power.^[82] According to Barrett, the most common accusation made against destructive cults is [sexual abuse](#). According to [Kranenborg](#), some groups are risky when they advise their members not to use regular medical care.^[83] This may extend to physical and psychological harm.^[84]

Some researchers have criticized the usage of the term "destructive cult", writing that it is used to describe groups which are not necessarily harmful in nature to themselves or others. In his book *Understanding New Religious Movements*, John A. Saliba writes that the term is overgeneralized. Saliba sees the [Peoples Temple](#) as the "paradigm of a destructive cult", where those that use the term are implying that other groups will also commit [mass suicide](#).^[85]

Writing in the book [Misunderstanding Cults: Searching for Objectivity in a Controversial Field](#), contributor Julius H. Rubin complains that the term has been used to discredit certain groups in the [court of public opinion](#).^[1] In his work *Cults in Context* author Lorne L. Dawson writes that although the [Unification Church](#) "has not

been shown to be violent or volatile", it has been described as a destructive cult by "anticult crusaders".[86] In 2002, the German government was held by Germany's [Federal Constitutional Court](#) to have [defamed](#) the [Osho movement](#) by referring to it, among other things, as a "destructive cult" with no factual basis.[87][88]

Doomsday cults

Main article: [Doomsday cult](#)

Anti-[Aum Shinrikyo](#) protest in Japan

"Doomsday cult" is an expression which is used to describe groups that believe in [Apocalypticism](#) and [Millenarianism](#), and it can also be used to refer both to groups that predict [disaster](#), and to groups that attempt to bring it about.[89] A 1997 psychological study by Festinger, Riecken, and Schachter found that people turned to a cataclysmic [world view](#) after they had repeatedly failed to find meaning in mainstream movements.[90] [Leon Festinger](#) and his colleagues had observed members of a small [UFO religion](#) called the [Seekers](#) for several months, and recorded their conversations both prior to and after a failed prophecy from their charismatic leader.[91][92][93] Their work was later published in the book [When Prophecy Fails: A Social and Psychological Study of a Modern Group that Predicted the Destruction of the World](#). [94] In the late 1980s doomsday cults were a major topic of news reports, with some reporters and commentators considering them to be a serious threat to society.[95]

Political cults

[LaRouche Movement](#) members in [Stockholm](#) protesting against the [Treaty of Lisbon](#).

A political cult is a cult with a primary interest in [political action](#) and [ideology](#).^{[96][97]} Groups which some writers have termed "political cults", mostly advocating [far-left](#) or [far-right](#) agendas, have received some attention from journalists and scholars. In their 2000 book [On the Edge: Political Cults Right and Left](#), Dennis Tourish and [Tim Wohlforth](#) discuss about a dozen organizations in the [United States](#) and [Great Britain](#) that they characterize as cults.^[98] In a separate article Tourish says that in his usage:

The word cult is not a term of abuse, as this paper tries to explain. It is nothing more than a shorthand expression for a particular set of practices that have been observed in a variety of dysfunctional organisations.^[99]

The [LaRouche Movement](#)^[100] and [Gino Parente's National Labor Federation](#) (NATLFED)^[101] are examples of political groups that have been described as "cults", based in the United States; another is Marlene Dixon's now-defunct [Democratic Workers Party](#) (a critical history of the DWP is given in [Bounded Choice](#) by Janja A. Lalich, a sociologist and former DWP member).^[102]

The followers of [Ayn Rand](#) were characterized as a "cult" by economist [Murray N. Rothbard](#) during her lifetime, and later by [Michael Shermer](#).^{[103][104]} The core group around Rand was called the "Collective" and is now defunct (the chief group disseminating Rand's ideas today is the [Ayn Rand Institute](#)). Although the Collective advocated an individualist philosophy, Rothbard claimed they were organized in the manner of a "Leninist" organization.^[103]

In [Britain](#), the [Workers Revolutionary Party](#), a [Trotskyist](#) group led by the late [Gerry Healy](#) and strongly supported by actress [Vanessa Redgrave](#), has been described by others, who have been involved in the Trotskyist movement, as having been a cult or as displaying cult-like characteristics in the 1970s and 1980s.^[105] It is also described as such by Tourish and Wohlforth in their writings.^[106] In his review of Tourish and Wohlforth's book, Bob Pitt, a former member of the WRP concedes that it had a "cult-like character" but argues that rather than being typical of the far left, this feature actually made the WRP atypical and "led to its being treated as a pariah within the revolutionary left itself".^[107] [Workers' Struggle](#) (LO, *Lutte ouvri re*) in France, publicly headed by [Arlette Laguiller](#) but revealed in the 1990s to be directed by [Robert Barcia](#), has often been criticized as a cult, for example by [Daniel Cohn-Bendit](#) and his older brother Gabriel Cohn-Bendit, as well as [L'Humanit ](#) and [Lib ration](#).^[108]

In his book *Les Sectes Politiques: 1965  1995* (translation: *Political cults: 1965  1995*), French writer Cyril Le Tallec considered some religious groups as cults involved in politics, including the [League for Catholic Counter-Reformation](#), the [Cultural Office of Cluny](#), [New Acropolis](#), [S ka Gakkai](#), the [Divine Light Mission](#), [Tradition Family Property \(TFP\)](#), Longo-Mai, the Supermen Club and the Association for Promotion of the Industrial Arts (Solazaref).^[109]

In 1990 Lucy Patrick commented: "Although we live in a democracy, cult behavior manifests itself in our unwillingness to question the judgment of our leaders, our tendency to devalue outsiders and to avoid dissent. We can overcome cult behavior, he says, by recognizing that we have dependency needs that are inappropriate for mature people, by increasing anti-authoritarian education, and by encouraging personal autonomy and the free exchange of ideas."^[110]

Polygamist cults

Cults that teach and practice [polygamy](#), marriage between more than two people, most often [polygyny](#), one man having multiple wives, have long been noted, although they are a minority. It has been estimated that there are around 50,000 members of polygamist cults in [North America](#).^[111] Often, polygamist cults are viewed negatively by both legal authorities and society, and this view sometimes includes negative perceptions of related mainstream denominations, because of their perceived links to possible [domestic violence](#) and [child abuse](#).^[112]

In 1890, the president of the [Church of Jesus Christ of Latter-Day Saints](#), [Wilford Woodruff](#), issued a public declaration (the [Manifesto](#)) announcing that the LDS Church had ceased performing new plural marriages. [Anti-Mormon sentiment](#) waned, as did opposition to statehood for [Utah](#). The [Smoot Hearings](#) in 1904, which documented that the LDS Church was still practicing polygamy spurred the church to issue a [Second Manifesto](#) again claiming that it had ceased performing new plural marriages. By 1910 the LDS Church [excommunicated](#) those who entered into or performed new plural marriages.^[113] Enforcement of the 1890 Manifesto caused various [splinter groups](#) to leave the LDS Church in order to continue the practice of plural marriage.^[114] The [Church of Jesus Christ Restored](#) is a small sect within the [Latter Day Saint movement](#) based in [Chatsworth, Ontario](#), Canada. It has been labeled a polygamous cult by the news media and has been the subject of criminal investigation by local authorities.^{[115][116][117]}

Racist cults

[Cross burning](#) by [Ku Klux Klan](#) members in 1915.

Sociologist and historian [Orlando Patterson](#) has described the [Ku Klux Klan](#), which arose in the [American South](#) after the [Civil War](#), as a heretical Christian cult, and he has described its persecution of [African Americans](#) and others as a form of [human sacrifice](#).^[118] Secret [Aryan](#) cults in Germany and Austria in the nineteenth and early twentieth centuries had a strong influence on the rise of [Nazism](#).^[119] Modern [Skinhead](#) groups in the United States tend to use the same recruitment techniques as destructive cults.^[120]

Terrorist cults

In the book *Jihad and Sacred Vengeance: Psychological Undercurrents of History*, [psychiatrist Peter A. Olsson](#) compares [Osama bin Laden](#) to certain cult leaders

including [Jim Jones](#), [David Koresh](#), [Shoko Asahara](#), [Marshall Applewhite](#), [Luc Jouret](#) and [Joseph Di Mambro](#), and he says that each of these individuals fit at least eight of the nine criteria for people with [narcissistic personality disorders](#).^[121] In the book *Seeking the Compassionate Life: The Moral Crisis for Psychotherapy and Society* authors Goldberg and Crespo also refer to Osama bin Laden as a "destructive cult leader".^[122]

At a 2002 meeting of the [American Psychological Association](#) (APA), anti-cultist [Steven Hassan](#) said that [Al-Qaida](#) fulfills the characteristics of a destructive cult. He added: "We need to apply what we know about destructive mind-control cults, and this should be a priority with the war on terrorism. We need to understand the psychological aspects of how people are recruited and indoctrinated so we can slow down recruitment. We need to help counsel former cult members and possibly use some of them in the war against terrorism."^[123]

In an article on [Al-Qaida](#) published in *The Times*, journalist [Mary Ann Sieghart](#) wrote that al-Qaida resembles a "classic cult", commenting: "Al-Qaida fits all the official definitions of a cult. It indoctrinates its members; it forms a closed, totalitarian society; it has a self-appointed, messianic and charismatic leader; and it believes that the ends justify the means."^[124]

The [Shining Path guerrilla](#) movement active in [Peru](#) in the 1980s and 1990s has variously been described as a "cult"^[125] and as an intense "cult of personality".^[126] The [Tamil Tigers](#) have also been qualified as such by French magazine *L'Express*^[127]

Members of the [People's Mujahedin of Iran](#) in France, June 2003

The [People's Mujahedin of Iran](#), a leftist guerrilla movement based in [Iraq](#), has controversially been described as a political cult and as a movement that is abusive towards its own members.^{[128][129][130][131]} Former Mujaheddin member and now author and academic Dr. Masoud Banisadr stated in a May 2005 speech in Spain: "If you ask me: are all cults a terrorist organisation? My answer is no, as there are many peaceful cults at present around the world and in the history of mankind. But if you ask me are all terrorist organisations some sort of cult, my answer is yes. Even if they start as [an] ordinary modern political party or organisation, to prepare and force their members to act without asking any moral questions and act selflessly for the cause of the group and ignore all the ethical, cultural, moral or religious codes of the society and humanity, those organisations have to change into a cult. Therefore to understand an extremist or a terrorist organisation one has to learn about a cult."^[132] In 2003, the group ordered some of its members to [set themselves on fire](#), two of whom died.^[133]

Regional developments

[Falun Gong](#) books symbolically destroyed by Chinese government

The application of the labels "cult" or "sect" to religious movements in government documents signifies the popular and negative use of the term "cult" in [English](#) and a functionally similar use of words translated as "sect" in several European languages.[\[134\]](#) Sociologists critical to this negative politicized use of the word "cult" argue that it may adversely impact the religious freedoms of group members.[\[135\]](#) At the height of the counter-cult movement and ritual abuse scare of the 1990s, some governments published [lists of cults](#).[\[136\]](#) While these documents utilize similar terminology they do not necessarily include the same groups nor is their assessment of these groups based on agreed criteria.[\[134\]](#) Other governments and world bodies also report on new religious movements but do not use these terms to describe the groups.[\[134\]](#) Since the 2000s, some governments have again distanced themselves from such classifications of religious movements.[\[137\]](#) While the official response to new religious groups has been mixed across the globe, some governments aligned more with the critics of these groups to the extent of distinguishing between "legitimate" religion and "dangerous", "unwanted" cults in [public policy](#).[\[53\]](#)[\[138\]](#)

China

For centuries, governments in China have categorized certain religions as *xiejiao* ([Chinese](#): 邪教; [pinyin](#): xiéjiào) sometimes translated as "evil cult" or as "heterodox teaching".[\[139\]](#) In imperial China, the classification of a religion as *xiejiao* did not necessarily mean that a religion's teachings were believed to be false or inauthentic, but rather, the label was applied to religious groups that were not authorized by the state, or that were seen as challenging the legitimacy of the state.[\[139\]](#) In modern China, the term *xiejiao* continues to be used to denote teachings that the government disapproves of, and these groups face suppression and punishment by authorities. Fourteen different groups in China have been listed by the ministry of public security as *xiejiao*.[\[140\]](#) In addition, in 1999, Chinese authorities denounced the [Falun Gong](#) spiritual practice as a heretical teaching, and they launched a campaign to eliminate it. According to [Amnesty International](#), the [persecution of Falun Gong](#) includes a multifaceted propaganda campaign,[\[141\]](#) a program of enforced ideological conversion and re-education, as well as a variety of extralegal coercive measures, such as arbitrary arrests, [forced labour](#), and physical

[torture](#), sometimes resulting in death.[\[142\]](#)

Russia

In 2008 the [Russian Interior Ministry](#) prepared a list of "extremist groups." At the top of the list were Islamic groups outside of "traditional Islam," which is supervised by the Russian government. Next listed were ["Pagan cults"](#).[\[143\]](#) In 2009 the [Russian Ministry of Justice](#) created a council which it named "Council of Experts Conducting State Religious Studies Expert Analysis." The new council listed 80 large sects which it considered potentially dangerous to Russian society, and mentioned that there were thousands of smaller ones. Large sects listed included: [The Church of Jesus Christ of Latter-day Saints](#), [Jehovah's Witnesses](#), and what were called "neo-Pentecostals."[\[144\]](#)

United States

In the 1970s, the scientific status of the ["brainwashing theory"](#) became a central topic in U.S. court cases where the theory was used to try to justify the use of the forceful [deprogramming](#) of cult members.[\[145\]\[135\]](#) Meanwhile, sociologists critical of these theories assisted advocates of [religious freedom](#) in defending the legitimacy of new religious movements in court.[\[53\]\[138\]](#) In the United States religious activities of cults are protected under the [First Amendment of the United States Constitution](#), which prohibits governmental [establishment of religion](#) and protects [freedom of religion](#), [freedom of speech](#), [freedom of the press](#), and [freedom of assembly](#). However, no religious or cult members are granted any special immunity from criminal charges.[\[146\]](#)

Western Europe

France and Belgium have taken policy positions which accept "brainwashing" theories uncritically, while other European nations, like Sweden and Italy, are cautious about brainwashing and have adopted more neutral responses to new religions.[\[147\]](#) Scholars have suggested that outrage following the mass murder/suicides perpetrated by the [Solar Temple](#)[\[53\]\[148\]](#) as well as the more latent [xenophobic](#) and [anti-American](#) attitudes have contributed significantly to European anti-cult positions.[\[149\]](#) In the 1980s clergymen and officials of the French government expressed concern that some [orders](#) and other groups within the [Roman Catholic Church](#) would be adversely affected by anti-cult laws then being considered.[\[150\]](#)

Google Reads Everything You Do And Reports You To The Government If You Do Any Illicit Deeds

Officers began looking into his online activity Feb. 14 when Google told them he possessed child pornography. Adobe Stock Photo

[David Struett](#)
[email](#)

A man from west suburban Aurora has been charged for a second time with possessing child pornography after Google tipped off authorities to his online activity.

Harry Joslin, 32, was arrested Friday and charged with six counts of various child pornography possession, including a count of violating his status as a registered sex offender, according to Aurora police. The arrest concluded a months-long investigation into Joslin.

Harry Joslin | Aurora Police

Officers began looking into Joslin's online activity Feb. 14 when Google told them he possessed child pornography, police said. Investigators obtained search warrants to help detail his online actions, including Joslin's communication on social media, email and his cellphone.

Authorities found that Joslin maintained several online accounts not listed in the Sex Offender Registry, as was required by law, police said. He used the accounts to communicate with people he believed were under 18 years old.

In 2014, Joslin was charged with 10 counts of having child pornography, according to the Illinois Attorney General's Office. He pleaded guilty and was sentenced to four years in prison.

Joslin was being held Sunday at Kane County Jail, where his bond was set to \$100,000, according to the Kane County Sheriff's Office. His next court date is May 11.

The romantic relationships within the walls of Google made ideal fodder for gossip columns and magazine profiles.

Co-founder Larry Page dated Google lieutenant Marissa Mayer in the company's early days, and co-founder Sergey Brin later drew attention for dating Amanda Rosenberg, a younger colleague. CEO Eric Schmidt dated publicist Marcy Simon when she did work for Google. The stories had sex, money and power against a backdrop of one of the world's largest tech empires. It was like something out of

Google Records You In Very Creepy Ways

PARANOID ANDROID

How Google is secretly recording YOU through your mobile, monitoring millions of conversations every day and storing the creepy audio files

You may have accidentally triggered the listening device - allowing it to record incriminating convos and steamy gossip

Exclusive

By Margi Murphy

DID you know that Google has been recording you without your knowledge?

The technology giant has effectively turned millions of its users' smartphones into listening devices that can capture intimate conversations - even when they aren't in the room.

Getty Images

If you own an Android phone, it's likely that you've used Google's Assistant, which is similar to Apple's Siri.

Google says it only turns on and begins recording when you utter the words "OK Google".

But a Sun investigation has found that the virtual assistant is a little hard of hearing.

In some cases, just saying "OK" in conversation prompted it to switch on your phone and record around 20 seconds of audio.

It regularly switches on the microphone as you go about your day-to-day activities, none the wiser.

Sun

Once Google is done recording, it uploads the audio files to its computer servers - often dubbed "the cloud".

These files are accessible from absolutely anywhere in the world - as long as you have an internet connection.

That means any device that is signed into your personal Gmail or Google account can access the library of your deepest, darkest secrets.

So if you're on a laptop right now and signed into Gmail - you could have a listen.

Getty Images

Recordings last around 10-20 seconds on average, and a text version of the conversation is saved.

The Silicon Valley giant states on its terms and conditions that it keeps these recordings for "improving speech recognition against all Google products that use your voice".

After the Sun Online presented examples of the voice recognition flaws to Google, a spokesman said: "We only process voice searches after the phone believes the hot word 'OK Google' is detected. Audio snippets are used by Google to improve the quality of speech recognition across Search."

It recently launched a [smart assistant, Google Home](#).

Mundane voice recordings from the general public will help its artificial intelligence that runs Google Home, by teaching it how humans naturally communicate.

In simple terms: it's a free language class for its software.

How to find out exactly what Google knows about you

First, you'll need to be signed into your Gmail or Google account.

Once you've done that, type "history.google.com/history" into your web browser.

You'll be taken to a hub which contains your entire digital footprint, so be careful, it could make for some grim reading.

This includes Maps searches and YouTube videos you've watched.

Click on "Activity Controls "on the left-hand side of the page.

Under "Web and App Activity", click "Manage Activity".

If Google's keeping tabs on you, there should be a stream of web pages and map searches that show up in chronological order.

You can randomly delete searches, or select all the searches to make them disappear.

But Google is, first and foremost, an advertising company and its largest product is a targeted advert service, which it sells to the biggest brands in the world.

Billions of annual web searches, location and email data allow it to target the population with specialised marketing - and there is no reason why it couldn't do the same with your voice data, too.

So, now for the important question: how can I listen to the sound files Google has from my life?

How can I listen back to the audio Google has recorded from my phone?

It's pretty easy.

Unlike [Apple, who does not publicise any of the voice data it stores through Siri](#), Google is pretty transparent - giving you full access to your audio.

First, you'll need to be signed into your Gmail or Google account.

Once you've done that, type "history.google.com/history" into your web browser.

You'll be taken to a hub which contains your entire digital footprint, so be careful, it could make for some grim reading.

Google

Google

Google

This includes Maps searches and YouTube videos you've watched.

Under the tab Voice and Audio Activity, you'll find a list of recordings in chronological order.

Before you start listening, you might want to plug your headphones in.

[GOOGLE TIPS How to unsend a message on Gmail - essential tips to reclaim those embarrassing email blunders](#)

You'll have to listen to the cringe-worthy sounds of you buying a pack of fags in the newsagent or making small talk at the bus stop.

But there might also be all lots of salacious gossip that you wouldn't want anybody else to hear.

You'll be shocked to hear what it's picked up, however.

The Sun Online discovered recordings from when the phone's owner was not in the room - and even revealed a romantic interlude between two mystery colleagues.

How do I switch it off?

It is possible to stop Google from storing so much info in the future.

Go back to "Activity controls" and under "Web & App activity" you should see a blue toggle.

You can switch this off, but be warned. Officially you have merely "paused" the recordings - so keep checking back on a regular basis to ensure that the terms and conditions don't change in the future and you aren't auto-enrolled when a new Android update comes along.

Apple iPhone users aren't any better off.

The tech giant also stores your voice recordings to improve its Siri assistant - but you aren't able to access them.

Apple says that the recordings are anonymised after 18 months, so nobody would be able to figure out who is speaking.

Google Redefines The Word "Fascism" to Smear Trump

Google Redefines The Word "Fascism" To Smear Conservatives, Protect Liberal Rioters
By Derek Hunter

Has Google, the world's most popular search engine, changed the definition of the word "fascism" to protect liberal mobs using violence to silence those who disagree with them politically? The evidence suggests they have.

You see it on signs at every protest or riot "liberals accuse President Donald Trump of being a fascist. The word's association with Adolf Hitler and its use now is no accident, it's meant to strike fear in people's hearts of tyranny.

Merriam-Webster defines the word "fascism" as "a political philosophy, movement, or regime (as that of the Fascisti) that exalts nation and often race above the individual and that stands for a centralized autocratic government headed by a dictatorial leader, severe economic and social regimentation, and forcible suppression of opposition." The secondary definition is "a tendency toward or actual exercise of strong autocratic or dictatorial control."

This definition reflects the fact that Nazis were, in fact, both fascists and of the political left. They were the "National Socialist German Workers Party," which favored a heavy-handed government in business and the personal lives of its citizens.

The authoritarian government of Nazi Germany not only oppressed opposing political views and used violence to enforce it, they supported a powerful central government which heaped social benefits on its

citizens. The second part of Nazism is the "socialist" part, which is very similar to what the modern American political left advocates. For all their bluster to the contrary, Hitler was a man of the extreme left, and so was fellow fascist and Axis Powers member Benito Mussolini.

But if you type the word into Google, the definition they provide is quite different.

The world's largest search engine pins fascism on the political right, not the left.

Google defines fascism as, "an authoritarian and nationalistic right-wing system of government and social organization." (emphasis added)

The secondary definition is, "(in general use) extreme right-wing, authoritarian, or intolerant views or practice."

That's a striking difference from how the word has been defined for decades.

Screen capture from Google

Political conservatives advocate for small, less intrusive government where power rests with the states and individuals, and the federal government lives within its Constitutional restraints. Progressive liberals advocate for just the opposite: a powerful central government with authority vested in a strong leader who has the ability to impose decrees from Washington on everything from health care to education.

Google curiously adds "right-wing" to its definition and omits the "severe economic and social regimentation, and forcible suppression of opposition" part.

By the traditional Merriam-Webster definition of "severe economic and social regimentation, and forcible suppression of opposition," the violent mobs protesting and rioting over President Trump's actions are the ones engaging in fascistic tactics.

The exact reason Google has changed the definition of fascism to reflect on the political right rather than the left is unknown. However, Google co-founder Sergey Brin, one of the world's richest men, has been a vocal critic of President Trump, an activist liberal, and has protested the President's executive order on immigration.

Many members of the mainstream media have unquestioningly adopted the new Google meaning without explaining why, leaving their audience with the impression that speech or advocacy contrary to liberal orthodoxy is fascistic when, by definition, it is not.

Google Redefines The Word "Fascism" to Smear Trump

Google Redefines The Word "Fascism" To Smear Conservatives, Protect Liberal Rioters
By Derek Hunter

Has Google, the world's most popular search engine, changed the definition of the word "fascism" to protect liberal mobs using violence to silence those who disagree with them politically? The evidence suggests they have.

You see it on signs at every protest or riot "liberals accuse President Donald Trump of being a fascist. The word's association with Adolf Hitler and its use now is no accident, it's meant to strike fear in people's hearts of tyranny.

Merriam-Webster defines the word "fascism" as "a political philosophy, movement, or regime (as that of the Fascisti) that exalts nation and often race above the individual and that stands for a centralized autocratic government headed by a dictatorial leader, severe economic and social regimentation,

and forcible suppression of opposition.â The secondary definition is â a tendency toward or actual exercise of strong autocratic or dictatorial control.â

This definition reflects the fact that Nazis were, in fact, both fascists and of the political left. They were the â National Socialist German Workers Party,â which favored a heavy-handed government in business and the personal lives of its citizens.

The authoritarian government of Nazi Germany not only oppressed opposing political views and used violence to enforce it, they supported a powerful central government which heaped social benefits on its citizens. The second part of Nazism is the â socialistâ part, which is very similar to what the modern American political left advocates. For all their bluster to the contrary, Hitler was a man of the extreme left, and so was fellow fascist and Axis Powers member Benito Mussolini.

But if you type the word into Google, the definition they provide is quite different.

The worldâs largest search engine pins fascism on the political right, not the left.

Google defines fascism as, â an authoritarian and nationalistic right-wing system of government and social organization.â (emphasis added)

The secondary definition is, â (in general use) extreme right-wing, authoritarian, or intolerant views or practice.â

Thatâs a striking difference from how the word has been defined for decades.

Screen capture from Google

Political conservatives advocate for small, less intrusive government where power rests with the states and individuals, and the federal government lives within its Constitutional restraints. Progressive liberals advocate for just the opposite: a powerful central government with authority vested in a strong leader who has the ability to impose decrees from Washington on everything from health care to education.

Google curiously adds â right-wingâ to its definition and omits the â severe economic and social regimentation, and forcible suppression of oppositionâ part.

By the traditional Merriam-Webster definition of â severe economic and social regimentation, and forcible suppression of opposition,â the violent mobs protesting and rioting over President Trumpâs actions are the ones engaging in fascistic tactics.

The exact reason Google has changed the definition of fascism to reflect on the political right rather than the left is unknown. However, Google co-founder Sergey Brin, one of the worldâs richest men, has been a vocal critic of President Trump, an activist liberal, and has protested the Presidentâs executive order on immigration.

Many members of the mainstream media have unquestioningly adopted the new Google meaning without explaining why, leaving their audience with the impression that speech or advocacy contrary to liberal orthodoxy is fascistic when, by definition, it is not.

Google Redefines The Word â Fascismâ to Smear Trump

Google Redefines The Word â Fascismâ To Smear Conservatives, Protect Liberal Rioters
By Derek Hunter

Has Google, the worldâs most popular search engine, changed the definition of the word â fascismâ to protect liberal mobs using violence to silence those who disagree with them politically? The evidence suggest they have.

You see it on signs at every protest or riot â liberals accuse President Donald Trump of being a fascist. The wordâs association with Adolf Hitler and its use now is no accident, itâs meant to strike fear in peopleâs hearts of tyranny.

Merriam-Webster defines the word âfascismâ as âa political philosophy, movement, or regime (as that of the Fascisti) that exalts nation and often race above the individual and that stands for a centralized autocratic government headed by a dictatorial leader, severe economic and social regimentation, and forcible suppression of opposition.â The secondary definition is âa tendency toward or actual exercise of strong autocratic or dictatorial control.â

This definition reflects the fact that Nazis were, in fact, both fascists and of the political left. They were the âNational Socialist German Workers Party,â which favored a heavy-handed government in business and the personal lives of its citizens.

The authoritarian government of Nazi Germany not only oppressed opposing political views and used violence to enforce it, they supported a powerful central government which heaped social benefits on its citizens. The second part of Nazism is the âsocialistâ part, which is very similar to what the modern American political left advocates. For all their bluster to the contrary, Hitler was a man of the extreme left, and so was fellow fascist and Axis Powers member Benito Mussolini.

But if you type the word into Google, the definition they provide is quite different.

The worldâs largest search engine pins fascism on the political right, not the left.

Google defines fascism as, âan authoritarian and nationalistic right-wing system of government and social organization.â (emphasis added)

The secondary definition is, â(in general use) extreme right-wing, authoritarian, or intolerant views or practice.â

By the traditional Merriam-Webster definition of "severe economic and social regimentation, and forcible suppression of opposition," the violent mobs protesting and rioting over President Trump's actions are the ones engaging in fascistic tactics.

The exact reason Google has changed the definition of fascism to reflect on the political right rather than the left is unknown. However, Google co-founder Sergey Brin, one of the world's richest men, has been a

vocal critic of President Trump, an activist liberal, and has protested the President's executive order on immigration.

Many members of the mainstream media have unquestioningly adopted the new Google meaning without explaining why, leaving their audience with the impression that speech or advocacy contrary to liberal orthodoxy is fascistic when, by definition, it is not.

Google Refuses To Assist U.S. Military, Bends Over For China's Communist Censors

Besides clearly showing the company is willing to put profit above doing what's right, their decision to censor their search engine in China is likely to threaten their bottom line in the long run.

By [Helen Raleigh](#)

AUGUST 6, 2018

Should Google change its famous motto "Don't be evil" to something like "Don't be evil when it's convenient, but it's okay to be evil when it means new markets and more profit"? The question is pertinent, because The Intercept has [reported](#) that Google plans to launch a censored version of its search engine in China in the next six to eight months, pending the approval of Chinese regulators.

China already has one of the world's worst records on internet freedom. The Chinese government has built a large army of censors to scrub the internet to their liking in real time. Under President Xi Jinping, the Chinese government has further tightened its control over its people's right to free expression. Chinese censors cast a very wide net of control. Whether it's *The Wall Street Journal* site or the image of [Winnie the Pooh](#), whether it's a serious topic or something funny — anything the government doesn't like, or any phrase or images even remotely associated to anything the government doesn't like, is either banned, blocked or simply disappears.

For example, after Liu Xiaobo, China's first Nobel Peace Prize laureate and a human rights warrior, passed away last year, news reports of his death and any searches for Liu's Chinese name or his English initials LXB were blocked. The term "RIP," a candle emoji and even a picture of an empty chair were banned on China's equivalent of Twitter. Chinese people who dare to challenge censorship are quickly [detained](#) by local police. This shows how far China is willing to go in censorship.

Increasingly, the Chinese government has extended its censorship and oppression of its people beyond China's borders. From Singapore to the U.S., the Chinese are increasingly [fearful](#) of criticizing Beijing.

Once upon a time, Google modeled itself as a champion for freedom of expression. According to the company's old [code of conduct](#), its famous motto "Don't be evil" is "about providing our users unbiased access to information, focusing on their needs and giving them the best products and services that we can."

Only eight years ago, Google shut down its search engine on mainland China, over the Chinese government's control of online freedom and an alleged intrusion into several Chinese human rights

activistsâ Gmail accounts. Back then, Googleâs actions won wide praise for its moral stand and for living up to its âDonât be evilâ motto. Brave Chinese took great risk to leave flowers and chocolates in front of Googleâs Beijing office.

But with 700 million active internet users, China is probably such a big market that Google figures that it canât afford to be out for too long. In order to get back into China, Google has been working on this censored Chinese search engine, code-name âDragonflyâ for more than a year. The search engine will blacklist websites and search terms on human rights, democracy, religion and any other issues deemed sensitive by the Chinese government. Google also developed Chinese version search engine apps that will â automatically identify and filter websites blocked by the Great Firewall,â and will â blacklist sensitive queries so that â no results will be shownâ at all when people enter certain words or phrases.â Such kowtowing to Beijing is a betrayal to millions of Chinese internet users.

The Intercept [reported](#) that Google has already presented these censored search engine apps to their Chinese overlords. The censored search engine project is not the first time Google has made an attempt to return to the Chinese market. Google established its artificial intelligence (AI) China Center in Beijing in 2017. The company introduced a mini-game powered by AI on WeChat, a popular messaging and social network platform of Tencent Holdings, a Chinese homegrown technology company.

Since Google and its subsidiary, YouTube, controls about a [90 percent](#) of market share of worldwide internet searches, the Chinese government is only too happy to have such a powerful technology company to help them manipulate information and enhance their oppression over Chinese people. There is no doubt China will use Google as an example to pressure other foreign companies to join its unholy alliance. Patrick Poon, a Hong Kong based member of Amnesty International, told the Intercept, â It will set a terrible precedent for many other companies who are still trying to do business in China while maintaining the principles of not succumbing to Chinaâs censorship.â

While Google has no problem bending its knee to authoritarians, it refuses to help the U.S. military. In early June, Google [announced](#) it wouldnât renew a contract to do artificial intelligence work for the U.S. military after some strong opposition from its employees. The kind of work Google does with the Pentagon involves â using machine learning and engineering talent to distinguish people and objects in drone videos.â Worrying that Googleâs AI work with the Pentagon may lead to development of lethal weapons, about 4,000 Google employees signed an open letter saying working with the U.S. military was putting usersâ trust at risk, as well as ignoring its â moral and ethical responsibility.â Googleâs senior management was also reportedly deeply conflicted about Googleâs work with the Pentagon.

Apparently, Google believes that helping the U.S. military is morally objectionable, but helping Chinese censors to restrict internet freedom and oppress over a billion people wonât put usersâ trust at risk and is totally moral. Google also seems unconcerned that [China is developing killer robots](#), such as autonomous combat drone swarms. In truth, what Google didnât publicize is that their virtue signaling in the U.S. comes at a cheap price â Googleâs contract with the Pentagon is [reported](#) to be worth less than \$10 million, which is nothing for a company that is worth close to \$800 billion.

Interestingly, Google quietly [removed](#) the âDonât be evilâ motto from its company code of conduct sometime in either April or May this year. Clearly, todayâs Google no longer holds itself up to the moral standard it once believed in. Itâs no longer a champion of freedom of expression. Itâs just another business that is comfortable being evil for the sake of its bottom line.

But, Google should have done some research on its own powerful search engine. The Chinese government has paid only lip service to protecting foreign companiesâ intellectual property rights. Its actions show that it follows a different playbook:

Step 1. Entice foreign companies to China with the allure of the size of a giant consumer market, while forcing foreign companies to share their intellectual properties with a selected few large Chinese companies (so called ânational teamâ) through ruinous laws and regulations.

For example, According to Harvard Business Review [analysis](#), â Since 2006 the Chinese government has been implementing new policies that seek to appropriate technology from foreign multinationals in several technology-based industries, such as air transportation, power generation, high-speed rail, information technology, and now possibly electric automobiles. These rules limit investment by foreign companies as well as their access to Chinaâs markets, stipulate a high degree of local content in equipment produced in the country, and force the transfer of proprietary technologies from foreign companies to their joint ventures with Chinaâs state-owned enterprises.â

In 2015, China passed a new cyber security law, which requires any telecom and internet companies operating in China to provide Chinese law enforcement with assistance such as decryption of user data when deemed necessary to fight against terrorism. Despite objections from U.S. and European trade groups, the law became effective Jan. 1, 2016.

Step 2. Punish foreign competitors to aid domestic companies. For example, Qualcomm, a U.S. technology company, had to pay the Chinese government \$975 million to settle an anti-monopoly charge in 2015. In addition to the fine, Qualcomm had to âagreeâ to offer its licenses to some of its cutting edge technology at a sharp discount to what it charges companies elsewhere.

Step 3. Replace foreign goods and services in key industries with homegrown products and services after the Chinese companies obtain the technical knowhow. China announced that it has built a supercomputer that performs five times faster than a comparable U.S. one, with 100 percent made-in-China processor chips. Xiâs â [Made in China 2025](#)â program, sets a goal to replace foreign technology in key strategic areas with homegrown ones by 2025.

If this is what you decide to do Google, no one will stop you. But please drop your pretense of any moral superiority. You are now very much in danger of becoming part of the evil, Google! But, beware. As many companies have come to learn, getting into bed with evil is often a bad choice. Google may just find this bargain is its undoing.

Google Relies on Sociopath Soros as an Expert in Good Censor Report

[Tweet 19](#)

By [Corinne Weaver](#) |

Google wants to cite only the best experts in their fields in order to justify its position. Who better than liberal billionaire George Soros?

In the Google presentation, âThe Good Censor,â leaked to Breitbart, the search media company cited 27 so-called âexpertsâ for different aspects of digital freedom and online censorship. Among those experts were George Soros, a ProPublica article, *New York Times* editorial board member Sarah Jeong, former New Republic editor Franklin Foer, and Slate writer April Glaser. (ProPublica is one of many [news entities](#) funded by Soros. His Open Society Foundation gave at least [\\$737,411](#) to the non-profit journalism group.)

Google quoted Soros in the section about transparency regarding global positions, writing: âUS-based IT monopolies are already tempted to compromise themselves in order to gain entrance to these vast and fast growing markets. The dictatorial leaders in these countries may be only too happy to collaborate with them since they want to improve their methods of control over their own populations and expand their power and influence in the United States and the rest of the world.â

Soros-funded [Propublica](#) was also quoted complaining that while white supremacists and racists were not censored on the internet, feminists and anti-fascists were. The irony in this article is astounding, given that conservatives have been censored online while the left has managed to get away with most statements without repercussions.

Former editor-in-chief of MIT Technology Review [Jason Pontin](#) was cited 9 times in the course of the document, more than anyone else. While Pontin claims to be a âfree speech maximalistâ on his Twitter bio, statements from him also reveal that he is virulently opposed to the GOP. One tweet stated, âVote. Vote the whole lot out in November. The Republican Party arenât principled conservatives at all: theyâre cynical nihilists, appealing to a television-maddened, aggrieved regional and ethnic base. Enough already. Enough.â

Jeong was also included as an expert. Sheâs a tech writer who wanted to â#CancelWhiteMenâ and was a controversial addition to the Times staff.

Google Researchers Achieve HD Domestic Spy Video Streaming at 10,000 Less Power So That Every Watch and Mini-Bug Can Watch You In HD

- Credit: Dennis Wise/University of Washington
This low-power, video-streaming prototype could be used in next-generation wearable cameras, as well as in many other internet-connected devices.

Researchers achieve HD video streaming at 10,000 times lower power

Wearable cameras such as Snap Spectacles promise to share videos of live concerts or surgeries instantaneously with the world. But because these cameras must use smaller batteries to stay lightweight and functional, these devices can't perform high-definition video streaming.

Now, engineers at the University of Washington have developed a new HD video streaming method that doesn't need to be plugged in. Their prototype skips the power-hungry parts and has something else, like a smartphone, process the video instead.

They do this using a technique called backscatter, through which a device can share information by reflecting signals that have been transmitted to it.

“The fundamental assumption people have made so far is that backscatter can be used only for low-data rate sensors such as temperature sensors,” said co-author [Shyam Gollakota](#), an associate professor in the UW’s Paul G. Allen School of Computer Science & Engineering. “This work breaks that assumption and shows that backscatter can indeed support even full HD video.”

The team [presented these findings](#) April 10 at the Advanced Computing Systems Association’s [Symposium on Networked Systems Design and Implementation](#).

In today’s streaming cameras, the camera first processes and compresses the video before it is transmitted via Wi-Fi. These processing and communication components eat a lot of power, especially with HD videos. As a result, a lightweight streaming camera that doesn’t need large batteries or a power source has been out of reach.

The UW team developed a new system that eliminates all of these components. Instead, the pixels in the camera are directly connected to the antenna, and it sends intensity values via backscatter to a nearby smartphone. The phone, which doesn’t have the same size and weight restrictions as a small streaming camera, can process the video instead.

For the video transmission, the system translates the pixel information from each frame into a series of pulses where the width of each pulse represents a pixel value. The time duration of the pulse is proportional to the brightness of the pixel.

“It’s sort of similar to how the cells in the brain communicate with each other,” said co-author [Joshua Smith](#), a professor in the Allen School and the UW Department of Electrical Engineering. “Neurons are either signaling or they’re not, so the information is encoded in the timing of their action potentials.”

The team tested their idea using a prototype that converted HD YouTube videos into raw pixel data. Then they fed the pixels into their backscatter system. Their design could stream 720p HD videos at 10 frames per second to a device up to 14 feet away.

“That’s like a camera recording a scene and sending the video to a device in the next room,” said co-author and computer science and engineering doctoral student [Mehrdad Hessar](#).

The group’s system uses 1,000 to 10,000 times less power than current streaming technology. But it still has a small battery that supports continuous operation. The next step is to make wireless video cameras that are completely battery-free, said Smith, who is the [Milton and Delia Zeitschel Professor for Entrepreneurial Excellence](#).

The team has also created a low-resolution, low-power security camera, which can stream at 13 frames per second. This falls in line with the range of functions the group predicts for this technology.

“There are many applications,” said co-author and recent UW electrical engineering alum [Saman Naderiparizi](#). “Right now home security cameras have to be plugged in all the time. But with our technology, we can effectively cut the cord for wireless streaming cameras.”

The group also envisions a world where these cameras are smart enough to only turn on when they are needed for their specific purpose, which could save even more energy.

Gollakota is excited the UW research team is at the forefront of the low-power video-streaming field and its impact on the industry.

"This video technology has the potential to transform the industry as we know it. Cameras are critical for a number of internet-connected applications, but so far they have been constrained by their power consumption," he said.

"Just imagine you go to a football game five years from now," Smith added. "There could be tiny HD cameras everywhere recording the action: stuck on players's helmets, everywhere across the stadium. And you don't have to ever worry about changing their batteries."

This technology has been licensed to [Jeeva Wireless](#), a Seattle-based startup founded by a team of UW researchers, including Gollakota, Smith and Vamsi Talla, a recent UW alum and co-author on this paper.

This research was funded by the National Science Foundation, the Alfred P. Sloan Foundation and Google Faculty Research Awards.

Google Rolls Out Orwellian Nightmare Technology To Spy On You In Your Home

by [Tyler Durden](#)

[Authored by Mac Slavo via SHTFplan.com.](#)

Google's new Nest Hub Max is a smart display unit that comes equipped with a 6.5-megapixel **facial recognition camera that identifies you and monitors all your actions** inside your own home.

And the Orwellian icing on the cake is that **it is not equipped with a physical shutter to forcibly prevent it from monitoring what's happening in your home.**

It's the first smart home product from Google to include a camera so you can make video calls. It looks like a tablet propped up on its side, and it works similarly to smart speakers, such as Amazon Echo.

The Nest Hub Max is essentially a smart speaker that lets you control connected smart home devices, and comes with a display and camera.

It's the first smart home product from Google to include a camera so you can make video calls. It looks like a tablet propped up on its side, and it works similarly to smart speakers, such as Amazon Echo.

The Nest Hub Max is essentially a smart speaker that lets you control connected smart home devices, and comes with a display and camera.

It's not too dissimilar from the Google Home Hub, which Google just rebranded as Nest Hub. The new device has a 10-inch HD screen. It looks like a tablet in landscape orientation that's propped up on a base. The base contains a speaker. At the top of the device are a camera and microphones. [The Daily Dot](#)

The device allows you to check in on what's happening in your home when you're out, and **because of its facial recognition capabilities, will detect when you enter the room and provide personalized information to you**, such as your day's appointments, the weather forecast, and so on, [reported Natural News](#). The camera also enables two-way video calls over Google Duo and comes loaded with the Google Assistant (which has been the focus of a huge number of privacy issues). While all these functions might sound super convenient and fun, the privacy issues raised by the camera and audio functionality cannot be overlooked.

There are concerns about Google's face recognition. The company has struggled to maintain a good reputation. They have proven to be biased toward Communism and authoritarian ideals, big government control over the population, and have even censored those who reject the force and violence inherent in those ideas. **Today the face features are only accessible by Google, but what happens when it begins letting other apps and services access your face and you are one of those anti-government dissenters?**

[Clearly, there are real reasons to be concerned](#) about Google's latest tech offering, and those who wish to protect their online privacy might do better to steer well clear of it.

Google SMART CITY found to simply be a domestic surveillance program

Ann Cavoukian, former Ontario privacy commissioner, resigns from Sidewalk Labs

By [Sean Oâ€™Shea](#) Consumer Reporter Global News

[Listen](#)

[Ontario's former privacy commissioner](#) has resigned from her consulting role at a company that is preparing to build a high-tech community at Toronto's waterfront, citing concerns that a privacy framework she developed is being overlooked.

Ann Cavoukian resigned from her role from Google sister company Sidewalk Labs on Friday to "make a strong statement," she told Global News.

"I felt I had no choice because I had been told by Sidewalk Labs that all of the data collected will be de-identified at source," she said.

But last Thursday, at a meeting, she said she found out that wasn't the case with the company, which invested \$40 million to develop technology for a downtown Toronto smart city project.

READ MORE: [Amazon is selling authoritarian surveillance tech to police, civil rights groups want it to stop](#)

"Sidewalk said while they would commit to doing it, the other parties involved in these new entities they've created—they couldn't make them do it," she said.

Last October, Waterfront Toronto announced it had chosen Sidewalk Labs to present a plan to design a high-tech neighbourhood for the Quayside development, which is along Toronto's eastern waterfront.

Since then, the proposed project has been mired in controversy.

Former Blackberry co-CEO Jim Balsillie called the project “a colonizing experiment in surveillance capitalism.”

READ MORE: [Proposed Toronto development from Google’s Sidewalk Labs sparks concerns over data](#)

Cavoukian is one of Canada’s foremost privacy experts and a proponent for ensuring the privacy rights of citizens.

“Your personal information, your privacy is critical. It is not just a fundamental human right. It forms the foundation of our freedom,” Cavoukian said.

At the meeting with Sidewalk Labs, Cavoukian said she realized she could no longer continue as a consultant with the project after hearing that third parties might have access to identifiable data collected in the proposed project. At that point, she balked.

“When I heard that, I said, ‘I’m sorry. I can’t support this. I have to resign because you committed to embedding privacy by design into every aspect of your operation,’” she said.

Sidewalk Labs released a statement that said it would play “a more limited role” in discussions about data governance, and that while it agrees to follow her framework, Sidewalk Labs cannot guarantee that other companies involved in the project would do so as well.

READ MORE: [Google’s Sidewalk Labs project in Toronto raises privacy, data concerns](#)

Cavoukian said she has since approached Waterfront Toronto directly and is hopeful that the body will insist that data collected is immediately de-identified, drastically lowering the possibility that it could be used without someone’s consent.

“We don’t want people worrying about where they’re coming and going. We certainly don’t want a city of surveillance. That’s not on.”

“With files from Canadian Press

Google Search Is Quietly Destroying Democracy

A series of incremental changes over the years has transformed the tool from an explorative search function to one that is ripe for deception.

Photo-illustration: Jacqui VanLiew; Getty Images

•

Google's aesthetic has always been rooted in a clean appearance—a homepage free of advertising and pop-up clutter, adorned only with a signature “doodle” decorating its name. Part of why many users love Google is its sleek designs and ability to return remarkably accurate results. Yet the simplicity of Google's homepage is deceptively static. Over time, the way that the corporation returns information [has shifted](#) ever so slightly. These incremental changes go largely unnoticed by the millions of users who rely on the search engine daily, but it has fundamentally changed the information seeking processes—and not necessarily for the better.

WIR

Francesca Tripodi is an Assistant Professor at the School of Information and Library Science and a Senior Researcher at the Center for Information Technology and Public Life at UNC-Chapel Hill. She is the author of [*The Propagandists' Playbook*](#).

When Google first launched, queries returned a simple list of hyperlinked websites. Slowly, that format changed. First Google launched AdWords, allowing businesses to buy space at the top and tailoring returns to maximize product placement. By the early 2000s it was correcting spelling, providing summaries of the news under the headlines, and anticipating our queries with autocomplete. In 2007 it started Universal Search, bringing together relevant information across formats (news, images, video). And in 2012 it introduced Knowledge Graph, providing a snapshot that sits separate from the returns, a source of knowledge that many of us have come to rely on exclusively when it comes to quick searches.

As [research has shown](#), much of these design changes now link back to Google properties, placing its products above competitors. Instead of showing just a series of blue links, its goal, [according to official SEC documents filed by](#) Alphabet, is to increasingly “provide direct answers.” By adding all of these features, Google—as well as competitors such as DuckDuckGo and Bing, which also summarize content—has effectively [changed the experience](#) from an explorative search environment to a platform designed around verification, replacing a process that enables learning and investigation with one that is more like a fact-checking service.

Google's latest desire to answer our questions for us, rather than requiring us to click on the returns and find the answers for ourselves, is not particularly problematic if what you're seeking is a straightforward fact like how many ounces make up a gallon. The problem is, many rely on search engines to seek out information about [more convoluted topics](#). And, as my research reveals, this shift can lead to incorrect returns that often disrupt democratic participation, confirm unsubstantiated claims, and are easily manipulatable by people looking to spread falsehoods.

For example, if one queried “When is the North Dakota caucus” during the 2020 presidential election, Google highlighted the wrong information, stating that it was on Saturday, March 28, 2020. In fact, the firehouse caucus took place on March 10, 2020—it was the Republican convention that took place on the

28th. Worse yet, when errors like this happen, there is no mechanism whereby users who notice discrepancies can flag it for informational review.

Google summaries can also mislead the public on issues of grave importance to sustaining our democracy. When Trump supporters stormed the Capitol on January 6, 2021, conservative politicians and pundits quickly tried to frame the rioters as “anti-Trumpers,” spreading lies that antifa (a loose organization of people who believe in active and aggressive opposition to far-right movements) was to blame for the violence. On the day of the attack, *The Washington Times* ran an article, titled “Facial Recognition Identifies Extremists Storming the Capitol,” supporting the claim, and this story was perpetuated on the House floor and on Twitter by elected officials.

Yet even though the FBI has found no evidence to back these claims, and *The Washington Times* ultimately issued a correction to the article, the disinformation is still widely accessible with a simple Google search. If one were to look up “Washington Times Antifa Evidence,” the top return (as of the time of this writing) is the original article with the headline “Facial Recognition Identifies Extremists Storming the Capitol.” Underneath, Google summarizes an inaccurate argument, highlighting that the ones identified as the extremists were antifa. Perpetuating these falsehoods has long-lasting effects, especially since those in my study described Google as a neutral purveyor of news and information. According to an April 2021 poll, more than 20 percent of Republican voters still blame antifa for the violence that transpired that day.

The trouble is, many users still rely on Google to fact-check information, and doing so might strengthen their belief in false claims. This is not only because Google sometimes delivers misleading or incorrect information, but also because people I spoke with for my research believed that Google’s top search returns were “more important,” “more relevant,” and “more accurate,” and they trusted Google more than the news—they considered it to be a more objective source. Many said the Knowledge Graph might be the only source they consult, but few realized how much Google has changed—that it is not the search engine it once was. In an effort to “do their own research,” people tend to search for something they saw on Facebook or other social media platforms, but because of the way content has been tagged and categorized, they are actually [falling into an information trap](#).

This leads to what I refer to in my book, [The Propagandists' Playbook](#), as the “IKEA effect of misinformation.” Business scholars have found that when consumers build their own merchandise, they value the product more than an already assembled item of similar quality—they feel more competent and therefore happier with their purchase. Conspiracy theorists and propagandists are drawing on the same strategy, providing a tangible, do-it-yourself quality to the information they provide. Independently conducting a search on a given topic makes audiences feel like they are engaging in an act of self-discovery when they are actually participating in a scavenger-hunt engineered by those spreading the lies.

To combat this, users must recalibrate their thinking on what Google is and how information is returned to

them, particularly as a heated midterm season approaches. Rather than assume that returns validate truth, we must apply the same scrutiny we've learned to have toward information on social media. Googling the exact same phrase that you see on Twitter will likely return the same information you saw on Twitter. Just because it's from a search engine doesn't make it more reliable. We must be mindful of the keywords we start with, but we should also take a bit more time to explore the information returned to us. Rather than rely on quick answers to tough questions, take the time to click on the links, do a bit of digging on who is doing the reporting, and read information from a [variety of sources](#). Then start the search again but from a different perspective, to see how slight shifts in syntax change your results.

After all, something we might not even think to consider could be just a click away.

Research: Google Search Manipulation Can Swing Nearly 80 Percent of Undecided Voters

Leon

Neal/Getty Images 24 Apr 2018 [5872](#)

By inserting negative search suggestions under the name of a candidate, search engines like Google can shift the opinions of undecided voters by up to 43.4 percent, according to new [research](#) by a team at the American Institute for Behavioral Research and Technology and reported exclusively by Breitbart News.

The lead author of the study, Dr. Robert Epstein, has previously conducted research into what he calls the Search Engine Manipulation Effect (SEME). This research [showed](#) that the manipulation of results pages in search engines can shift the voting preferences of undecideds by anywhere between 20 and 80 percent, depending on the demographic.

His latest research looks at how search engines can affect voters by suggesting negative or positive search terms when a political candidate's name is entered into the search bar. Dr. Epstein's research found that when negative search terms are suggested for a candidate, it can have a dramatic effect on voter opinion.

From the study:

The voting preferences of participants who saw no search suggestions shifted toward the favored candidate by 37.1%. The voting preferences of participants in the search suggestion groups who saw only positive search suggestions shifted similarly (35.6%). However, the voting preferences of participants who saw three positive search suggestions and one negative search suggestion barely shifted (1.8%); this occurred because the negative search suggestion attracted more than 40% of the clicks (negativity bias). In other words, *a single negative search suggestion can impact opinions dramatically*. Participants who were shown four negative suggestions (and no positives) shifted *away* from the candidate shown in the search bar (-43.4%).

The researchers conclude that by using this method of manipulation, search engines can shift a 50/50 split among people who are undecided on an issue to a 90/10 split without people's awareness and without leaving a paper trail for authorities to follow.

The conclusions are based on 16 months of experiments conducted with a total of 1,800 people from all 50 U.S. states. Participants in the study came from diverse ideological backgrounds, including liberal, conservative, and moderate. In order to control prior biases, participants were asked to judge political candidates that they were unfamiliar with.

Further on in the paper, the researchers reference allegations of search suggestion manipulation made against Google during the 2016 election, when the tech giant appeared to be suppressing negative search suggestions for Hillary Clinton while allowing negative suggestions for Donald Trump and Bernie Sanders to remain.

The research also notes discrepancies with Google's current search suggestions, particularly with regards to its commercial interests. For example, entering "Gmail" into the search bar in Google will instantly provide users with suggestions to click on search terms about other Google products like Gmail, Google Maps, Google Drive, and others.

The researchers also found a recurring pattern of major brands being favored in Google search suggestions if they were financially linked to Google. The top search suggestions for "Amazon" is Amazon, Google's top client on Google Adwords, the company's digital advertising service. The top search suggestion for "Target" is Target, Google's third-biggest advertising client.

According to the research summary, The same pattern occurs for other major advertisers on Google, among them Best Buy, Home Depot, Lowes, and Zillow.

The only companies that are shortchanged by this arrangement are those with names beginning with g.

Google Search Says Republican Women Are Enablers

Google Shifted \$23 Billion to Bermuda in 2017 as Part of Tax Avoidance Scheme

Documents filed at the Dutch Chamber of Commerce reveal that [Google moved \\$23 billion to tax haven Bermuda](#) in 2017 through a tax avoidance technique known as the "[Double Irish, Dutch Sandwich](#)," whereby profits are initially sent to one Irish company, then to a Dutch company, and finally to a second Irish company headquartered in a tax haven. Google says [they pay all of the taxes due and comply with the tax laws in every country they operate in](#).

Google employed an international tax evasion strategy known as "Double Irish, Dutch Sandwich" that legally allowed companies channel their profits through an Irish company than through a Dutch one, then to another Irish subsidiary based in a place with no income taxes like Bermuda. The Dutch subsidiary moved the company's royalties earned outside the U.S. to Google Ireland Holdings, an affiliate which is based in Bermuda, where companies pay no income tax. The move allows Google to avoid paying U.S. income taxes and European withholding taxes on funds.

Google Shuts Down Advertising Campaign of Toronto Mayoral Candidate Faith Goldy Just Before Election

“We’ve confirmed that your account is in violation of our Google Ads policies. Since this decision is final, the account will not be reinstated,” wrote Google to Goldy in an email. “Please avoid creating additional Google Ads accounts, as they will be subjected to the same suspension. Our support team will not be able to give you any more specifics on the suspension.”

Goldy, who ran a “Canada First” campaign for the mayoral election, publicly opposed illegal immigration, and [promised](#) to “launch a Special Research Desk on Islamic Extremism to monitor finances in and out of Toronto Islamic centres” should she be elected.

“Voting commenced Monday at 10am, we got the notice [of ad suspension] late on Saturday night,” declared Goldy to Breitbart Tech, adding that an appeal was impossible until Google’s offices opened again on Monday, the day of the election.

“Americans should pay attention because Google is pioneering tactics in Canada which will be used against patriots south of the border come 2020,” Goldy proclaimed. “Big tech is interfering with a democratic election based on political bias and that should be deeply troubling to every candidate and voter committed to democratic values.”

“Our campaign has endured attacks from the collusive corporate media above this instance of Google censorship,” she continued. “In two instances, our campaign purchased advertising spots from mainstream media organizations in Canada, and in both cases, after signing the contracts, our campaign had the contracts illegally terminated hours before our scheduled airtime while no reason was given as to why.”

Google, which [dominates](#) the online advertisement market along with Facebook and Amazon, reportedly [controls](#) 85 percent of online ad growth along with Facebook.

Google also reportedly [generates](#) as much ad revenue as the entire global print advertisement market.

Google Staff Accused

of Even More Sexual

Harassment

By

Mark Bergen and

Jeremy Kahn

- Female statistician writes of harassment by two researchers
- Google is said to suspend Steven Scott after allegations

Sexual harassment accusations have hit another corner of the tech industry, with allegations involving prominent artificial intelligence researchers, including one at Google, a leader in the field.

Data scientist Kristian Lum wrote in [a blog](#) this week that a man she called "S" grabbed her inappropriately at an industry conference in 2010 and said he took advantage of another woman she didn't identify on separate occasions. Two people who were told about the conduct from two alleged victims told Bloomberg the man is Steven Scott, a senior researcher at Google.

Lum also wrote that a well-respected academic touched her inappropriately on the leg at the same conference and later sent her innuendo-laced messages. The man was later identified as Bradley Carlin, an expert in biostatistics, by people familiar with the alleged conduct.

The allegations were widely discussed on social media, drawing supportive comments and similar stories from researchers in academia and leading tech companies, including Alphabet Inc.'s Google and Microsoft Corp. Eric Horvitz, a Microsoft research director, called Lum's post a "powerful and important report."

"I'd love to tell my side of the story, but I'm afraid you'll need to get it from press@google.com," Scott wrote in an email, referring to Google's public relations department.

"Google is investigating the matter," Gina Scigliano, a company spokeswoman, said.

Scott has been suspended from Google as of Friday, according to a person familiar with the matter.

Carlin, a professor at the University of Minnesota, referred questions to the school, which said it is aware of the accusations but declined to comment further.

The researchers involved are experts in Bayesian statistics, which underpins a powerful type of AI known as machine learning. The accusations have surfaced during a growing debate over the lack of diversity among machine learning researchers and whether computer scientists are paying enough attention to bias including gender and racial bias in the data sets they are using to train AI systems.

The allegations came to light after the [recent conference](#) on Neural Information Processing Systems (NIPS) in Long Beach, California. Some attendees complained that aspects of some parties held during the conference were inappropriate and potentially offensive to women. They also condemned a joke about sexual harassment made by Carlin, a member of an amateur band that performed at the NIPS closing night party.

Carlin, the band's keyboardist, joked about the sexual misconduct allegations that forced the resignation of U.S. Senator Al Franken. After several attendees complained on Twitter that making light of sexual

harassment was inappropriate, Carlin apologized on the band's Facebook page.

Lum, who was not at the conference, learned of the incident and then wrote in the blog that she was unsurprised to learn that a person involved in making the troubling comments is a well-respected academic who is widely known to behave inappropriately at conferences.

Without naming Carlin directly, Lum said the academic had touched her inappropriately on the leg during an informal presentation she gave at a Bayesian mathematics conference in 2010. He also commented on her dress, saying it was too sexy for such an academic talk. Over the ensuing years, she wrote, the person sent her several innuendo-laced or inappropriate private Facebook messages, including messages in which he discussed watching pornography.

"I would like to defend myself against her accusations, but the matter has already been referred to my university's EEO team, which I am told will be conducting a full investigation into the matter," Carlin wrote in an email to Bloomberg, referring to the University of Minnesota's Equal Employment Opportunity department. "So I have been instructed not to say anything more publicly pending the results of that investigation."

Evan Lapiska, a spokesman for the university, said the school is "aware of public accusations" involving Carlin but declined to comment further citing privacy protections.

Lum declined to comment. In her post, she detailed further incidents of alleged harassment at the same 2010 conference. The "worst offender," she wrote, was a researcher that she only identifies as "S." At the end of the conference, while she was swimming with other researchers, the person grabbed Lum without her consent and put his hands on my torso, hips, and thighs, according to the post. Other female mathematicians spoke similarly to Lum about S, Lum added. And she wrote that he had "taken advantage of a junior person" under the influence of alcohol.

She said that several years later at another conference, during a reception hosted by Google, she overheard the same person bragging to friends about banging smokin' hot chicks. When Lum gave him a castigating stare, he told Lum she was only jealous he hadn't been talking about her, according to the blog.

"I knew it would be even more difficult to get people to find S's behavior problematic since he is employed by a large tech company," she wrote.

The person in Lum's post is Scott, a director of statistics research at Google, according to two people familiar with the situation. Katherine Heller, an assistant professor at Duke University, recognized Scott in Lum's description and told Bloomberg that he had acted inappropriately with a former student of hers. Heller also said that several other female researchers had reached out to her with similar stories about other men in the field after Lum's blog post was published.

"There really is just a lot of sexual harassment of women in Bayesian statistics and machine learning," Heller said. Another person in the field said she had witnessed Scott's actions with women in the past, but asked not to be identified given the sensitivity of the topic.

"Thank you for having the courage to speak out about this terrible behavior," Jeff Dean, head of Google's Brain AI unit, tweeted to Lum. "This has no place in science, math, statistics, computing, or anywhere else." Dean was commenting generally and he didn't respond to an email asking about Scott.

Lum said that after she saw in October that "S" had been nominated as a candidate for the board of the International Society for Bayesian Analysis (ISBA), she brought concerns about his behavior to the organization's president and he was removed from the ballot.

Scott, who has been at Google since 2008, was a candidate for the board and is no longer on the ballot, according to ISBA's website and one person with knowledge of the organization who spoke to Bloomberg.

Kerrie Mengersen, ISBA's president, did not respond to questions about Scott. But she said in an email that she and ISBA's executive committee supported Lum coming forward with her account. "The Executive Committee takes any report of inappropriate behavior very seriously," she said. "We have a great Society and a proud record of including women as members and as leaders. However, like many societies, we have recognized that we need to do more."

Mengersen said the organization was in the process of establishing protocols for appropriate behavior and support mechanisms for members who have been harassed.

Google Staffers Share Stories of Systemic Retaliation And Organized Corporate Reprisal

Mark Bergen and Josh Eidelson © Bloomberg Google Inc. Campus As Company Aims At Privacy Law

Hundreds of Google staffers met on Friday and discussed what activists allege is a frequent consequence of criticizing the company: Retaliation. Two leaders of recent company protests said they've been mistreated by managers and collected similar stories from other workers at the world's largest internet company.

The claims of retaliation are the latest in a series of internal upheavals over issues ranging from the use of artificial intelligence for military purposes to executive misconduct and the rights of contract workers. Alphabet Inc.'s Google set the standard in Silicon Valley for employing and retaining scores of highly-trained computer scientists. But the recent troubles have hurt its reputation. Employees registered a decline of faith in Google's executives in recent internal surveys. Several software coders refused to work on a project for the Pentagon last year, spiking the contract, and some resigned in protest.

In November, several employees organized a company walkout over payouts to executives facing sexual assault allegations. Around that time, the activists gathered 350 accounts of employee concerns.

On Monday, two of those organizers, Meredith Whittaker and Claire Stapleton, wrote an email saying Google had punished them because of their activism. The two asked staffers to join them on Friday to discuss the company's alleged actions, and during the meeting they shared more than a dozen other stories of internal retribution that they had collected over the past week. Like many meetings at Google, participants could watch via a video live-stream and submit questions and comments.

High Stakes

"Now more than ever we need to reject retaliation, and reject the culture of fear and silence that retaliation creates," read an email from the event organizers, which Bloomberg News viewed. "The stakes are too high."

"We prohibit retaliation in the workplace and [publicly share](#) our very clear policy," a Google spokeswoman said in an emailed statement. "To make sure that no complaint raised goes unheard at Google, we give employees multiple channels to report concerns, including anonymously, and investigate all allegations of retaliation."

Whittaker is a researcher at Google specializing in artificial intelligence. She co-founded a research group, AI Now, that is affiliated with New York University. Whittaker wrote to her colleagues in an email that she was told she would have to "abandon my work on AI ethics."

Stapleton, who works in the marketing department at YouTube, alleged that she was informed she was being demoted and later told to take a medical leave she didn't need. After she retained a lawyer, Stapleton said, the company "walked back my demotion, at least on paper," but "the environment remains hostile and I consider quitting nearly every day."

Sick Leave

In the email, Stapleton said that she arranged a meeting with Google's human resources division after flagging changes to her job. She was told to go on sick leave. When she replied that she wasn't sick, Stapleton wrote, the HR director said: "We put people on it all the time."

On Friday, Whittaker and Stapleton shared additional information about their situations in an internal post to colleagues.

Whittaker said that her manager, whom she did not name, told her that her AI ethics work “was no longer a fit.” The manager said Google’s cloud division had plans to massively increase sales by “being everywhere Lockheed is,” according to Whittaker. That’s a reference to the defense company Lockheed Martin Corp. Google’s work with the U.S. military was the subject of employee protests last year. A Google spokeswoman declined to comment on the mention of the cloud business.

Whittaker tried to get transferred to another Google AI team, a move she said was supported by Jeff Dean, the company’s head of artificial intelligence. Soon after, Whittaker was involved with another protest: an employee petition against the appointment of Kay Coles James to an AI ethics counsel organized by Google. The company ended up [scrapping](#) the group.

Two weeks after the petition, Whittaker said she learned that her planned transfer had been canceled and that her role at Google would be changing. “Continuing my work at AI Now and my work in AI ethics was not on the table,” she wrote.

Oona King, Google’s director of diversity strategy, rejected at least one of the employee’s claims. “I can genuinely say when I’ve looked at the details of one of the cases, it isn’t as it appears here,” she wrote, according to a message viewed by Bloomberg News.

#NotOkGoogle

Executives at YouTube and Google Cloud sent messages to staffers earlier this week disputing the accounts of Stapleton and Whittaker, according to a person who had seen them.

Several current and former employees took to Twitter on Friday to register complaints using the hashtag #NotOkGoogle, a riff on the company’s virtual assistant product. “This is just the tip of the iceberg,” [wrote](#) Alex Hanna, a member of Google’s cloud division.

“I am grateful that I quit Google,” [wrote](#) Liz Fong-Jones, an engineer and outspoken critic who left the company earlier this year.

“This is a pattern, these are systemic issues, and we will change it only by speaking up and acting together,” Stapleton wrote in the email.

Google management publicly endorsed the employee walkout in the fall, giving the blessing for staff to vent frustration. But as dissent continued to rise inside Google, the company’s lawyers [urged](#) the U.S. government to give companies more leeway to reign in rebellious employees from organizing over workplace email.

NLRB Complaint

Google made that argument in an ongoing case before the National Labor Relations Board involving alleged retaliatory discipline against an employee. On Monday, a new complaint was filed with the agency accusing Google of retaliating against staff for discussing and protesting working conditions.

The filing alleges that within the last six months, one or more employees suffered transfer, demotion, or “other adverse action,” and that the company acted “in order to discourage employees from engaging in the type of collective action that is protected by U.S. federal law.”

The identity of the person who made the filing was redacted in the copy obtained by Bloomberg News via a Freedom of Information Act request. The matter has been assigned to the NLRB's regional office in New York.

(Updates with information on NLRB complaint at end.)

[Politics](#)

Google Stealthily Infuses Political Agenda Into Products to Prevent Conservative policy, Insiders, Documents Say

By [Petr Svab](#)

—

[Google](#) is surreptitiously pushing its political agenda onto its users through its products in an effort that one employee described as “preventing the next Trump situation.”

The company has cloaked its political agenda in the veneer of “fairness,” but in reality, it means promoting the company’s political worldview at the expense of others’. It also is raising voices of those aligned with its worldview at the expense of those that oppose it, or that just aren’t aligned with it enough, according to internal documents obtained and employees speaking out or being caught on hidden camera [by Project Veritas](#).

“They are a highly biased political machine that is bent on never letting somebody like Donald Trump come to power again,” said one Google employee, who wished to remain anonymous and spoke on camera with his likeness not shown and his voice disguised.

Google, the world’s largest internet company with some 100,000 employees and more than \$130 billion in annual revenue, has long been accused of channeling the politics of its mostly left-leaning workforce into its products, which the company has repeatedly denied.

The latest revelations, however, depict a company that has expended substantial effort in putting its thumb on the political scales after the 2016 election.

“Right after Donald Trump won the election in 2016, the company did a complete 180 in what they thought was important,” the insider said.

Blaming Trump’s success on “hate and misogyny and racism,” the company decided to “fix” it and went on to diverge from its previous values of “self-expression and giving everyone a voice,” he said.

“They’re like ‘! We need to start policing our users, because we don’t want to have an outcome like that, we don’t want to have an outcome like that to happen again.’”

A similar sentiment was expressed by Jen Gennai, head of Google’s Responsible Innovation, who was caught on hidden camera by a Project Veritas reporter several weeks ago.

“We all got screwed over in 2016, again it wasn’t just us, it was, the people got screwed over, the news media got screwed over, like, everybody got screwed over so we’ve rapidly been like, ‘What happened there and how do we prevent it from happening again?’” she said.

Gennai said that she used to work for Google’s Trust and Safety team and that the 2020 presidential election has been “top of mind” for the team. “They’ve been working on it since 2016, to make

sure weâre ready for 2020,â she said.

None of this has been disclosed by Google to its users, many of whom still consider it an objective source of information, the insider said.

â Fairnessâ

Google believes that by filtering, ranking, aggregating, or generating media through its products, its users are â programmedâ to certain worldviews, [an internal document](#) suggests.

As it turned out, however, these worldviews are not always those preferred by the company. For example, when one searches on Google for â CEOsâ the results would likely show a lot of pictures of men, because most CEOs are men. But that would be â algorithmic unfairnessâ according to [an internal document](#), because â it would reinforce a stereotype about the role of women in leadership positions.â

In some such cases, â it may be desirable to consider how we might help society reach a more fair and equitable state, via either product intervention or broader corporate responsibility efforts,â the document states.

[On paper](#), â algorithmic unfairnessâ was defined by the company as â unjust or prejudicial treatment that is related to sensitive characteristics such as race, income, sexual orientation, or gender, though algorithmic systems or algorithmically aided decision-making.â

Since every person shares in such characteristics, the definition could make one believe that Google is simply trying to make sure it treats everybody fairly. But Gennai made clear her job was to bring â fairnessâ only to certain people, based on whether they belong to a group Google deems sufficiently â marginalized.â

â My definition of fairness and [bias](#) specifically talks about historically marginalized communities. And thatâs who I care about. Communities who are in power and have traditionally been in power are not who Iâm solving fairness for,â she was recorded as saying.

â Re-biasâ

The insider described a Google initiative called â ML Fairness,â the â MLâ stands for machine learning. The existence and purpose of ML Fairness were confirmed by Google software engineer Gaurav Gite, who was recorded describing the initiative by a Project Veritas reporter.

It was set up to develop an artificial intelligence (AI) algorithm that would put in place Googleâs idea of â fairnessâ at scale.

Gennai appeared to confirm that Google is going even further, looking to its algorithms for a specific political outcome.

â Weâre also training our algorithms, like, if 2016 happened again, would we have, would the outcome be different?â she said.

Algorithms are â trainedâ by being fed with sufficient quantities of properly classified data. If, for example, the AI is provided enough cat images classified as â a cat,â the machine will eventually learn to recognize almost any cat image, even one it hasnât encountered before, as â a cat.â

But the insider said Google has been training its “fairness” algorithm to produce results that reflect the company’s political views instead.

“What they’re really saying about fairness is that they have to manipulate their search results so it gives them the political agenda that they want,” he said. “And so they have to re-bias their algorithms.”

In 2008, for instance, Google introduced the “search suggestions” function. Whenever one started to type into the Google search bar, an algorithm would draw upon signals such as the user’s previous searches, searches by users worldwide, sites in Google’s index, and ads in Google’s network to suggest search phrases that start with the text already typed in.

Now, however, the “fairness” algorithm causes the function to, at least sometimes, display results infused with Google’s preferred worldview, the insider said.

When one types in “men can” and makes a space, the suggestions would show phrases like: “men can have babies,” “men can get pregnant,” and “men can have periods.”

When one types in “women can” and makes a space, the suggestions would show phrases like: “women can vote,” “Women can do anything,” and “women can be drafted.”

This is not because these phrases are so popular among users, but because the “fairness” algorithm pulled them from so-called “sources of truth” as it was intentionally “trained” to do, the insider said.

“They are feeding the information and training the AI so that it will return results like this,” he said.

Political bias in Google search results has [likely already shifted massive numbers of undecided voters](#), according to voluminous research on the topic by Robert Epstein, senior research psychologist at the American Institute for Behavioral Research and Technology, a California nonprofit.

“Maybe it is the most important issue that we’ve ever faced in this country for as long as it’s existed,” said Project Veritas founder James O’Keefe. “All the political advertising money spent in the entire world will not have the effect of this company modifying its algorithms.”

“Fairness” on YouTube

The “fairness” algorithm is used to promote Google’s agenda in multiple products, according to the insider, including Google News and video sharing platform YouTube, which Google owns.

He said that Google assigns categories to YouTube videos based on words uttered in the videos. The “fairness” algorithm then elevates or buries the content based on its alignment with Google’s political agenda.

Prager U videos and Dave Rubin’s videos were labeled “right-wing” and “news talk” and have received “heightened analysis” by an AI called Viacon, which, according to the insider, polices YouTube content. Prager U produces educational videos on conservative ideas. Rubin, who describes himself as a classical liberal, hosts a talk show where he says he tries to bridge ideological divides.

People who Google labels as “right-wing news commentators,” regardless of whether they self-identify as such, have their videos disadvantaged, the insider said, specifically mentioning Rubin, pro-Trump satirical channel Carpe Diem, center-left commentator and journalist Tim Pool, and conservative comedian and commentator Steven Crowder.

“They don’t want these opinions to have wide appeal and so they’re coming in and they’re putting their thumb down, and they’re deciding which content the users are allowed to see,” the insider said.

“Fairness” in Google News

Google’s preference for left-leaning sources in its Google News function has been repeatedly pointed out by various media and [even by the president](#).

The Epoch Times on multiple dates tested the function by browsing Google News search results for the word “trump.” Every time, only about 3 to 5 percent of the articles featured on the first 10 pages of the results came from traditionally conservative-leaning media.

Google has maintained that it simply gives preference to more “credible” sources.

“We’re choosing what we define as credible news sources and those news sources don’t necessarily overlap with conservative sources,” Gennai said.

The insider said, however, that Google actually has an editorial agenda. It puts the news sources through the “fairness” algorithm and if one aligns with Google’s agenda, “it pops the top,” he said. “If it doesn’t, then it gets buried.”

[One internal document](#), dated Nov. 27, 2017, put out a goal to “establish a single point of truth” for definition of “news” across Google products.

“What they mean is alignment with the narrative,” the insider said, specifying that “the narrative is manufactured by establishment players.”

Refusing to Change

Google has been accused by Republican lawmakers of political bias in its products, but Gennai said the company is unresponsive to Congress’s criticism.

“They can pressure us, but we’re not changing,” she said.

And it’s not that the company is unaware that its “fairness” doctrine is far from universal.

“The same people who voted for the current president do not agree with our definition of fairness,” Gennai said.

In addition, Gennai appeared to consider Google’s political agenda as a justification to oppose the call from Sen. Elizabeth Warren (D-Mass.) to regulate Google along antitrust lines.

“Elizabeth Warren is saying we should break up Google. And like, I love her but she’s very misguided,” Gennai said. “Like, that will not make it better it will make it worse, because all these smaller companies who don’t have the same resources that we do will be charged with preventing the next Trump situation, it’s like a small company cannot do that.”

Google didn’t respond to a request for comment, but its spokesperson [previously said](#) that “Google has never manipulated or modified the search results or content in any of its products to promote a particular political ideology.”

â Watershed Momentâ

Project Veritas has published accounts of multiple tech insiders who spoke of bias in platforms like Facebook and Pinterest. Some media have received insider information and internal documents on other forms of alleged malpractice at some of these companies, too.

Oâ Keefe called it a â watershed momentâ saying a â number of insidersâ already approached him in the prior 24 hours, showing the tech companies are â in serious trouble.â

â Theyâ re really about to get a deluge of insiders,â he said.

He didnâ t want to diminish the significance of the latest revelations by foreshadowing the next ones, but confirmed thereâ s a lot more to come.

Google Sued For Secretly Collecting Data Of 4.4 Million iPhone Users

SHARE

[Facebook](#)

[Twitter](#)

Google has been accused of “clandestine tracking” of 4.4 million iPhone users in the UK and is facing a lawsuit in the high court for as much as £3.2 billion.

According to a report by [The Guardian](#), Google usurped data from iPhone users through an exploit in the Safari browser. This loophole was found by a Ph.D. researcher in 2012 and termed as “Safari Workaround” which allowed Google to amass personal data.

The information gathered from the loophole allegedly includes users’ race, social class, location, physical and mental health, political views, shopping habits and financial data. This data was used to categorize users into groups for what Google describes as “better-targeted advertising.”

The internet giant Google claims that there are no indications that the Safari Workaround resulted in sharing of the personal data to third parties and there is no way to find out if anyone was affected by the data

harvesting.

Anthony White, the lawyer defending Google said that this lawsuit is aimed at damaging the company's accountability rather than finding compensation for the affected people.

The communications director for Google UK, Tom Price, said that the events in this case "took place over six years ago" and it was "addressed at that time." He also noted that "the privacy and security of our users is extremely important to us" and believes that the case "has no merit and should be dismissed."

Google Suspends Fact Check Program After Being Fact Checked

AFP

by [ALLUM BOKHARI](#) 22 Jan 2018

Google has suspended its recently-rolled out fact check feature, which displayed messages from a range of partisan fact-checkers next to disputed stories in search results, after it was [revealed](#) that it almost exclusively targeted conservative news sites.

The widget, which was rolled out late last year, added a reviewed claims tab to search results for news outlets. For example, a search for Breitbart News would bring up a range of allegedly reviewed stories.

Research from the [Daily Caller](#) found that the widget, which included a range of partisan fact-checkers including the *Washington Post* and Snopes, displayed the reviewed tab next to a wide range of conservative sites while largely ignoring leftist and mainstream outlets.

In addition to bias in their targeting, the feature also made claims about stories from conservative outlets that were not true. For example, the fact-checker [claimed](#) that Breitbart incorrectly reported that an illegal alien had been charged with starting a California wildfire, when in fact the story claimed that an illegal alien was arrested on suspicion of arson a completely different claim.

As Breitbart Tech [previously](#) reported, this was despite the fact that many mainstream outlets have been subject to fact-checks by the organizations which were used to source data for Google's feature. MSNBC and CNN have both had claims disputed by PolitiFact, one of the fact-check organizations used by Google, yet there was no "reviewed stories" tab in search results for those outlets.

A spokesman for Google admitted to the Daily Caller that their feature was flawed.

"We said previously that we encountered challenges in our systems that maps fact checks to publishers, and on further examination it's clear that we are unable to deliver the quality we'd like for users."

Leftist bias at Google has become a hot topic recently. Former employee James Damore's [class action lawsuit](#) has revealed an atmosphere of extreme progressive bias at the company, including the shaming and intimidation of [conservatives](#) and [white males](#). Google's faulty fact-check feature fed concerns that the company's well-documented leftist bias was trickling down into its product.

Like Google, the so-called "impartial fact-checkers" that were relied on by the company claim to be unbiased, but also have a history of partisan favoritism. Snopes, for example, is [staffed](#) with rabid anti-Trumpers, while PolitiFact is [funded](#) by a Clinton Foundation donor and [routinely](#) comes to empirically dubious conclusions that typically favor Democrats.

Google Technology to Read Your Thoughts and Implant New Ones

By [hassam](#)

HAVE you ever thought about something you never shared with anyone, and have been horror-struck at the mere thought of someone coming to know about your little secret? If you have, then you probably have all the more reason to be paranoid now thanks to new and improved security systems being developed around the world to deal with terrorism that inadvertently end up impinging on one's privacy.

Some of the countries involved in such programmes include USA, UK, Spain, Germany and France. Recently, the National Security Agency (NSA) of the US has developed a very efficient method of controlling the human brain. This technology is called Remote Neural Monitoring (RNM) and is expected to revolutionise crime detection and investigation.

What is it?

RNM works remotely to control the brain in order to read and detect any criminal thought taking place inside the mind of a possible perpetrator. Research studies have shown that **the human brain thinks at a rate of about 5000 bits per second** and does not have the capacity to compete with supercomputers performing via satellites, implants and biotelemetry. The human brain has a distinctive set of bioelectric resonance system. For the RNM system, supercomputers are being used and, thus, with its help, supercomputers can send messages through an implanted person's nervous system in order to influence their performance in a desired way.

RNM has been developed after about 50 years of neuro-electromagnetic involuntary human experimentations. According to many scientists, within a few years it is expected that DNA microchips will be implanted in the human brain which would make it inherently controllable. With RNM, it will be possible to read and **control a person's emotional thought processes along with the subconscious and dreams**. At present, around the world, supercomputers are monitoring millions of people simultaneously with the speed of 20 billion bits per second especially in countries like USA, Japan, Israel and many European countries. RNM has a set of certain programs functioning at different levels, like the signals intelligence system which uses electromagnetic frequencies (EMF), to stimulate the brain for RNM and the electronic brain link (EBL). The EMF Brain Stimulation system has been designed as radiation intelligence which means receiving information from inadvertently originated electromagnetic waves in the environment. However, it is not related to radioactivity or nuclear detonation. The recording machines in the signals intelligence system have electronic equipment that investigate electrical activity in humans from a distance. This computer-generated brain mapping can constantly monitor all electrical activities in the brain. The recording aid system decodes individual brain maps for security purposes.

What does it do?

For purposes of electronic evaluation, electrical activity in the speech centre of the brain can be translated in to the subject's verbal thoughts. RNM can send encoded signals to the auditory cortex of the brain directly bypassing the ear. This encoding helps in detecting audio communication. It can also perform electrical mapping of the brain's activity from the visual centre of the brain, which it does by bypassing the eyes and

optic nerves, thus projecting images from the subject's brain onto a video monitor. With this visual and audio memory, both can be visualised and analysed. This system can, remotely and non-invasively, detect information by digitally decoding the evoked potentials in 30-50Hz, 5 milliwatt electromagnetic emissions from the brain. The nerves produce a shifting electrical pattern with a shifting magnetic flux which then puts on a constant amount of electromagnetic waves. There are spikes and patterns which are called evoked potentials in the electromagnetic emission from the brain. The interesting part about this is that the entire exercise is carried out without any physical contact with the subject.

The EMF emissions from the brain can be decoded into current thoughts, images and sounds in the subject's brain. **It sends complicated codes and electromagnetic pulse signals to activate evoked potentials inside the brain, thus generating sounds and visual images in the neural circuits. With its speech, auditory and visual communication systems, RNM allows for a complete audio-visual brain to brain link or a brain-to-computer link.**

Of course, the mechanism needs to decode the resonance frequency of each specific site to modulate the insertion of information in that specific location of the brain. RNM can also detect hearing via electromagnetic microwaves, and it also features the transmission of specific commands into the subconscious, producing visual disturbances, visual hallucinations and injection of words and numbers in to the brain through electromagnetic radiation waves. Also, it manipulates emotions and thoughts and reads thoughts remotely, **causes pain to any nerve of the body, allows for remote manipulation of behaviour, controls sleep patterns** through which control over communication is made easy. This can be used for crime investigation and security management.

Concerns

With all the given benefits of RNM for tracking the illicit and treacherous activities, there are many concerns and risks being pointed out by human rights activists and other scientists. The agencies of human rights around the world have criticised RNM as a violation of basic human rights because it violates privacy and the dignity of thoughts and activities of life. Several countries have protested against it and refer to it as an attack on their human and civil rights. The scientists protesting against the use of RNM believe that **people who**

have been implanted involuntarily become biological robots and guinea pigs for RNM activities in the guise of security. This is an important biological concern related to microchip implantation, which is a hidden technology using microwave radiations for the control of the mind.

Scientists believe that like leukemia and the cancerous risks posed by mobile phones which also emit microwaves, RNM can also pose similar threats to a subject's overall health as the heating effect of tissues with the speed of light is a known effect of high powered microwave and electromagnetic pulse weapons.

Thus, RNM remains a controversial technology which is being used in many countries for security maintenance and surveillance.

Comment

Jim 3 years ago

The uses for RNM technology as a policing tool is pure bullshit.. A government's use of this technology is in violation of every civil and human rights law in existence. Agencies like the NSA are using this technology to remotely access and manipulate the thoughts of millions American citizens in what can be described as nothing less than a modern day version of George Orwell's Big Brother on STEROIDS!

Citizens are being illegally interrogated within their own homes, without ever being charged with a crime, as their 4TH Amendment rights are completely denied them!

In the United States, alone, thousands of people have already come forward to describe this technology and how it is being used to both illegally spy on them, while also manipulating their thoughts, as they are targeted for non consensual human experimentation.

See John St. Clair Akwei's lawsuit to learn more about this. Also my Website which I have listed the URL to below:

<http://www.9-11themotherofallblackoperations.blogs>

Also see the activist Websites: Freedom From Covert Harassment & Surveillance and FEDAME, both of which can be accessed through Google.

Jim 2 years ago

I should also note that you do NOT need to be implanted with a RFID, DNA or anyother type of chip to be targeted by the NSA for its Signals Intelligence surveillance of your person. The NSA targets you by your own unique bioelectromagnetic field, which enables NSA cryptologists track you by the NSA's Signals Intelligence EMF scanning network.

Please read John St. Clair Akwei's lawsuit against the NSA to learn more, as well as my own Website which documents this insidious technology in great detail.

Google: AKWEI VS NSA

Also see:

<http://www.9-11themotherofallblackoperations.blogs>

Guest 2 years ago

You don't list any sources to back up your claim. I have read the Akwei vs. NSA in addition to this post and I don't believe in the idea that any human can be turned into walking, live, video cameras for the government. I don't believe that our thoughts can be determined either.

What you do have correct is the ability to send signals directly to the auditory cortex. This technology can be used to enroll people in "sleep deprivation programs". Especially effective when coupled with biosensors which project brain wave/sleep data to a remote source. If I hadn't been in the program myself, I wouldn't have believed this (sleep deprived since 3/2006).

I'm not a drug dealer, criminal, or outspoken anti-American. I just happened to be in the wrong place at the right time.

Anonymous 2 years ago

As a long-term target of this technology I am certain that it can be used to manipulate the thoughts of those being used for such non consensual human experimentation as has been attested to by hundreds of other people who are being illegally used as such subjects.

As such, there is no longer any question that the NSA and other agencies of U.S. Intel are committing serious crimes against American citizens, while denying them their right to due process of law.

A further sign of the New World Order and its intent to destroy the U.S. Bill of Rights.

Another problem is that Intel cyberstalks many of its targets over the Internet, with the express intention of posting remarks which are used in which to discredit the comments of legitimate targets of non consensual human experimentation, since the Intel community would not be around for very long if the American people learned that they had been brain fingerprinted by the NSA back in the 1970's, and electronically monitored since the early 1980's.

A true crime of treason and an executionable offense.

Guest 2 years ago

The NSA would never experiment on unwilling US citizens! That's what contracted firms are for. ;)

[**SquidWard**](#) 2 years ago

Anonymous is right. Jim is most certainly out to discredit the claims of the victims. His website appears legit at first, but is pure gobbledygook! There are plenty other bogus webs out there making ridiculous claims - all with intent to undermine the credibility of the real victims. I wonder who is sending them paychecks....

anonymous 2 years ago

9-11 the mother of all black operations is documents the NSA's illegal surveillance and use of American citizens for non consensual experimentation. It also cites former NSA operative John St. Clair Akwei's 1991 lawsuit against the NSA which describes the NSA's Signals Intelligence operations in detail.

It would seem that from the prior to post Intel's ops are on this site to discredit legitimate whistle blowers like Akwei, Marino, Tice and myriad others who are telling some very ugly truths about the NSA that the U.S. Intelligence community would rather not have told.

As for paychecks, Squidwad is likely collecting them from Intel for cyberstalking legitimate targets of these crimes, and likely posted the anonymous comment before his own.

Jim 2 years ago

AKWEI VS NSA is an excellent source. And you will notice that the article Akwei VS NSA supplies at least 40 additional references. Unfortunately the NSA has been very sneaky about illegally brain fingerprinting American citizens without our knowledge or consent. A terrible thing.

gloria 2 years ago

Where is the RNM located?

Johnny 24 months ago

If a non-believer would spend some time to research patents and such, you could see that the technology exists. Sure, the NSA and Police aren't going to admit using something that will financially break them, or an admission to violating the Constitution of the United States. They may however claim your part of a gang or terrorist organization when you aren't, so the Attorney General can file for a Secret Court Warrant to interrogate you in this manner.

I have personally heard the admission of an individual teaching the police in Missouri to use this technology. Chicago District of the FBI are wide boundaries that include Missouri. The abuse is phenomenal and will certainly cause a financial collapse of the economy when it is fully exposed. A long time ago the CB Radio was a way the police communicated. Nowadays the police use a narrow bandwidth radio that can be directed to a subject with precise alignment with the use of GPS Satellite Systems that Chicago District uses now.

Johnny 24 months ago

This is a site with US Patents:

ALL WHO ARE INVOLVED IN THE DEVELOPMENT OF THIS TECHNOLOGY WILL ALL HAVE THERE PART IN THE LAKE OF FIRE AND BRIMSTONE!!! THIS IS EVIL AND DEMONIC AND POINTS TOWARDS SATAN HIMSELF. ALL WHO ARE RESPONSIBLE THINK THEY WILL GET AWAY WITH THIS CRIME OF HUMANITY , BUT LIKE THERE EVIL FATHER SATAN ARE LIVING WITHIN LIES AND DECEPTION. THEY WILL BE DESTROYED VERY SOON, AND WILL NOT GET AWAY WITH ANY OF THIS EVIL AND WICKEDNESS.

[taggster](#) 21 months ago

Many people may say that they don't believe in this. I am one who can say that it is true. I am a victim of this. Unfortunately, there is no one willing to admit in what has taken place. I have been forced out of my job, convinced to check myself into psychiatric hospitals. I have been followed and I have also had my brain tweaked repeatedly on a number of occasions when I wouldn't succumb to voices that were presenting what would happen to me if I didn't listen to them. So for me, I'm not in a state of denial but I am in a state of confusion because I don't know how to make these people stop and if I don't find some type of avenue to create a resolution to this I fear that this will continue for the rest of my life. I have spent the last three years building a case against these people. The worst part about it for me is that I am an HIV positive gay male which you'd think that maybe these people would show some remorse for what they have done. I have had my health insurance taken from me because of this fiasco and I have had to start my life over in another city and I am still being talked to on a daily basis. I started hearing these people more frequently after something short circuited in my brain which sounded like static on a television. Ever since then I have been tormented on a daily basis by the machine. I have had to listen to statements repeat themselves everyday for over a year. Their goal is to make you completely succumb to them by letting them take your sanity. Be thankful that this isn't happening to you. If anyone has any ideas for how I can attack this, blocking a signal or anything it is much appreciated.

portland 21 months ago

I do believe in this. That millions of people are being monitored and that before you start thinking "I have nothing to hide." I say I have been monitored since I was 5 or 6 and that my Mother has also been Brian Printed.

"They" have a templet so to say. So if you start to see blue lights behind your eyes, hear intermittant voices, think you are being contacted by a religion, or that some one of interest like a star or political figure is interested in you socially know that you could be under attack.

This kind of torture was used in the south by the KKK to expel blacks. When do we hear about it? How long have you heard the joke about someone saying that they are being shot by micro waves from the satilights, those people went to the asylem or committed suicide and only the internet and shear numbers have made it common knowledge.

People have reported that they felt that they had been monitored in school and made to feel tired, irritable and forgetful. That at least three states have made Remote Neural Monitoring illegal with jail time to be serves if it is found you are using this technology one such state is Michigan.

This is a war being fought and the casualties are people thinking they need to go to the doctor, therapist, institutions and hospitals. "They" are selecting who is sucessful. And it is not the underprivlged. There is alot of money to be made on prescriptions for the mentally unable and this technology is some how physical and very powerful as it pertains to the body.

Once you are hip to the material you might notice that this kind of Touture is being used everywhere and not to find the criminals as first reported. But to create criminals. I read in "Rolling Stone" issue 11/12/2009, that Louis Bressler of the Fort Carson Murder Spree heard and was fighting off a demon as reported by his girlfriend. This struck me because I had known another person who said when they were attacked they had been made to hear demon voices.

"They" can use this technology to sublimanally (sp?) suggest you to buy tings, vote, that it is reportedly very hard to ascertain your inner voice from their's and that because of studies on the brain "They" can map out and make you do and say things very strange. That there are no secrets not even the lock to your safe your social

sincerity number how you love your wife or husband.

There has to be counter technology or there are no spys no state secrets. Science would all be shared. Some would have a very unfair advantage over the all. I do not support the use of Microwave Technology to be used.

I am very unhappy to know that this technology exists and to read about people possibly be made to lose sleep and then go committ crimes or not succeed in school or be molested via satilight or to think they are having a religious moment and good exists to be let down and know it is just a community pervert and peoples lives are being molded by weirdos. Sad.

bobdunn 20 months ago

The use of lexical patterns is used by supercomputer program, and of course advanced neural network that learns (somewhat), a adept person was known to figure out the patterns opposites of meaning, grammatical rules, etc.

The San Diego Skulls and Crossbones (UCSD) are known t have such a system at their disposal having stolen pass keys and technology from their CIA or NSA or military fathers and mothers without their knowledge. With such pass keys and knowledge of the systems it is thought that they even use the KH-9 satellites system without recognition by responsible authority that really un-authorized personnel are accessing such National systems and also through the U of C chain Universitys and their connections with the National Laboratorys like the Argonne National Laboratorys. See Non-Lethal Weapons initiative.

Ed 20 months ago

Seems that this situation also exists in Coronado, CA.

So... how about some inexpensive detectors and countermeasures? The adversary will only hide behind the "have you seen a pschatrist" cover until admissable evidence is placed in front of a legal body with the clout to change the situation. And I wouldn't suppose that hanging from a rope or victim of a carbomb is what most judges or federal agents consider a reason to prosecute a case.

Also, the temptation for both sides to use this harassment must be great. What, then, to do? As a victim, I am equally ambivalent. Education and countermeasures seem lilt the only viable option.

.

Wow ! My book although fiction, (my piece of mind and plausible denial)is based upon actual facts discusses my first hand experiences and observations.... Perhaps humorous, is the man who built a tinfoil hat to protect himself. For those who are "aware" my book has inferred, implied information for those who are aware of the abuse of the "need to know classified philosophy).

Kirt Ian Williams of Omaha,NE 18 months ago

I know that I am an involuntary victim of remote neural monitoring. I do not know who it is all together but I believe it has its origins with the U.S. Government and is being used on behalf of the State of Nebraska. Not only are my thoughts being read but they are making me here them. Full conversations and everything but only when I am alone which rules out schizophrenia all together. I am being harassed by everyone I meet here in Omaha including my family. Everyone has turned on me like something out of the invasion of the body snatchers or something. I would laugh but it is not really funny when it happens to you. They make me see

hallucinations and also feel things. The main thing they are doing is invading my dreams. I know it is them because not only is the dream vivid but I haven't remembered a dream since I was 16 years old and ever since they have started I remember them all. Some kind of way they are using mind control tactics and subliminal messages to make me do things as well as just making me do them. They usually don't do this around people either. I guess they don't want to scare or hurt their agents of harassment. If you don't believe me check out <http://www.washingtonpost.com/wp-dyn/content/artic> and <http://searchwarp.com/swa310640.htm> They describe what's happening me exactly. Hit me up with answer or put this out further on the web or whatever you can do. kirtwilliams@hotmail.com

I would guess that wearing something like a football or motorcycle helmet lined with lead and woven copper net might keep out the microwaves radiation.

Mary Ofstead 18 months ago

I'm a victim. My brain is getting pounded, they move my jaw, my cheeks, make me not sleep, not breathe...if it weren't for Tim Rifat's remote viewing and Shamanic overlay I would be dead. He's had to revive me 5 times....they've sent death threats if I do any spiritual or metaphysical healing they'll kill me. There's huge magnetic pulse on the back of my neck he's trying to get off....they're CRIMINALS...should be in JAIL. Obama is responsible for this. One day he will be sorry he didn't do any of this and they do it to him and his family. It's heinous, they've attacked me every single night and day horribly to the point of not being able to listen, read, think, sleep, eat...you name it, they've done it so my body....they're horribly horrible CRIMINALS.....

a victim 18 months ago

They are using this technology to steal ideas and intellectual property from people. The problem is that you can't sue these criminals even though you know that they are making money with your ideas.

firstbornbirdman 17 months ago

At first I thought I myself was crazy, but then I discovered about this covert remote mental harassment and torture by different arms of the intelligent community(NSA,CIA,etc) I didn't understand why they have victimized me and other innocent citizens but when I learned about the order of the illuminati it began to make sense. This is all about a mind control agenda on a global scale. This silent holocaust will only get worse with time unless there is a collective conscious awakening. Americans must exercise what freedoms that still remain and take our government back before they gain full control! These are perilous times indeed!

ERIC GODDARD 17 months ago

IT'S HARD TO BELIEVE HOW ONE GENERATION CAN WITNESS THE WARNING ABOUT BIG BROTHER AS KIDS IN THE 60'S, AND LIVE TO SEE IT ACTUALLY HAPPENING TO US TODAY. WOW, SO SOON !! AND SO OBVIOUS.

IF YOU'RE IN YOUR 50'S, LIKE ME, WE ARE THE FIRST GENERATION TO HAVE TODAY'S REMOTE NEURAL COMMUNICATION, MONITORING AND CONTROL TECHNOLOGY UNFILTERED INTO OUR MINDS. THE ONLY ONES WITH ENOUGH FIRSTHAND KNOWLEDGE OF RECENT HISTORY TO ACT IN BEHALF OF JUSTICE REGARDING THE SNEAKY AND UNDERHANDED WAY OUR GOVERNMENT IS USING IT.

AND A VERY BIG RESPONSIBILITY TO FUTURE GENERATIONS IN THE USA, TO MAKE SURE WE DON'T ALLOW IT TO CONTINUE TO BE USED AS A TORTURE AND MIND CONTROL WEAPON, OR TO SEGREGATE, PROGRAM AND PIT US AGAINST EACH OTHER IN THE UNITED STATES BY OUR OWN GOVERNMENT'S COVERT AGENCIES AND FEDERALLY CONTRACTED PRIVATE ENTERPRISES.

hey 17 months ago

what do you think mass hallucination exercises involving ufo's are?these programs also involve religion....who are you praying to?who plays god?serve your master and he will serve you..."i've seen it,i've lived it...i saw lots more,buttoo bad executive law makes people choose between self-sedation(prescriptions) or torture...talk about it,have your rights taken away....

ERIC GODDARD 17 months ago

WE ALL NEED TO FIND OUT WHY THE PEOPLE WE PAY A LOT OF MONEY TO DO THE JOB OF GETTING TO THE TRUTH, UPHOLDING THE LAW, AND PROTECTING PEOPLE FROM THESE THINGS, ARE LYING BY REFUSING TO ADMIT THE PERPETRATORS EXISTS.

AND TURNING VICTIMS OF VIOLENT CRIMES OVER TO STATE MENTAL INSTITUTIONS, AND ALLOWING PERFECTLY SANE AMERICAN CITIZENS TO BE WAREHOUSED FOR LONG PERIODS OF TIME ILLEGALLY UNDER INCARCERATION.

UNFORTUNATELY THEY SEEM TO HAVE COME TO BELIEVE THEY CAN GET AWAY WITH ACTING LIKE BY BEING THE VERY IMPORTANT DOCTORS, PSYCHIATRISTS, OFFICERS OF THE LAW, FBI AGENTS, ELECTED OFFICIALS AND PILLARS OF THE COMMUNITY, THEY CAN JUST ACT LIKE IT WOULD BE A WASTE OF THEIR VERY VALUABLE TIME TO PURSUE THE DELUSIONS AND HALLUCINATIONS OF A PARANOID SCHIZOPHRENIC WHEN IT CONCERNS BEING CONFRONTED WITH THIS TECHNOLOGY.

AND WITH AN ATTITUDE THAT ANYONE THE POLICE CONSIDER ((WORTHY)) OF THE TRUTH AND PROTECTION REGARDING PROBLEMS WITH THE PEOPLE CONTROLLING THIS TECHNOLOGY, WOULDN'T NEED TO COME TO THEM FOR HELP IN THE FIRST PLACE.

AND WHAT THEY'VE NEVER HAD TO GO TROUGH THEMSELVES, WILL ALL JUST MIRACULOUSLY DISAPPEAR AS SOON AS THEY RID THEMSELVES OF THE WORTHLESS SCUMBAG LOWLIFE DOPE HEADS BY HAVING THEM PUT IN PRISONS OR DECLARED INSANE AND COMMITTED IN MENTAL INSTITUTIONS SO THEY CAN CONTINUE PRETENDING THIS VERY REAL TECHNOLOGY PEOPLE'S LIVES ARE BEING RUINED WITH, DOESN'T EXIST LIKE THEY WERE OBVIOUSLY TOLD TO DO BY PEOPLE THEY HAVE SOMEHOW CAME TO BELIEVE DESERVE RESPECT.

THIS IS COMPLETELY UNACCEPTABLE IN AMERICAN SOCIETY.

THIS GOVERNMENT'S HAVING TO BE SNEAKY UNDERHANDED, MANIPULATIVE AND INTIMIDATING TO DO THESE THINGS.

AND I'LL BE VERY INTERESTED TO FIND OUT JUST EXACTLY HOW MANY OTHER PEOPLE THEY'VE DONE THIS TO AFTER WE'VE HAD A COMPLETE REEVALUATION OF EVERY AMERICAN CITIZEN UNFORTUNATE ENOUGH TO FIND THEMSELVES IN THE CLUTCHES OF THESE CO-CONSPIRATOR PUPPETS CALLING THEMSELVES DOCTORS AT SOUTHERN NEVADA ADULT MENTAL HEALTH.

AND EVERY OTHER STATE MENTAL INSTITUTION IN THE COUNTRY IF I CAN WAKE PEOPLE UP TO WHAT THEIR REALLY UP TO. I'M A FIRST HAND VICTOM OF THIS AND ALOT MORE.

It is good use to make prostitute, blackmail, assacination, smagling etc vulnarable activity. SONY SAMSUNG dWiseSolution companies CEOs using this RNM for prostitution bussiness diff. Way for their won profit. This is great job of those CEOs.

hey 16 months ago

once when broadcasts were bouncing from one electronic item to another i was using a digital voice recorder to record what i was hearing when it was used as an improvised electronic harassment device itself...i rewound it and sure enough it had captured the same statement i had heard,but without the sythesized terroristic sound...also lookup emf protection....certain lined fabrics muffle the sound...works best covering your whole body....a statistical study of this could be proven...also paint is availiable,but too expensive for anyone suffering this to afford probably...i covered one member of a "federal Company" with this fabric and imagine that? the police showed up and said someone had dialed 911,but this person didnt have a phone..ha hai have been investigating this for years and that is pretty much how i came to be a victim...some things they just cannot keep their mouths shut about...ha,ha,...

then they offer you peace to do their work...ha ha ...and on disability you have all the necessities and excuses you need to do it....this is human trafficking,forced labor,slavery,fraud,malpractice,torture,rape,etc....everyone is afraid to speakout...sometimes innocents are targeted for plausible deniability purposes...they can give you a heart attack...talk about intimidation....i can prove it with support from unknown investigators...why is the press so silent on this?my liberty has been assaulted,,,,i could go on and on...anyone know a lawyer that works on these kinda cases?

jackfrost 16 months ago

its not any speaking out that needs to take place an act of war against theses criminals must take place...

[another anony](#) 16 months ago

Something is going on, but who's to say it's the NSA doing the non consensual experiments? Whatever it is, it appears government sanctioned. Some of us survivors from previous ridiculous unethical experiments got on the electronic harassment list just to discredit us. The weird thing is that it's almost completely ignored by the very people who should be concerned.

What's sad too is that the groups associated with help for this are pretty much "cointelproed," making it that much harder for any efficient activism. The end of this has to come from the inside. One can only hope that people inside the government with morals, ethics and balls will step forward and say stop. This is not national security. This is bs.

[another anony](#) 16 months ago

I thought of another point. Even if supercomputers are used to "decode" the brain there are two essential problems that boil down to this: all science is limited by human interpretation. That is, someone human

decides what's important and how to program the computer and someone human has to read the output. It's the same blindspot that has caused such arrogance in the sciences.

To be a victim of whatever kind of nonconsensual experimentation is doubly offensive when one doesn't even respect the science/scientists behind it. The same goes to the behavioralists who feel that if the view us as our "animal" selves they'll get far in understanding human behavior. They don't really even understand the other animals. Someone should write a blog on scientific narcissism.

starkeep 15 months ago

My opinion is that the fbi has a national threat assessment team and that corporation can put people on that list. ONce on the harrassment continues for life.

Kola Kehinde 14 months ago

What if the conditions of science today is to ask God to finally seperate Good from Evil. How?,when we are living the goodness by words and practice,a righteous pattern or 'WAYS' or systems is all we need to confirm the true meaning of existence. Selection process from these good guys will be compiled, stored and directed towards all attempts to neutralise our eternal advantage. We all know the difference between the two but pressure of life choices hands us over to evil, but with powerful "FEELING" systems the soul of the GOOD will make 'NO WAY'to the devil much more relevant at all confrontation points of (devlish,deviate, divide,delude,devolved,etc.)

guero 14 months ago

i have no idea what they want but they are targetting soldiers such as myself as for my knowledge its a machine that records all your souroundings and people you meet every day as if they are making connections.they have something up there sleeve as if they looking for some one.music is a big part in this it seems to drive them crazy i tell them to confront me but they know thats not a good idea they are scare guns guns guns and more guns will save us always keep one thats a fact.remind yourself every day that they are there isolate as much possible the mexican mountains is my safe zone when i get there i have my brain back i promise youll feel the same.this is something the goverment has fault for we all know that.we are special keep that in mind stop trying to convince people to beleive there not going too till experience it themselves.tell them guero is going to kill them for a whole day and youll see they will act even more scare of us we are powerfull this our memorys our minds our brains and they robbed us from them we have to stop this on our own music more music beats them at there own game we are not crazy dont let them fool you by not bothering you anymore they are there and they are real note evry situation and every person you meet try to make the connection yourself then note the people they knoe and you will see how big this is every person has three screens one for our memorys two for our life as in what you are doing right now three as for what you feel and image map it out and youll understand im here for all of you and im not gonna stop tell them that all the time guero guero guero guero guero is coming and they will stop they are scare already thoughts you have a regular basis are fake go with gut instinct all the time.sleeping is the hardest because they are the ones that make those dreams i had one dream for months over and over dont worry our numbers are growing and we are getting stronger be happy and isolate as much possible dont let them finish what they started thats there mission to have a link with every mind possible this guero from chicago and note they use signals antennas make it stronger dejavu is a big factor in this game when something tells you you seen it trust me you have driving is a big hazard avoid it as much possible you are not alone we are in this together be careful and dont forget there day will come regardless technology moves fast so note every thing since they started a keep it safe in details okay they gonna die for messing with us be proud of yourself you are part of there destruction and they know it thats why they have messed with you.

tower* 14 months ago

I am an experiment subject from Tower 8... I also have 16 implants in my teeth... No Worries! They underestimated the mentals! I give them so much grief... they will probably drop me one day... LOL

Tess 12 months ago

I thought this article was great.

There's a historic investigative process that I'm resolving in london, which I could greatly advance using RNM if the police are brave enough in accepting that people telling the truth could remember the truth and create a digital image from recollecting a historic experience.

Im sure that involuntary implanting has been a way that unscrupulous people frightened from witnesses telling the truth, thought they were minimising the chance for people believing witnesses. But there is the thought that what goes around comes around and with that, the possible chance that these same technologies could be an answer in how witnesses prove that the history was the truth.

fedup 12 months ago

I work at the Public Guardian's Office for Santa Clara County California and I've been a victim for over two years. I'm moving to the Philippines. I'm done here. Prayerfully, I will be able to live my life to the fullest in the Philippines.

Knufje 11 months ago

I am a survivor. I was attached involuntary to the worldwide SWEATS system. I think this Remote Neural Monitoring stuff is technically operated by adresssing (HAARP? Alaska and Ohio based) DNA/RNA of humans, but who cares. It works. Being a surveilant has both good things and bad things: lonely ppl can benefit by feeling not lonely anymore. Because of a sweet live follower companion they hear. And the targeted bad guys can commit a crime by being provoked in their head, and that is what we dont want but it happens. But in that way I can image it is shocking to see someone die you perpretate the brains(and thus private life) off.

Good luck with your personally use of this system. Roma Est. Bye big brother.

Jun 11 months ago

Funny, 'coz I've got a few experiments of my own to conduct. Involving a machette and surgeon's knives. I think I just found my subjects =]

miserable 11 months ago

yep - a victim. it's either a rnm device or something that simulates the same things. does anyone know? it's the worst life in the world.

7 Months in 10 months ago

I have to say, in all my reading, I haven't come across anyone with objective views and experiences such as mine.

I'll start by saying that at the outset of being inducted into the mind control program/network, my life was

essentially taken apart and ruined. I spent most every second of every day with artificially induced anxiety/pounding heartbeat, occasionally was hit with enough radiation to make me pass out (I'm a very athletic individual).

However, about three months into things began to change, as if I had somehow "graduated" my initiation. The system began to placate me. We are a telepathic people/race now. The program allows me to communicate with my girlfriend and friends telepathically. I can with nothing more than my own thoughts communicate with, influence feelings of, induce harm upon and data mine past life experiences of people around me. The system revolves around human brain entrainment, to prepare human beings for future transcendence into Singularity. Instead of inducing pain the system induces intense waves of artificial pleasure and calm over me like nothing I've ever experienced.

I'm confident that a far larger majority of our people than most of you think are already on this network, and are being placated like me so as not to talk about the existence of said network.

Anyone else have experiences similar to mine?

Raj Kumar Rajahnayagam 10 months ago

Dear Friends,

I am going through a big problems similar to what is described above.

I am not sure to whom I can seek help, I seek assistance. My e mail will be cute5050@yahoo.com sorry my email is not so professional and my English is not perfect.

I was in Switzerland, did my business research, then became unconscious not sure for how long, I was in the holy ground then when i got attacked by this wave on my head, all I know is that I was going to India to visit the holy pilgrims, meanwhile (suspecting) friends and relatives were gathering informations to solve the problem from Edwin and Jeffrey Anrada (Philippine who hold Swiss Passport), I am Malaysian (was questioned also by don't know who are the people suspecting the Government) United State and the EU Organization (Suspected was involved)

I am not a criminal, almost all my Business Ideas was taken out used by many media, movies by few artist or so called singers are singing to promote some ideas of mine, and movie artist or directors using few ideas from mine.

I was badly pained by this wave, I often got this I don't know what to call them, like something poking my heart, kidney, livers, stomach,brains, head, back bones, basically my whole body.

I am still sending mails to a friend who claimed to sponsor me in solving my problems, and suspected to collect earning from that or funds or investment... I am not sure... there were psychological question put onto me... he managed to form a team to solve many problems using so called communication using no mobiles but my brains through satellite connections.

I am sending some mails, but his responds are different like he doesn't know that... what ever... I still send mails to many link or up date him my mails just in case if I am murdered by this wave.

I am not sure if you can help me... I am seeking your help, please mail to the mentioned email add.

Raj

Marie 10 months ago

I do not think Remote Neural Monitoring is a good tool for Police Work. The Monitoring is only as good as the Monitorer behind the machine. Monitoring can and has been used to cause disease and damage to the environment. Think about it is only radioactive. It's a microwave laser beam aimed at your head. Monitors have used the Beam to cause innocent peoples to hurt themselves and others. Mind reading can not replace community. If you want less crime give more. Those monitors and it could be anyone even other governments kill people and cause un-natural mental disorders. I just get really upset when some fool who has not been monitored and slandered thinks it's just "Mindreading." It is much more dangerous than that. And there is no standard. You can't complain to the police or FBI if it is done poorly. No secrets disclose monitoring to the public so you are being monitored improperly you can get help. Look around at the children with little or no hair and strange shaped heads. People with wide parts in their hair. Monitoring is here. Acne. Flu. Mental illness. Heart disease. all can be caused by Monitoring.

guest 7 months ago

i would like to say, i do believe that people can be remotely controlled by others using these chips.

i have to say i am one of those. i don't know how i don't know why, they implanted a chip inside me, but believe this, they really control everything and change it. your habits, personality, concentration.... everything. i am not paranoid or crazy, i tested that already.

i have only one question, how can you get these chips or this controlling out of your life?

please can someone help me!!! P.S. i live in Germany

Jesse mccrum 7 months ago

it can be used for lots of things i believe it has to do with training that can have to do with endurance, causing fatigue otherwise can be called harassing to the patient, subject. think medical study signed on and next thing you know your life is under someone's control but you had no way of knowing what the study was about in fact you probably just signed up for an english 101 class and over the course of time became more and more in "training" "voodoo" "mind is being trained" removal of past issues,

guest 5 months ago

Voice-to-Skull is a radio that can target one person at a time. The person hears the voice-to-skull operators speak whether they want to or not, without the aid of any chips or receiving device. Some people have experienced night and day verbal harassment by this technology which can last years sometimes.

A helpful tool for this is to listen to a jumble of sounds, such as a mix of 6 radios found below. This drowns out the voices of harassers, making them just one voice in a crowd.

This website has a mix of 6 radios for victims suffering from electronic harassment:

<http://www.raven1.net/audio/6radios-lo.mp3>

Another simple tool is to listen to 2 or more radios at once, or to keep the T.V. on at the same time as a radio, making a similar jumble of sound.

Taking a simple sleeping pill at night is helpful in combating nightly noise regardless of the source.

Mind you, these 'cures' only work for those suffering artificially induced 'auditory hallucinations'. People suffering from real ones need traditional medication.

If this happens to you, and even if it hasn't, write to your Senator and Representative, educating them on the issue, and urging them to ban nonconsensual human experimentation, and to rid us of psychological weapons. At least ask them to create an avenue for victims to safely complain of abuse, and a human rights committee to look into this!

M.P. 5 months ago

I have had experiences with a device similar to a neurophone (i.e. a mindreading technology). I found something curious. The operators of the machinery could 'hear' words thought, and 'see' pictures, but did not necessarily have the remotest idea what those meant to the thinker. People's thoughts can be scattered, we are capable of thinking one thing and doing another, or acting without thinking at all. Also the recordings of those thoughts can be easily edited to mean just the opposite of what they seemed to be. This really ruins the tool as far as national security goes.

Jeffery Brian Bahry 4 months ago

I am predicting this technology to be announced soon.

theone

important! 4 months ago

Social cognitive psychologists named Dr. matthew Lieberman and Dr. Naomi Eisenberger (at UCLA) have been using this type of technology on un-consenting individuals for over 7 years now! They have been using it to unethically obtain their scientific data to their social cognitive neuroscience research experiments and to illegally jump ahead of their competition. They use it for unethical neuro-marketing research ,ways of persuasion and aid in developing mind reading technologies. They also deliberately cause pain to their un-consenting subjects to monitor the harmful damaging effects that extreme amounts of long-term physical and emotional pain does to the body's immune system, health,brain and well-being!

They use it to illegally and immorally monitor their un-consenting and un-knowing research subjects as they force them to interact in extremely distressing and harmful real-time social situations that ,UCLA's Dr. Matthew Lieberman and Dr. Naomi Eisenberger, had maliciously manipulated in ways that will cause their research subjects to experience extreme amounts of social distress! They have used this unethical tactic, to acquire their fraudulent scientific data that was pointed out in the ongoing on-line debate called 'The Scan Scandal'!

important! 4 months ago

A company called , 'North Vector Inc.' uses this type of technology in their line of work! They are doing research and development with this type of technology and conducting cold war style field testing to develop different ways that they can use this technology to covertly harm and break a person down.

North Vector Inc. is located in Menlo Park , Calif.. It is owned and ran by ex-navy seals named Chuck O'connor , Ross Hangebrauk and Geoffrey Baehr ,who worked for sunmicrosystems. Gregg andrew Hurwitz is a author and a good friend of theirs who hangs out with them to get information he can use in for his novels and scripts for the series V on prime time Television ect..

Nuatan 3 months ago

Remote Neural Monitoring details:

It is no longer necessary to use electrodes to monitor brain function at a distance. After Delgado's experiments in the 1950s, began to use a model for EEG biometrics at a distance that allows the individuation and activation of mental functions to different individuals, and distance, without electrodes. Details are on this site that deals with the physical control of the mind so scientific and objective. <https://sites.google.com/site/controlmental>

Anonymous 3 months ago

This hideous operation that is being conducted, should be, eliminated! If the government cannot be stopped, man-kind doomed! RNM loves to create hallucination, (Smiling signs, "Speed limit signs 55' and more! Sleep deprivation, control bodily functions! Real pain in the "Ass".!

Anonymous 3 months ago

First of all this is a major crime ring/rape ring and anyone this is happening to needs to take the situation seriously. We have all been lied to and have believed this is the government or government agents. It is not, it is a crime ring and all who have had this happen to them need to report to their nearest military recruiting station in person or if not possible by phone to be protected as law enforcement has been unsuccessful in responding fast enough or being aware of the technology. Please go to the military asap. They made the technology and take the situation seriously. I myself went to a recruiting station and reported it as a bluetooth implanted behind my ear. A soldier was posted at my near my residence immediately.

.

Guinea Pig 3 months ago

Like any technology it can be used for good or evil. Obviously also like most technologies it is first being used for evil. Usually when a technology is released there is no stopping it. I think that it should be released to the public domain immediately. The public domain can use it for communications, education and psychology/health. The public domain will also allow creation of counter measures and personal prevention methods which is why this is obviously being kept a secret. ALL TRANSMISSIONS CAN BE STOPPED.

I think one of the major issues facing this technology being used for crime prevention is that it is: a violation of one's rights not to incriminate themselves and many more, what one thinks is many times not what one does (ever think of hitting your boss or a coworker,) and it would be used as a pre-crime basis which is absolutely ludicrous and our criminal judicial system is very much designed for crimes committed. There is VERY reasonable doubt that someone would not do something they have not yet done. In short: release it to the public sphere and when laws are re-designed to accommodate such conflicts then it should be revisited. The fact that it is released for crime prevention first is a sign of our times.

Guinea Pig 3 months ago

PS: Does anyone know if this thing can detect emotions? If not I think it would another big time downfall.

M 2 months ago

There are some things you won't be capable of doing anything about your problems. I just want to say this...All of this can be broken down to make sense. I'm not the one to answer but there will NEVER be any Judicial area that will acknowledge this kind of mind minuplation, it says so. So do something productive and keep busy it helps keeps your mind too busy for anything to bother you. Hang in there - if you are having these problems your going to have them the rest of your life. So, don't be angry it doesn't help your situation. Put it behind you and stay away from thinking about it. Again, keep busy and rest only when someone is with you. You should NEVER discuss, talk, or write anything about what you are thinking or you will be labled by the government as a Paranoid Schizophrenic which in some cases can be helpful.

guest 2 months ago

i believe this whole theory.. is BS, you people sound like mental patients talking. can you guys not ignore this, i do everyday..for the past 4 years i heard stuff, now i ignore it...toughen up and dont be scared, s/n you guys posting stuff like this leads to one believing somethings wrong with them

another 2 months ago

I believe there is another factor here. It is thought that a chip can be implanted within, and given a number as in a phone number,accessed as such, and then it is sold for money. It can be used as a game to harrass, or if people know the right people, can be used to help that individual achieve their goals in life. Beware of people and family needing money and those that are jealous of you.

Debbie 2 months ago

The microchips are probably in everyone now and it is not big brother, it is the American Mafia controlling everyone. They see everything every body does from underground. They are using the Technology to TERRORIZE people and make their victims vulnerable. Schizophrenia is not a mental disorder, it is Mafia CRIMES, the Mafia playing God, evil God, they've fooled everyone into thinking God was good. The churches have been supporting an evil society underground where they are abusing, torturing, and mutilating innocent people for Eternal Life to TERRORIZE their MONEY GENERATOR SLAVE to GENERATE MONEY, robbing it from the rest of the world.

These gangsters told me about TERRORIZING people, abducting people, STAGING INCIDENTS ans ACTS, Sophisticated Technology beyond that of normal society, and chips implanted in their hands which allows them access into their secret underground society. Now that they are TERRORIZING me, through their Sophisticated Technology by spying through my brain they are showing and telling me they have Mind Control Technology on everybody. The Bible talks about the 'Mark of the Beast' and it will be had by everyone, in nonsymbolic terms the 'Mark' is Mind Control, and the 'Beast' is the Mafia. These are the worlds most wanted TERRORISTS, STAGING EVENTS and ACTS that are causing a cataclysmic, catastrophic, economic crisis.

They are Controlling peoples minds so that they can get away with their CRIMES. They told me about STAGING DEATHS about 11 and 12 years ago, and about 2 years ago I realized they had STAGED my mother's death about 23 years ago and abducted her underground and have been torturing her all this time, and using their Mind Control Technology they forced my Uncle to hear my mom getting beaten up to make him GENERATE A LOT OF MONEY FAST. This story is actually Revelations in the Bible which is PREMEDITATED CRIMES to rob the system, sucking up all the MONEY. They need to be stopped before the economic crisis gets any worse. There should be a way of disabling their Mind Control Technology so

people can have their own mind again.

This Technology can see inside everyone's mind and can communicate with them too, but is really used to TERRORIZE victims because it exposes people's private information. This is a violation of human rights. They also say they can erase something out of someone's memory. This is dangerous Technology in the hands of wicked people.

[ywww4234yahooca](#) 2 months ago

and everyone knows, as much as people do not talk about it, everyone knows about the high tech surveillance, and the criminals know too. People are being framed, identity theft, and people are being radiated to death for somethings that are not their fault. I suspect i am the victim of such fraud.

There are nations that want to see America destroyed, or are planning war against us, and are using this defense as a weapon against our brightest and best, even our political leaders are being framed and as a result being electricuted, given electrical lobotomies, as an act of terror, by countries seeing what they can do to turn our technology against us.

Jupiter 2 months ago
